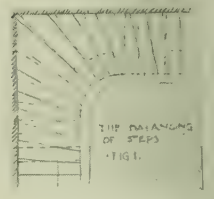
STAIRCASES

(BASED ON THE WORK OF M. GAUDET.) BY T. P. BENNETT.

THE liaison between the portions of the building which are horizontal and those which are vertical is the staircase, and it may first be studied in detail and afterwards as an element in the composition of the building. In all early architecture the construction of the staircase proceeded on the principle of direct support; that is to say, solid treads acting as lintels spanned the space between the spandril walls or were laid upon rampant barrel-vault constructions between the walls.

In Latin and Italian the single word *scala* signifies a ladder and a staircase, and it indicates the fact that early staircases were merely stone ladders. Many of the richest staircases still follow this principle, and rise from floor to floor in one continuous line. About the seventeenth century the "cantilever," or "open-newel," staircase was evolved, and as soon as this was accepted as an element of construction a very wide field of design was opened up for the architect. At present such stairs are used without hesitation, yet the time is not so very far distant when the constructor approached such a problem with trepidation.



There are various recognised rules for ascertaining the correct proportions of tread and riser; of these the most common are the "English" rule, whereby the width of the tread in inches multiplied by the height of the riser in inches should equal about 65, and the "French" rule, which states that twice the height of the riser plus the width of the tread should equal 23 or 24 in. The latter is more logical because it is based on the assumed length of tread for an average person as 24 in., and the assumption that the effort of mounting upwards is twice that involved in proceeding horizontally. Normally, the treads and risers of staircases vary between 13 in. by 5 in. and 8 in. by 8 in., and 12 in. by 6 in., 11 in. by 6½ in., and 9 in. by 7 in. are most common. There are, however, many exceptions—Table "A" giving the dimensions for some of the most monumental staircases in Paris.

This table is sufficient to show that in monumental architecture the designer endeavours to make the slope as flat as possible. On the other hand, cottage, turret, and cellar stairs sometimes reach the extreme limits of steepness. Italian staircases, notably in Rome, are even flatter than those quoted above, as is shown by Table B.

So far reference has been made solely to internal staircases. In dealing with external work the French have a word "*perron*," describing monumental stairs which approach a building having its main entrance above ground level. The existence of such a word serves to emphasise the distinction between internal and external stairs, which is quite marked. The external staircase is a piece of monumental architecture designed for comparison with the whole exterior of the building. As such, its entire composition is on a much larger scale, and the treads tend to become wider and the risers shallower; but in addition to the increase of the width of the tread on account of the need for effect there are also practical reasons, such as the danger created on steep stairs by frost and rain. The dimensions of a few external staircases or *perrons* will be of interest. (See Table C.)

When the staircases are curved the dimensions of the width and height of steps should be measured in the centre of their length, or, perhaps more conveniently, at a point 18 in. from the centre of the handrail, this being the point at which the ordinary person mounts.

In designing stairs which are partly straight and partly curved care must be taken to avoid a sudden transition from the straight to the curved portions; this can be effected by "dancing" or "balancing" steps. The French principles in these matters are sound, some being indicated in Figs. 1 and 2, which

show such a transition and also the treatment of steps at the angle of a staircase having a continuous string. It will be found in practice that it is almost impossible to design a

staircase satisfactorily where the faces of the first and last risers are more than 3 in. in front of the return string.

In a staircase of special shape, such as that in the Palazzo Barberini at Rome (Figs. 3 and 4), the treads must be carefully set out to obtain a satisfactory line for the closed string by having even spacing where the face of the riser comes into contact with the face of the string. The exactitude of the French language subdivides the English "landing" into *pallier d'arrivée* (landing of arrival) and *pallier de repos* (landing of rest). This exact designation indicates the purpose of the landing clearly, and incidentally the principle which should govern its design. It is inadvisable to design a staircase which rises more than 10 or 12 ft. without a landing, and the Board of Trade, in buildings governed by it, indicates a limit of 12 ft.; a section of the Theatre Act insists on not less than three or more than fifteen risers without a landing.

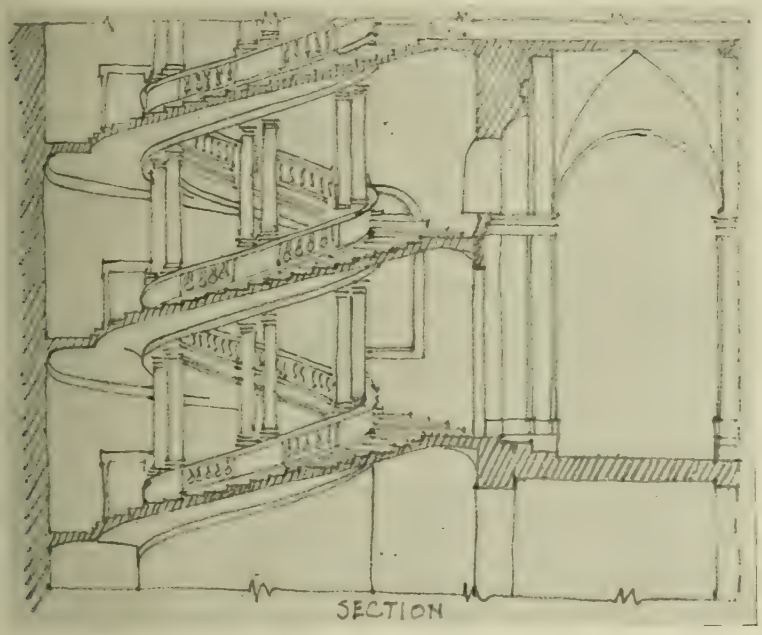

Fig. 4.—The Oval Staircase, Palazzo Barberini, Rome.

Staircases are one of the main methods of lighting well-planned buildings. In monumental buildings it is often difficult to avoid carrying a half-space landing across the face of the façade, and in some cases stairs have been well designed so that adequate lighting is obtained without destroying the continuity of the façade. A brilliant example is to be found in the wonderful staircase at the Chateau de Blois (Fig. 5). Solid steps in stone staircases were once universal, but it is now more common (and indeed better construction) to erect them in concrete, either pre-cast or built *in situ*, and to cover them with a finishing surface of cement flooring composition or stone or marble slabs. By this means the surface can be renewed from time to time without in any way interfering with the main structure.

The "open-newel" stair was at first supported by means of an elaborate system of arches; such a staircase is to be found at Versailles. Wooden stairs were carried by a combination of strings and newels, the newels forming a support from floor to floor. As the constructors of staircases became more *facile* they reduced the apparent dimensions of the strings, which then became "cut." The enrichment of the staircase is enhanced by the balustrade, which may be in stone, iron, wood, bronze, or a combination of these materials. Some of the seventeenth-century staircases built in wood have magnificent balusters cut to dimensions which would make them quite possible in masonry without alteration. There is an excellent example in Chelsea Hospital. At other times iron adds enormously to the richness of the staircase, as may be seen in an example at Hertford House, Manchester-square.

In designing monumental stairs it is well to bear in mind that the purpose of the landing, so far as appearance is concerned, is to change the angle caused by the remainder of the flight. In planning, landings should be in the centre of the room or group of rooms which they are intended to serve.

Ramps are sometimes employed instead of staircases, and in several places the London Building Act emphasises their desirability. They are, however, (1) uncomfortable, and (2) exceedingly long even for short rises. They are a necessity for bringing vehicles from one level to another, and for this reason find their use in the approach to such buildings as the Ramp du Pincio at Rome and one of the entrances to the Opera House at Paris (Fig. 6). There are purely utilitarian ramps at Waterloo and Paddington stations. The limit of slope is 1 in 10. In large gardens the ramp frequently forms a means of passing from one level to another which is at times more suitable than the introduction of steps, or, in any case, may be used with steps to gain effect. Where ramps are partly straight and partly curved it is better, if possible, to make the curved parts level. If the curve is sharp and is made to fall the inner portion must be carefully examined to see that the slope does not become dangerous.

EXHIBITION NOTES.

MR. NEW'S DRAWINGS.

The drawings by Mr. New in the new room at the R.I.B.A. will find many admirers. Mr. New has learnt something of real value from old prints, and the best spirit of them has come forth in his work. His views of Oxford Colleges are of especial value, and his clear-cut drawings are amongst the best of modern conventional drawings.

ETCHINGS.

The lover of etchings may have a pleasant time at the Fine Art Society now. Here are a number of admirable plates on view, and prominent amongst them are about two dozen by Robt. W. Allan, whose vigorous handling of pictures does not prevent his dealing with etchings in a suave and delicate manner. Two of his landscapes shown are very attractive—"Richmond, Surrey," (113) and "On the Loire, Evening" (126). The latter is a perfectly-balanced scene envisaged with breadth and delicacy. In his forcible "Loch Cornish, Skye" (121) it seems a pity that the artist has somewhat over-textured his clouds, which are heavy and opaque and rather detract from an otherwise fine plate. There are many things of special note in this exhibition, such as the telling picture of "Ebb Tide" (70), by C. R. W. Nevinson, and the pure delicacy of "The Siesta" (99), by Lee Hankey.

ARCHITECTURAL EXHIBITIONS.

Mr. Delissa Joseph writes suggesting that other architects should follow with exhibitions of their work on the lines of the exhibition at the Suffolk-street Galleries.

ARCHITECTURAL SOCIETIES

R.I.B.A. MINUTES.

We take the following notes from the minutes of the Council Meeting held on March 3 :—

R.I.B.A. Diploma in Town Planning.—On the recommendation of the Board of Architectural Education the Council approved the regulations and syllabus for the examination for the diploma in Town Planning, and appointed the following members to act as examiners :—Professor Patrick Abercrombie, Professor S. D. Adshead, Mr. E. G. Allen, Mr. Reginald Bruce, Mr. Arthur Crow, Mr. W. R. Davidge, Mr. F. M. Elgood, Mr. W. Carby Hall, Mr. W. A. Harvey, Mr. H. V. Lanchester, Mr. T. Alwyn Lloyd, Mr. W. Harding Thompson, Professor Beresford Pite, Mr. Raymond Unwin.

R.I.B.A. Prizes and Studentships.—On the recommendation of the Board of Architectural Education the Council decided that candidates who have entered for the Soane Medallion or the Tite Prize shall be permitted to submit their drawings in place of the usual problems in design required for the final examination, and that candidates who have been awarded the Soane Medallion or the Tite Prize, or who have received a certificate of hon. mention in either of these competitions, shall receive exemption from the design portion of the final examination. It was also decided to fix the age limits as follows :—R.I.B.A. Essay Prize—45 years; Measured Drawings Medal—35 years; Pugin Studentship—18-30 years; Owen Jones Studentship—40 years; Tite Prize—35 years; Soane Medallion—35 years.

Arthur Cates Prize.—The annual value of the prize was increased from £30 to £50.

R.I.B.A. Essay Prize.—Candidates for this prize will be required in future to submit to the secretary the subject on which they propose to write for the approval of the jury.

R.I.B.A. Intermediate Examination (Subject A. General History of Architecture).—Candidates who are relegated in Subject A (general history of architecture) of the Intermediate may be required at the discretion of the Examiners to take either subjects :—C.1 (*a*) Greek and Roman; or C.1. (*b*) Byzantine and Romanesque; or C.1. (*c*) French and English Gothic; or C.1. (*d*) Italian, French and English Renaissance, instead of being required to sit for Subject A again.

London Traffic Authority.—On the recommendation of the Town-Planning Committee it was decided to urge upon the Prime Minister the necessity of the establishment of a traffic authority for London at the earliest date practicable.

Building Research Board.—On the recommendation of the Science Standing Committee it was decided to request the Department of Scientific and Industrial Research to grant an interview to representatives of the R.I.B.A. to enable them to lay before the Department their views on the subject of research into building materials.

Public Telephone Kiosks.—On the recommendation of the Town-Planning Committee it was decided to urge the Postmaster-General and the Metropolitan Boroughs Joint Standing Committee to refer the proposed new standard design for public telephone kiosks to the National Fine Arts Commission for their advice before the building of these kiosks is proceeded with.

Reinstatement.—Mr. S. P. Brinson was reinstated as a Licentiate.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

On March 12 the second annual exhibition of the Birmingham Architectural Association and of the students of the School of Architecture was opened by the Lord Mayor of Birmingham, at the rooms of the Royal Society of Artists. This year 25 members of the society, which numbers 220 members, scattered over five Midland counties, and 30 students, are among the exhibitors, and their work consists mainly of water-colour and pen-and-ink drawings and pastel work. Among the members exhibiting are Mr. R. Savage (the President of the Association), who shows his front elevation design for the Masonic Temple in Broad-street, together with ground and first-floor plans; Messrs. Holland W. Hobbis and A. E. McKewan, Vice-Presidents; Mr. E. Bewlay, whose contribution takes the form of pastel drawings of various unnamed buildings and scenes; Messrs. Nicol & Nicol, who show, among other things, their designs for the Birmingham War Memorial and some Italian studies; Messrs. H. T. Buckland and W. Haywood; Mr. W. A. Harvey, who gives examples of housing schemes and lay-outs; Mr. J. A. Swan; Mr. A. L. Snow; Mr. Owen Parsons; and Mr. C. E. Bateman.

At the formal opening, in introducing the Lord Mayor (Alderman T. O. Williams), the President (Mr. R. Savage) said their object was not to advertise architects individually, but to interest the people of Birmingham in the subject of architecture. During the last few years there had been a marked increase of popular interest in this subject. People, he considered, were beginning to wake up to the fact that architecture, in common with painting, sculpture and literature, was one of the fine arts. To get better results from the profession it was necessary they should have the sympathy and support of their fellow-citizens, and it was really with that object that they were holding the exhibition. The more critical people became—provided, of course, they had the necessary knowledge—the higher would be the standard of architectural work.

The Lord Mayor, in declaring the exhibition open, said it had been an education to him to find such a variety of styles and phases of architecture as were depicted on the walls, and he hoped that those who had designed them would some day see them realised in buildings that would be monuments to their skill. He was also pleased to see drawings of places which many of them had visited—works which showed the value of the excursions abroad arranged by the Association. There was no doubt the more they travelled to see what other people were doing, the better it must be for British architecture in producing buildings which were both utilitarian and artistic. He felt sure they would see an improvement in the architecture of Birmingham, as to the need for which there was no doubt. From what he had seen, the Lord Mayor said he was satisfied that Birmingham architects could hold their own with those of any other city or town in the country.

On the proposition of Mr. B. J. Fletcher (Head Master of the Municipal School of Art), seconded by Mr. M. Rudland, a vote of thanks was accorded the Lord Mayor for opening the exhibition.

SOUTH WALES INSTITUTE OF ARCHITECTS

The annual general meeting of the Western Branch of the South Wales Institute of Architects was held at Swansea recently, when the following officers were appointed for the ensuing year: Chairman, Mr. H. C. Portsmouth, F.S.A.; Hon. Treasurer and Librarian, Mr. C. Russell Peacock, F.S.A.; Hon. Secretary, Mr. J. Herbert Jones, F.S.A.; and Hon. Auditor, Mr. Ernest E. Morgan, A.R.I.B.A.

Branch Committee: Mr. C. S. Thomas, F.S.A.; Mr. Glendinning Moxham, F.R.I.B.A.; Mr. G. R. H. Rogers; Mr. Edwin Smith, A.R.I.B.A.; Mr. Oliver S. Portsmouth, A.R.I.B.A.; and Mr. G. L. Crocker and Mr. J. C. Gower, students, and associates' representatives.

Those elected to represent the Branch on the Council of the South Wales Institute of Architects were: Mr. H. C. Portsmouth, F.S.A.; Mr. C. S. Thomas, F.S.A.; Mr. J. Herbert Jones, F.S.A.; Mr. G. R. H. Rogers; Mr. Ernest E. Morgan, A.R.I.B.A.; and Mr. G. L. Crocker, associates' representative.

LIVERPOOL ARCHITECTURAL SOCIETY.

On March 18, Professor L. B. Budden lectured on "The Relation of Architecture to Other Arts" before the Liverpool Architectural Society. In the course of his remarks he said architecture was receiving more general attention to-day than it had done for a century. This he attributed to three causes: First, the fact that architectural education was at last being established on a professional basis and so commanded public respect; second, that the work of many practising architects in England had, during the last decade or so, shown increasing power and distinction, the improvement being largely due to American influences; thirdly, that the publicity now given to architecture by means of exhibitions and critical articles in the Press had brought it into line with painting, music and the drama, as a subject that should engage the interest of all educated people.

A problem that had its own peculiar difficulties was the reconciliation of the tendencies in modern furniture design and applied craftsmanship with the claims of contemporary architecture. Professor Budden then proceeded to outline the cause of the present divorce of architecture from painting, sculpture and the crafts, and considered the consequences. In architecture these had led to architects relying for their effects on purely architectural elements of design, whilst in painting and sculpture the independent work conceived without regard to any special setting had become predominant. So specialised had the arts become that even the best painters and sculptors were usually quite ignorant of the technique of architectural composition. Without at all understanding its resources and aims they were ever ready to explain what was wrong with modern architecture and would patronisingly suggest remedies for its salvation. Architects themselves were commonly in no better plight. Only too frequently even those who were highly trained and possessed a cultivated and fastidious judgment in their own art were complacently insensible to valuable aspects of modern painting and sculpture. Sometimes they exhibited frankly bad taste and took a Philistine pleasure in doing so; in any case they were almost invariably antipathetic to the work of the younger generation of other artists.

The loss to architecture was deplorable. By being limited simply to its own resources it was denied a whole range of effects which it could only achieve by the aid of painting and sculpture conceived in sympathy with it. At present these two latter arts in their most vital modern forms paid no attention to architecture at all and were more often than not antagonistic to it.

How to bridge the gulf that divided architecture from the arts and crafts which once owed allegiance to it was the final question. Professor Budden elaborated a number of constructive proposals and indicated tendencies which seemed already to be working to that end.

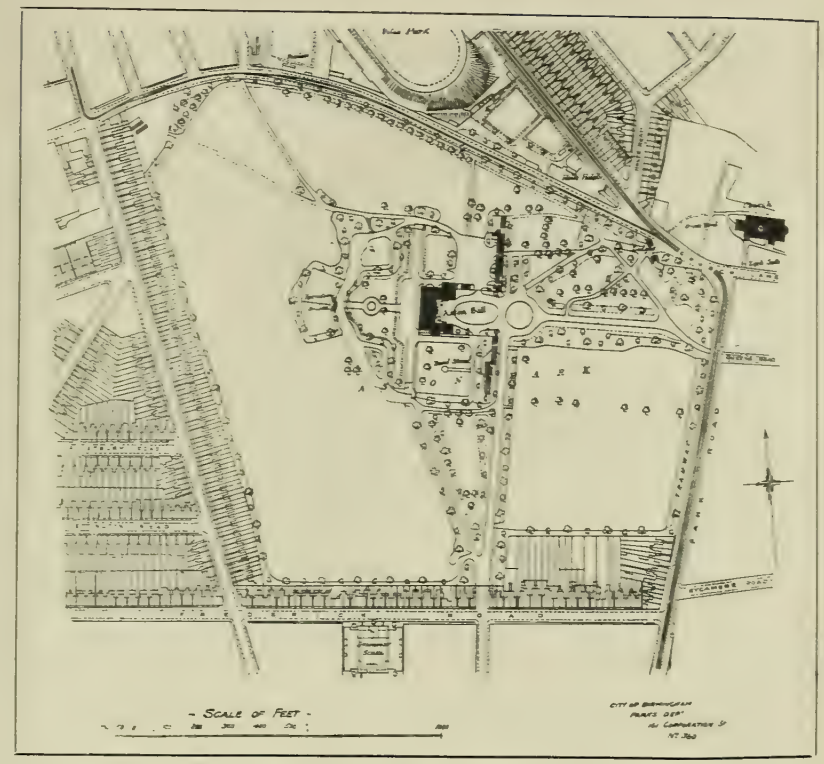
PLYMOUTH ARCHITECTURAL SOCIETY.

The annual meeting of the Plymouth Branch of the Devon and Exeter Architectural Society was held at Plymouth recently. Mr. J. Leighton Fouracre, F.R.I.B.A., presided. The reports presented by the honorary secretary and treasurer, Mr. B. Priestley Shires, showed an increase of four members on the year. The new model by-laws, after certain amendments, had been approved, and the adoption of this model set by all the architectural societies throughout the kingdom affiliated to the R.I.B.A. was proposed. The chairman, in expressing the hope that the coming year would be marked by a greater advance in the interest taken in the Society's work, mentioned that he intended to give three evenings for the study of design among the junior members.

The competition organised for the benefit of the junior members produced designs from five competitors, and the award of the adjudicator, Mr. Anstis G. Bewes, was announced as follows: (1) Mr. J. R. Millman, Plymouth; (2) Mr. E. E. Brown, Stonehouse, and Mr. F. M. Pidsley, Baldock, Herts, equal.

ASTON PARK, BIRMINGHAM

THE Birmingham Civic Society recently submitted a scheme to the City of Birmingham Parks Committee as a result of the annual inspection of the city parks, which was attended at the request of the Parks Committee by Mr. William Haywood, F.R.I.B.A., Hon. Secretary of the Civic Society. At the time the Visiting Committee accepted the offer of the Society to suggest improvement to Aston Park.

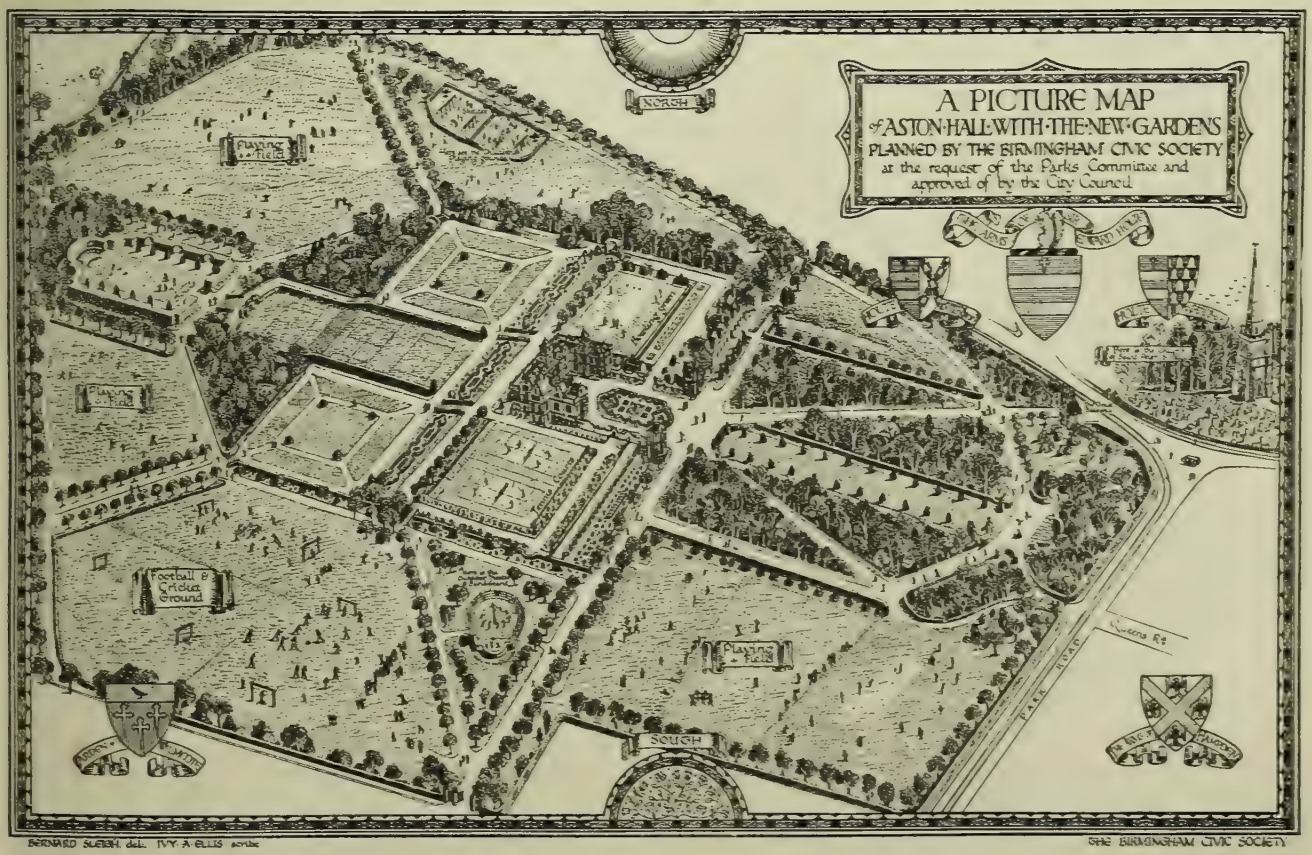


The report states:

It is impossible to deal with Aston Park as with ordinary suburban enclosures. The historical value of the hall at once claims consideration for special environment, and provides the best of reasons for a suitable difference in treatment from other public grounds, a difference which is valuable in itself and should be fully exploited.

It is not proposed to attempt a restoration of the grounds to their original character as shown on the plan of 1758. The proposal now put forward is designed to give (within the area now available) gardens which might have been contemporary with the house, because based upon the manner of garden design then in vogue.

This development of historical character in the grounds immediately about the hall has been so arranged as to break up the lower ground on the west with a view to its better control and maintenance. The hard usage of the ground which has made grass impossible at this point is provided for by covering two relatively large areas with asphalte, the chilly appearance of which is moderated by surrounding avenues and gardens; and it is thought that these avenues—each with a fenced strip of ground to protect the trees—will serve to cut off the adjoining playing fields, and so make possible a satisfactory growth of grass within the boundaries left unpaved.



The children's gymnasium and the bandstand are two of the least satisfactory details of the present park. Both are incongruous adjuncts to the hall, and it is proposed to move the former to a site near the north-west entrance, where it will adjoin the asphalted playing areas, and to construct a new music stand, stage, and auditorium, near to the south entrance, as shown on the plan.

Aston Park, Birmingham.

The revised arrangements of the gardens about the hall include vistas radiating from the east and west fronts, which would add greatly to the stately character of the mansion. One of these vistas is designed as a direct approach from the lodge entrance in Church-lane, and this approach is balanced in effect by a new route from Park-road, while the present central road is converted into a great lawn, with formal trees at intervals, and a suitably designed viewpoint as a terminal feature.

It is suggested that the formal bedding in the east forecourt and on the slope below the west terrace should be laid out with topiary work of a character contemporary with the hall; that the lawn now occupied by the bandstand should be converted into tennis-courts; that the west and south margins of this green should be planted with double herbacious borders between clipped hedges; that the bowling-green on the north front should be increased in size, and the path area be reduced as shown. These alterations are associated with a proposed blocking-up of the way down the slope at this point.

THE SURVEYORS' INSTITUTION

DISCUSSION ON HOUSING SUBSIDY AND RENT ACTS

At the last meeting of the Surveyors' Institution—the President (Mr. J. Inglis Davidson) in the chair—a discussion followed the reading, by Mr. J. Calvert Spensley, Chief Assistant Valuer of the London County Council, of his paper, entitled "Economic Effects of the Housing Subsidy and the Rent Restrictions Acts." Extracts from the paper were published in *The Builder* of March 14.

Major H. Barnes, F.R.I.B.A., in moving a vote of thanks to Mr. Spensley, said the production of houses was not a thing which could be increased with anything like the same rapidity, apart from exceptional circumstances, with which other commodities could be increased. When dealing with houses the position did not so rapidly adjust itself to market conditions. But, apart from that, there was the fact that the indispensable condition of anything like an augmented supply of houses was absent. They had not got anything like the labour that was required to meet the housing demand. In the past, so far as he could see, out of every ten men engaged in the building industry not more than one was engaged in building working-class houses—at the very outside not more than one in eight. The other seven men, if they took eight as the number, were engaged on maintenance, repairs and general buildings. They were told that those eight men had dwindled to something like four; put it at five, and at a time when they had got that depletion they got a double demand. The result could only be enormous inflation of costs, and any inflation of costs on a free market in housing must bring with it a corresponding increase in rents so long as the rents could be obtained. There was, no doubt, a margin of people to whom a subsidy made a difference, but it was not a large margin. He did not think the subsidy was playing a very great part in stimulating the demand for houses. He did not believe there was the least prospect in any period which any of them there would live to see of what had been called by Mr. Spensley a gap or chasm being closed so far as a very large section of the population was concerned. Therefore, as regarded the housing shortage, not as concerned those people who could afford to pay for houses, but those who wanted or needed houses whether they could afford to pay for them or not, he saw no prospect of the shortage being met without a considerable subvention from State funds.

Sir Theodore Chambers, in seconding, said the feeling he had had during the past four years had been that there were two entirely different housing problems—the problem of the weekly wage-earners and the problem of the salaried men and the people with a certain amount of saved capital on the interest of which they partly lived. As regarded the problem of the house of the weekly wage-earner, he had come to the same conclusion as Major Barnes, that it was impossible to expect in any time that they saw in front of them that the capitalist would again build houses to let to that class. He thought the house-owner had been put to so much difficulty by unnecessary legislation, and he had been so abused as an intolerable person, the other directions in which his capital could be put out to far greater advantage were so numerous, that he (Sir Theodore) could not conceive that private enterprise, in the sense of building working-class houses to let to the working-class people, would ever come again in their own life-time. At the present time it was perfectly true that the gap—the ability to pay of the wage-earner in this country and the economic or remunerative rent of the house which society now demanded he should live in—was too great to be bridged. He did not believe they could get round it in any way. It was true that Major Barnes, in a valuable book he had written, said it would be necessary if society demanded those conditions for the working people that the subject should be treated somewhat in the same category as education or other services which the community wished the people to obtain. Turning to the problem of the middle-class house, he thought it most unhappy that the views of the majority of the Rent Restriction Act Committee were not accepted, and the Act lifted off the houses that were brought in in 1920.

Mr. T. P. Bennett, F.R.I.B.A., said that Mr Spensley had put the cost in 1922 of a house on the Roehampton Estate as £362, which was considerably less than double the 1914 cost on the Old Oak Estate. Mr. Spensley mentioned that the prices were not exactly comparable, but the whole of his (Mr. Bennett's) investigations went to prove that it was still impossible even at the end of 1923, to erect any kind of building at approximately less than twice the pre-war cost. Mr. Spensley further said that from one-third to one-half of the increased cost was due to increased amenities and increased accommodation. If that were so, he failed to see how they could build them for £362. Mr. Spensley also stated that there was no indication that workmen at the present time were going slow as compared with pre-war times. He was sorry to say his investigations did not support that view, and he could not find any builders who would support that view. He had put the loss in output at 15 per cent. at least, and had been told it was nearer 20 per cent.

Mr. Spensley, in reply, defended his figures, and said he could find no statistical evidence of workmen going slow, and thought it only just to say he had come to a negative conclusion.

Covent Garden.

The Westminster City Council recently received a communication from the National Anti-Profiteering Society, stating that the serious state of congestion of Covent Garden Market had been before them, and they considered some steps should be taken to ensure that in the future provision should be made for better conditions than existed, and suggesting that, as it was not possible to extend the Market, the Government should take the matter in hand and the Market be removed elsewhere.

The Council recommended no action be taken in the matter.

Proposed House at Hilperton, Trowbridge. Mr. Walter W. Snailum, Architect.

[This house is to be built this spring for Mr. E. Leonard Hill, of Trowbridge. It will occupy a site on the high ground near to Trowbridge. and will command exceptionally extensive views. The walls externally will have a plinth of cherry-red bricks, above which they will be white rough-casted. The angle quoins will be relieved with red tile work, and the roof will be covered in sand-faced dark tiles. On the side opposite to the view given it is proposed to erect a large loggia, with a sleeping porch over. The architect is Mr. Walter W. Snailum, of Trowbridge, Mr. George E. Hubbard, A.R.I.B.A., being responsible for the whole of the drawings, including the perspective.]

THE LAW RELATING TO BUILDING

By W. T. CRESWELL, Lic.R.I.B.A., Assoc.S.I., F.R.S.I. (Barrister-at-Law).

VII. CERTIFICATES (2).

Necessity that Certificates should be in writing.

It was stated in a previous article that there is no legal necessity for certificates to be written, and that a verbal certificate will suffice unless the contract stipulates that certificates must be in writing. It is somewhat remarkable that forms of contract do not as a common usage include this stipulation, because it would effectually obviate the doubt and uncertainty which are always likely to arise when certificates are given orally.

Undue influence of Employer over Architect or Surveyor in signing Certificates.

The granting of a certificate by an architect and surveyor may be open to question by the contractor, if it appears that in signing it he has acted under the influence of the employer, and not in accordance with his own skill and judgment. An architect must act in the full consciousness of his dignity and responsibility as a quasi-arbitrator, and not be overruled by the wishes or instructions of the employer, if these are against the just claims of the contractor. In McDonald *v.* Workington Corporation (1892), Vol. II, Hudson on Building Contracts 228, Lord Esher said, "His duty is to give the certificate according to his own conscience and according to what he conceives to be the right and truth as to the work done, and for that purpose he has no right to obey any order or suggestion by those people who are called his masters. For the purpose they are not his masters. He is to do that on his own conscience, wholly independent of them, and to act fairly and honestly as between them and the contractor."

In Roberts *v.* Hickman (1911), Vol. II, Hudson on Building Contracts 426, it was enunciated that where an architect, in a quasi-judicial position, does not preserve that attitude of judicial independence needed and required of him to discharge his duties, though he may not be guilty of fraud or collusion, he is no longer fit to be judge; and where he does act in the interests of the employer, or by the employer's directions, the latter cannot in such circumstances rely upon the architect's certificate as a condition precedent to payment or as an adjudication binding upon the contractor. Fletcher Moulton, L. J., said "The misconduct on the part of an architect in allowing himself to receive instructions from one of the parties, and to act in that party's interest, goes to the status of the architect. It makes him incapacitated to act as a judge, and it is obvious it affects his decision on every point, and not only on the point on which you can show that he has taken a direction from either side. He is no longer fit to be a judge, because he has been acting in the interests of one of the parties, and by their direction. That taints the whole of his acts, and makes them invalid to whatever subsequent matter his decision is directed."

In the House of Lords the Lord Chancellor said:—"I agree with what Fletcher Moulton, L. J., said, but would like to add this: It is not, in my opinion, a case to which the terms "turpitude" or "fraud" are apt. I think the real error of the architect was that he mistook his position, that he meant to act as a mediator, that he had not the firmness to recognise that his true position was that of an arbitrator, and repel unworthy communications made to him by the defendants. It is undoubted that the defendants, Messrs. Hickman, tried in this respect to lead him astray in their own interests."

Architect's refusal to certify.

If an architect should expressly refuse to grant a certificate, in collusion with the employer, the courts would probably allow the contractor to proceed in an action for payment of his account, without first proceeding to arbitration. In Kellett *v.* New Mills U.D.C. (1900), Vol. II, Hudson on Building Contracts 238—there was a claim for balance of work done and extras. The plaintiff had agreed to do work for the defendants to the satisfaction of their engineer, and the defendants agreed to pay the plaintiff upon the certificate of their engineer. The engineer did not address himself to determine and certify, but wrongfully refused, or wrongfully and unreasonably delayed so to determine and certify, and the defendants took advantage of his refusal and delayed payment. Fraud was not alleged. It was held that the plaintiff could recover from the defendants without a certificate.

In Macintosh *v.* The Great Western Railway (1850), 19 L. J., ch. 374, a Bill filed against a railway company, their secretary, and engineer, stated that the plaintiff had contracted with the company to execute certain works, and that the company had agreed to pay for them in a specified manner, with a proviso that the works should not be considered as executed unless the engineer of the company should certify to that effect; and that the engineer, upon notice, should proceed to examine the works, and, if properly executed, should certify the same, and that thereupon the plaintiff should be entitled to recover; that the works had been completed properly, but that the engineer, acting under the direction of and in collusion with the company, refused his certificate. The Bill prayed a declaration that such refusal was a fraud upon the plaintiff, and for an account and payment of the sums due to him. All the defendants put in a general demurrer. Upon appeal, the decision of the courts below overruling the demurrer was confirmed. (Demurrer is a pleading which admits the facts as stated in the pleading of the opponent; and, referring the law arising thereon to the judgment of the court, waits until the court decides whether the party is bound to answer. Demurrers in the High Court are now abolished.)

An action does not lie against an architect for "negligence," if he does not grant a certificate, in the absence of allegation of fraud or collusion, either at the suit of the contractor or the employer.

If the contract provides for arbitration, their remedy—whichever of the two is the aggrieved party—is to proceed to arbitration; the court would not interfere until this provision of the contract had been complied with. If there is no provision for arbitration, it would seem that the course open to the contractor or employer is to proceed in an action against the architect and the other for collusion; or, alternatively, against the architect for breach of duty, an accusation very difficult of proof except in a case of obviously flagrant injustice on his part. See Stevenson *v.* Watson (1879) 4 C.P.D. 148, and Chambers *v.* Goldthorpe (1901) 1 K.B. 624.

In Robins *v.* Goddard (1905) 1 K.B. 294, Collins, M. R., said:—"If something which purports to be conclusive is made subject to revision, it loses its quality of finality." That is to say, the arbitration clause protects either party to the contract against the operation of any unfair dealing in this matter.

Retention Money.

Payment to the contractor is usually made by instalments on certificates given by the architect, from time to time as the work proceeds, and termed "progress certificates." Such certificates are for instalments, which in each case represent a percentage of the value of work done (this percentage is stated in the contract); so that a balance of payment is always withheld, and such balance allowed to accumulate to a prescribed amount, which said amount is designated "retention money"; and it is also usual to fix a limit of time during which retention money may continue to be withheld, a moiety being due on completion of the works and the balance to be included in the final certificate. Sometimes it is provided that interest at a given percentage shall accumulate on overdue monies.

Payments in advance.

When a contract provides for instalments in advance, upon the certificate of the architect, such progress, or interim, certificates are not conclusive, but subject to readjustment in the final certificate. It may be here noted that contractors accounts for variations must be questioned promptly when rendered (if the architect or employer has any objection to raise), or they are considered, legally, to have been accepted as correct.

Non-payment by employer.

A clause is often inserted in a contract enabling the contractor to determine the contract if certain circumstances arise, *e.g.* (1) if the employer fails to meet an interim certificate within a prescribed period; (2) if the works are stopped by the architect or a court of law for a period exceeding one prescribed; (3) if the employer has become bankrupt (or where the employer is a company and it has gone into liquidation) and the trustee in bankruptcy, or the liquidator, is unable, within a prescribed time, to carry out the contract and make payments due or likely to become due thereunder. But, in the presence of such clauses, the contractor is not alternatively entitled to an action for breach of contract; and the amount due to him is usually settled by arbitration.

If, for any other reason, the employer fails to pay, or endeavours to repudiate the contract, he may render himself liable for the profit the contractor might reasonably have been expected to make had he been allowed to complete.

In all these cases the employer is the rightful owner of all work and materials already fixed to the freehold. It is therefore only with the loose materials on the site that questions can arise as to ownership.

THE SPLENDOUR OF ROME'S PALACES

In his lecture at the Central School of Arts and Crafts recently, Sir Banister Fletcher described the palaces of the Roman Emperors on the Palatine Hill, Rome, and showed how, with the ruins on the site, it was possible, with the aid of knowledge and imagination, to reconstruct the buildings in the mind's eye so as to get some idea of the appearance of Rome in the days of the Cæsars. There Augustus was born and there he reared the first imperial palace, which was subjected to constant additions and developments by Tiberius and Caligula, Vespasian, Titus, and Domitian, while Septimus Severus also remodelled and extended the buildings, which thus became the finest palatial pile ever erected. The plan was magnificent, and there was nothing piecemeal or accidental; the whole was laid out on axial lines, which gave fine vistas, and when irregularities occurred they were masked by hemicycles and devices similar to those employed recently in the Admiralty Arch. A great portico of fluted cippolino columns led into the tablinum, or throne-room, flanked by the chapel of the imperial "lares" on one side, and by the basilica, or hall of justice, on the other. Thus, in accordance with Roman traditions and ethics, the imperial power was firmly planted, architecturally at any rate, between religion and justice. Beyond was the peristyle, or colonnaded court, for state life and pageants, and this led to the triclinium, with its three tables and couches for diners. This social sanctum, where emperors gave their banquets, remote from the business of the outer courts, was flanked by nymphæums, with flowers, fountains and running water.

It was but a step from these palaces to the humble insulæ, or workmen's tenement dwellings, where the slaves were herded together in buildings erected story over story, so that Augustus had to issue regulations limiting their height.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

**** *We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

Show Case Window.

SIR,—I am constructing an isolated show case window approximately 15 ft. by 6 ft. 6 in. by 8 ft. high, as rough sketch (see below). It is solely for show purposes, and the floor is 18 in. above the ground (cement paving), the back and one end are supported on brick piers, while the front and other end are enclosed with brick and glazed tiles. To prevent condensation on the glass in cold weather would the following be satisfactory ? :—

Ventilators through the floor in nearest board to the glass and a space left about 6 in. wide in ceiling near the glass, exposing the joists, which can be left open in the rear (as shown on sketch).

Will this prevent the trouble ? I should be glad to receive your opinion, or alternative suggestions.

C. J. NORRINGTON.

Epsom.

[REPLY.]

Your system of ventilating the show case is quite sound and should do much towards eliminating condensation. If it is convenient to run a hot-water pipe under the floor beneath the vent openings this would make things quite safe, or a single protected gas point is a great help. May we suggest that the gap in the ceiling might be better screened if a narrow frieze were interposed between the top frame and cornice ?

Cost of Ironmongery.

SIR,—We have received an inquiry as to the proportion of total cost of house under 1923 Act which goes in builder's ironmongery (pipes, stoves, window fasteners, bath taps, &c).

E. C. WARREN.

London.

[REPLY.]

It is a difficult matter to state a definite proportion of cost which goes to provide the builder's ironmongery for a house even of a particular type. Our correspondent will readily realise that the amount of piping required varies considerably with the arrangement of the plan, as will such matters as eaves guttering and down pipes. Taking a typical subsidy house costing say £500, a sum of about £95 would be required to cover the cost of galvanised piping, eaves guttering, down pipes, grates, register mantels, bath, lavatory basin, taps, cistern, cylinder, door furniture, locks and window furniture, but, as we say, this is an amount that will vary very much in individual cases.

This represents a proportion of about 19 per cent., which is relatively high for the small compact plan which the subsidy requirements impose.

Paving of Cowshed.

SIR,—Would you kindly let me have an answer to the following questions ? The proportion of sand and cement for making cement floor to cowshed. Time it should be left before being fit for use. Amount of each required to lay a floor of 36 sq. yds. and 2 in. thick.

Lincoln. R. ROGERS.

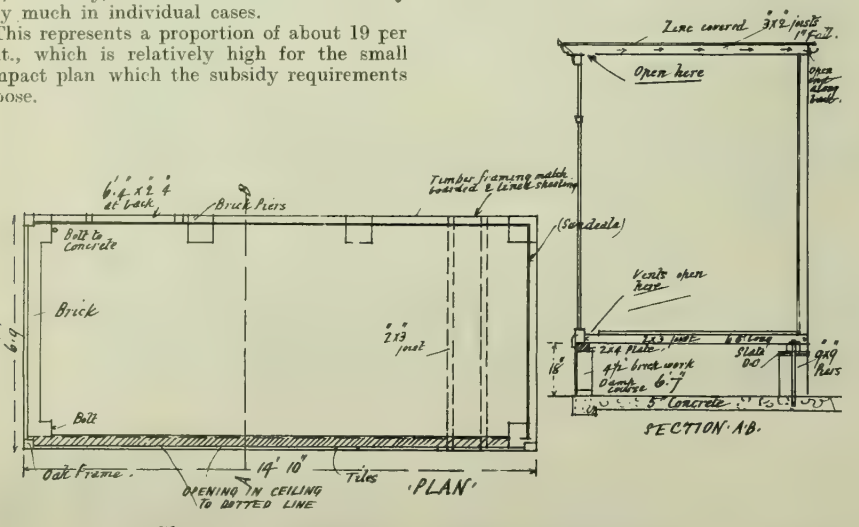
[REPLY.]

For pavings subject to fairly heavy wear it is far preferable to use granite chippings in lieu of sand, and a preliminary bed of bricks broken up on the site with a hammer (not rammed) and spread tightly packed to a thickness of 4 in. to 6 in. makes a good foundation, the slight cost of which is well repaid in the longer life of the paving. The paving should be laid in sections, chess-board fashion, or in alternate strips, each section being completed in one process, and the surface should be kept wet for seven days after laying, by the use of a watering can. Before the initial set the surface should be well trowelled to a smooth face.

The proportions for mixing should not be weaker than two parts of cement to five parts granite chippings (½ in. to dust). The surface will be fit for use about a week after the wetting process has been completed.

An area of 36 sq. yds. 2 in. thick makes up a bulk of 2 yds. of granolithic cement, but this will require 3 yds. of granite chippings and dust, as the dry material will shrink about one-third of its bulk on mixing and watering, the cement filling up the interstices and occupying no further bulk. The amount of cement required to mix with this will, therefore, be 32 ft. cube, or 16 bags of cement filled 12 to the ton. The quantities needed will therefore be : 14 to 16 bags of cement, between four and five loads of granite chippings and dust, and nine loads of broken brick.

Restoration of Old Cottages.

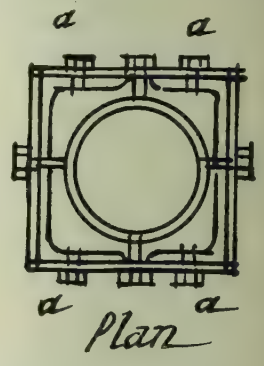


SIR,—I am proposing to alter two very charming old cottages to throw them into one small country house. They are, of course, without a damp course, and are in consequence very damp, in some places enough to rot the plastering, which will have to be stripped and renewed throughout. I had thought of cutting out and inserting a blue brick in cement damp-course, in short lengths at a time throughout, but should like to know if there is a cheaper satisfactory method. I am sure there must be many of your correspondents who have had similar problems to solve, and I should be most interested to hear their views if you will kindly give my letter prominence.

RESTORER.

Washed Sand.

SIR,—I shall be obliged if you could inform me in the columns of your valuable paper whether there is any recognised standard of size for "washed sand." The point is whether, as I maintain, "washed sand" means sand that has been washed, whether passed through a 3-16 in. screen or smaller, or whether it necessarily means sand which has passed through a 1-16 in. screen, which I am told is sometimes described as a "washed sand screen."



London. F. J. ROBERTSON.

Show Case Window. *(See Inquiry on this page.)*

Strengthening Columns.

SIR,—"Constant Reader" will find a good solution of his problem by surrounding three-fourths of the plain portions by a rolled steel box girder. If the cast-iron columns are, say, 6 in. dia., then the steel strengthening will be 8¾ in. square, made up of two 8 in. by 4 in. channels and two 8¾ in. by ¾ in. plates, thus :—

There should be 3 or 5 heights of "centering" steel set screws (4 in each plane) tapped into the steel surrounding plates and screwed just home against the column ; *a a a a* are steel studs with nuts outside—tapped into the channels. Cast-iron chairs one-eighth the height of the columns would prevent the steel surround from slipping.

Manchester. A. HENTHORN STOTT.

Hard-wearing Dado.

SIR,—Can any of your readers advise me as to the best material to use for the dado of an office stairway on which there is a considerable amount of traffic ? The considerations are wearing qualities and economy of upkeep. Mosaic or tiling are too expensive and cement needs painting.

LANDLORD.

Hospital Costs.

SIR,—Can any reader give me any information concerning the all-in cost—including the necessary nurses' accommodation, resident staff, kitchens, boilers and boiler-house, laundry, operating theatre, complete ; and the number of beds of any hospitals built in recent times or just before the war, giving the dates of erection in order that the necessary adjustment of cost to present-day prices can be made ?

HOSPITAL.

Damage by Workman.

SIR,—I shall be glad if you will kindly inform me what is the legal position where a workman, during the course of employment, causes breakage or damage by accident. Is the workman liable, or does the loss fall upon the employer ?—"ILLEGIBLE."

Roman Builders.

Mr. A. S. Walker, lecturing recently on "Old London and how to see it," in the course of his remarks said Rome was a modern city compared with London, which was founded in B.C. 1108, while Rome was not founded until B.C. 735.

In regard to the question of the City churches, the lecturer said they could show their practical sympathy with the movement to preserve these buildings by opposing any measure put before Parliament to destroy them without reference to their history, their art, or their traditions.

PRACTICAL DESIGN FOR BUILDING CONSTRUCTION—VI.

AN ELEMENTARY EXPLANATION OF THE APPLICATION OF THE THEORY OF CONSTRUCTION TO PRACTICAL DESIGN

By EWART S. ANDREWS, B.Sc., M.I.Struct.E., A.M.Inst.C.E.

SECTION II.—FLOORS AND BEAMS.

The loads upon the floors of a building are transmitted to the walls or columns by a floor system which resists the forces upon them by means of bending stresses. There is always a double, and sometimes a treble system of beams; in the case of an ordinary domestic floor, the floor boards transmit the loads to joists and sometimes these joists in turn transmit their loads to bressumers or girders. In heavier constructions the floor boards are usually replaced by reinforced concrete *slabs* and the floor joists by steel or reinforced concrete beams; if these beams do not have a bearing direct on to a wall or column or stanchion, they are usually called *secondary beams* which, in turn, are carried by main beams or girders. There are on the market a number of special forms of floors, often called patent floors, although few of them are still patented, but in any case their function is the same, namely, to transmit the loads by bending resistance either to the vertical supporting walls or columns or to the beams or girders which in turn transmit the loads to the vertical supports.

Ordinary timber floors usually have only small spans and seldom involve calculations involving a knowledge of the theory of subject. They were used hundreds of years before the theory had been developed and empirical rules based entirely upon practical usage and experience are nearly always followed.

As we shall often use the term "empirical rule" in these articles, we will explain that we use it to mean a rule that is not based upon theoretical considerations; we do not mean, as some people appear to think, that the rule is a bad one—some empirical rules are excellent. Typical examples of empirical rules relating to beams are the following:—

(*a*) To find the depth in inches of a timber floor joist, divide the span in feet by two and add two.

(*b*) To find the section modulus of a steel I beam multiply the depth in inches by the weight per foot in pounds and divide by ten.

The Strength of Beams.

Before we can calculate the load which a given beam can carry we have to make the acquaintance of a number of technical ideas, which, though not really abstruse, require studying carefully and accurately and in such a manner that we do not step up to the next stage until we are quite certain that we are fully acquainted with the one under consideration. We propose to explain these as briefly as possible but before doing so we would like to make clear that in order to investigate the strength of beams there are two quantities which we must know. The first of these is called the *bending moment* and depends entirely upon the span, the loads upon the beam, and the manner in which its ends are supported; it does not depend at all upon the shape of the beam or upon the material of which it is made.

The second quantity is called the *section modulus* and this depends entirely upon the shape of the cross-section of the beam.

If we divide the bending moment at any point along the length of a beam by the section modulus we obtain a number which represents the maximum intensity of stress in the material of the beam and, according to the material of which the beam is made, we decide whether this intensity of stress is one which the material can resist.

Stress, Strain and Elasticity.

All the materials employed in construction are *elastic* materials, although many of them are not what may be termed perfectly elastic. By a elastic material we mean one which, when a given force is applied to it, becomes deformed to a certain definite extent, this deformation not changing with increase of time and disappearing when the force is removed. The deformation which takes place in an elastic body when acted upon by a force is called *strain*. When an elastic body becomes strained forces are introduced between the molecules of the material which tend to bring the body back to its original form, and these molecular forces are called *stresses*.

The strains under working conditions are exceedingly small but they always occur, and by means of very delicate instruments called extensometers they can be measured; for instance, a steel bar 1 in. in cross-sectional area and 10 in. long, when subjected to a pull of 7.5 tons, will stretch by about six thousandths of an inch.

These strains and stresses may be of a complicated nature, but for purposes of study they may be divided into three kinds, viz.:—

(*a*) An *extension* strain corresponding to a *tensile* stress.

(*b*) A *compression* strain corresponding to a *compression* stress.

(*c*) A *slide* strain corresponding to a *shear* stress.

These are represented diagrammatically in Fig. 9.

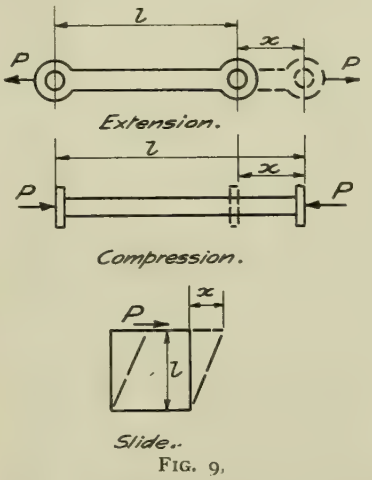


FIG. 9.

Of these the slide strain presents much more difficulty than the others, and we will not deal further with this until a later stage.

Intensity of Stress.

As we have explained above, the word stress is used in the general sense of molecular force, but we also use it in the particular sense of the molecular force acting over a unit area; strictly, this should be called intensity of stress. In the design of steel structures, for instance, we say that the safe or working stress in tension is 7.5 tons per square inch, meaning that on any one square inch of the material we can allow a tensile molecular force of 7.5 tons. In the simplest case of stress in which the stress on each square inch of the material is the same, as in a centrally loaded tie-bar, we can find the intensity of stress in the material by dividing the total force or pull in the tie-bar by the area of the cross-section of the bar.

Suppose, for instance, that a round mild-steel tie-bar is 1½ in. in diameter and is subjected to a pull of 18 tons. The area of a circular bar 1½ in. in diameter is 1.77 square inches, so that by dividing 18 by 1.77 we get the stress in the material,

$$i.e.,\ \text{stress per sq. in.} = \frac{18}{1.77} = \frac{10.2\ \text{tons}}{\text{per sq. in.}}$$

Variations of stress.—In the simplest case, as previously stated, the intensity of the stress is the same all over the section; this is indicated diagrammatically at A, Fig. 10, which represents a centrally loaded tie-bar, the lengths of the arrows which indicate the intensity of stress being all equal.

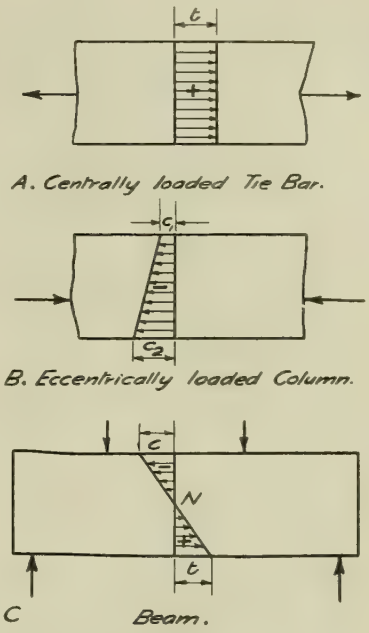

FIG. 10.

In other structural members the intensity of stress may vary gradually from one point to another. Fig. 10 (B) represents an eccentrically loaded column or structure in which the intensity of the compression stress increases gradually from the value c_2 at the top to the value c_2 at the bottom. In the case of a beam, the diagram representing the variation of stress is as shown in Fig. 10 (*c*); the upper portion of the cross-section is compression and the lower portion is in tension, the stress varying from a maximum zero at a point N, called the *neutral axis*, and then gradually increasing to a maximum value *t* in tension.

It is clear that tensile and compression stress are like in kind but opposite in sense, so that it is convenient to distinguish them by the symbols *plus* and *minus*; we have indicated the tensions as positive and the compressions as negative, but we might equally have adopted the opposite arrangement, and in some text-books it will be found that compressions are taken as positive and tensions as negative.

We shall return later to the very important question of the variation of stress in the cross-section of a beam; but will for the moment draw attention to the fact that, in the illustration given, if we added together all the tensile stresses we should find that they were numerically equal to the sum of the compression stresses, but as the total tension is opposite in sign to the total compression, the resultant of all the stresses is zero. This is true of every beam section, and explains why it is not the area of a beam section which determines its strength but another quantity called the section modulus.

Unital Strain.

In calculating strains it is usual to consider them in relation to the original dimensions of the body. Referring to the tie-bar represented in Fig. 9, in which the extension is shown to much exaggerated extent, the extension is x, and the original length is l; if we divide x by l we obtain a quantity which is called the unital strain. In the same way that when we use the term stress we often mean intensity of stress, so when we speak of strain we often mean the unital strain.

To take a numerical example, we may consider the same bar as we considered above. On

a test on a specimen 12 in. long it was found that the bar stretched .0094 in.

$$\text{Unital strain} = \frac{\text{Total extension}}{\text{Original length}} = \frac{.0094}{12} = .000783$$

As unital strength is a length divided by a length, it is a mere number or coefficient, and will not depend on the units in which the engths are measured so long as the extension and the original length are measured in the same units.

Elastic or Young's Modulus : Hooke's Law.

In a truly elastic material, the intensity of stress is proportional to the unital strain ; this is often called Hooke's Law, which is usually given as "Stress is proportional to strain." If, for instance, we find that with a certain intensity of stress we have a certain unital strain, then by doubling the stress we will double the strain. This means that the intensity of stress must always be a certain number of times the unital strain, and this number is called an elastic modulus, and in the case of tension and compression it is called Young's Modulus, and it is denoted by the letter E. Another way of defining this is by the relation : Young's Modulus = E

$$= \frac{\text{Intensity of tensile or compression stress}}{\text{Unital tensile or compression strain.}}$$

If our stresses are measured in tons per square inch, the value of E will be in tons per square inch, and if the stresses are measured in pounds per square inch, the value of E will be in pounds per square inch. In testing many structures we cannot actually measure the stress in the material, but we can measure the strain, and thus by a knowledge of Young's Modulus we can calculate the stress. For mild steel E is about 30 million pounds per square inch, or about 13,300 tons per square inch.

One of the remarkable things about steel is that although its ultimate or breaking tensile strength varies within wide limits, according to the chemical composition of the steel and the heat or mechanical treatment to which it has been subjected, the value of Young's Modulus hardly varies at all. One method of defining Young's Modulus, which some students find easier to understand, is that it is "the stress that would cause a bar to stretch to twice its original length." This will be understood from the above definition, because if a bar stretches to twice its original length, the extension will be equal to its original length, and therefore the unital strain will be

$$\frac{\text{extension}}{\text{original length}} = 1 ;$$

in using this definition, however, we should remember that with no structural material is it possible to stretch it to twice its original length.

VICTORIA AND ALBERT MUSEUM

Chinese Sculpture.

This museum has recently acquired an early Chinese statue in dark grey limestone. The figure, which is life-size, represents the Buddha Amida, seated cross-legged. Behind the head is a large circular halo, decorated with elaborate floral designs of a type derived from Indian Gupta sculpture, retaining considerable traces of colour on the surface of the stone. The statue, which is a characteristic example of the great Buddhist art of the T'ang dynasty (A.D. 618–906), is probably the finest piece of Chinese stone sculpture that has yet reached this country. It is temporarily exhibited on the staircase leading to room 62.

Jacobite Wine Glasses.

The large collection of English glass on exhibition has been augmented by a collection of about fifty pieces. These pieces (including two rare decanters) consist exclusively of glasses engraved with portraits, mottoes, and emblems commemorative of the Jacobite cause and date from the middle and second half of the eighteenth century.

THE RENT BILL IN COMMITTEE

The suggestion made in Committee on the Rent Bill that control should be made a question of local option so far as the county boroughs are concerned shows the loss of perspective which has arisen in the public mind in connection with the control of one class of private property in what is supposed to be the public interest. This tendency has been apparent ever since control was instituted in the height of the war ; the private interests are entirely lost sight of, and any nostrum for house shortage is put forward without due consideration.

To make the local authorities who are responsible for pushing forward the housing schemes and for furthering housing generally the arbiters of whether private property should be controlled for uncertain periods, would be making them judges in their own cause and enable them to cover their own deficiencies by continuing to fetter the property and action of private owners of property in their districts. Truly the old proverb might be paraphrased and read, "Those whom the gods desire to destroy, they first turn to rent control." We are glad to see, however, that the only representative of the Government apparently present on the Committee advised the Committee against accepting this amendment, which he characterised as "hopelessly impracticable."

It is useless saying that what we have always asserted would be the case has come to pass, and that the protection for so long a period of one class of sitting tenants would practically create vested interest, and when decontrol either partial or complete was attempted, those vested interests would make a great outcry and hard cases would be made out in every case where a protected tenant was called upon to face the conditions which the many unprotected persons have had to endure for many years.

Whenever the question of rent decontrol comes up these people, who have been saved anxiety during the war, and for nearly five years after its termination, make their voices heard throughout the land and desire to be permitted to live on their landlords ; and the position has been accentuated by the fact of control itself, for that control has put an end to the letting of houses, and, therefore, they cannot when evicted find any other houses to rent, and to this extent they have a grievance. The ill-advised and too long continued policy of rent control has sown the seeds for a harvest which is now being reaped, but it is not too much to say that the difficulty will never be got over until the normal conditions of landlord and tenant can be re-established. It is impossible for the whole population to own their own houses, the principle of leasing must exist, and if control had been limited as soon as possible at the termination of hostilities, private enterprise would have stepped in again and the business of building and letting houses would have again been set on foot.

As it is, every year a new Act is introduced to discourage it, and the landlord is treated as the sport of circumstance, with the inevitable result that he has withdrawn from the enterprise altogether, and we are faced with a growing population which can only rent their houses, but with no houses for them to rent, except the fixed minimum still subject to control. The question must be approached with wider vision than has prevailed since control was instituted, and the private letting of houses must be encouraged instead of penalised, for otherwise the only prospect is the continuance of control, until eventually the only houses that will be available to be taken on lease will be those being built by the local authorities, and private enterprise and private landlords will be a thing of the past.

RENT CONTROL

The Minister of Health, the Right Hon. J. Wheatley, M.P., received recently a deputation consisting of Mr. E. J. Churchman, President, Mr. Edwin Evans, Vice-President, and Mr. M. Cheverton-Brown, Hon. Secretary, of the National Federation of Property Owners and Ratepayers of Great Britain, together with Mr. J. Cameron (Greenock), Vice-President of the Scottish Federation, and Mr. P. Gilmour, President of the Glasgow Branch of the Federation.

The deputation urged that Mr. Gardner's Bill, which is at present in Standing Committee, was premature in view of the short experience of the working of the Act of 1923 ; that the continuation of control was reducing the capital value of small house property almost to vanishing point so that no intelligent person seeking an investment would nowadays invest money in small working-class property ; that the provisions in the Bill restricting the right to possession would make it practically impossible for owners under any circumstances to get possession of their houses ; that the reduction in the permitted increases, as was shown by careful calculations they had made, was not justified by any reduction in the cost of repairs or mortgage interest ; that the effect of bringing houses decontrolled under the 1923 Act again into control would be to stop the tendency among property-owners to give up holding houses for sale when they became empty ; and that to take away from landlords their share in the profit derived from the sub-letting of controlled houses was to undo the concession of a principle which they had got recognised by Parliament and to which they attached more importance than to the trifling amount of money they derived from it.

The Minister in reply said that he realised very clearly his responsibility to see that justice was done all round. The landlords were not responsible for the change in social conditions which had made, and would keep, the owning of small house property unremunerative. He hoped that out of the present conflict some method of protecting them during the transition period would be found, and he would do his best to see that they were protected. He did not agree with the principle that the gradual removal of control would lead to a gradual increase of rents, and thus to a return to the pre-war conditions under which 95 per cent. of working-class property was owned privately. He agreed with the view of the majority of the deputation that there was no reasonable expectation that circumstances would arise to make this possible. He pointed out that the Bill at present before the House of Commons was not a Government Bill. It would be necessary for the supporters of the Bill to make their case good. Their case was that by comparison with 1920 the landlords' expenses had fallen to such an extent as to justify the reduction proposed in the Bill. The Government's attitude was that they approved the Bill in principle ; would assist with legal advice in Committee ; and would move amendments if they thought it desirable to do so ; and if the Bill emerged in what seemed to them a satisfactory form, they would not feel obliged as they otherwise would to introduce legislation of their own. The question was, however, urgent, as although the number of evictions was not greater than in normal times before the war, there was now no margin of empty houses into which evicted tenants could remove, and public opinion would not tolerate their being thrown into the streets. He promised to give the fullest consideration to everything that had been put to him by the deputation.

Builders' Estates.

Mr. William Mooney, of Oxford-street, Liverpool, formerly carrying on business in School-lane, Hanover-street, and Manesty-lane, Liverpool, as a plumber, painter and joiner (net personalty £33,331), £40,562.

Walter Broadbent, of Leeds, builder (net personalty £1,830), £26,371.

TOWN-PLANNING INSTITUTE

Mr. T. H. Mawson (President) took the chair at a meeting of the Institute on March 14 at the Institution of Mechanical Engineers, when Mr. F. M. Elgood dealt with the subject of "The Model Clauses: Buildings and Building Lines."

Mr. Elgood said that of the six parts into which the Model Clauses were divided Part III, relating to buildings and building lines, was the most varied in relation to its importance and comprehensive in its effect. It contained the principal provisions upon which a scheme would stand or fall according as it benefited the community in the future or impeded its fair development. Indeed, it was conceivable that many a scheme might be complete in itself if it never travelled outside the scope of what was suggested by this part. It was not to be thought, however, that any such partial exercise of town-planning powers was contemplated or was satisfactory, especially as the trend was all in the direction of enlarging the area of schemes to bring in a wider range of vision and to pay less heed to parochial or other arbitrary boundaries. When the time came, however—and the sooner it came the better—to deal with the whole of the country in a regional manner, as had, or was being, attempted in South Yorkshire, South Lancashire and many other districts, it would probably be found that there would be greater necessity for careful consideration of this phase of the subject in the subsidiary areas than for any other.

To be effective under all conditions, it was generally conceded that "zoning" was of three kinds, although only two in the Model Clauses were so described, viz., character and density zoning. There might be good reasons in some schemes, however, to have varying height zones, that was to say, certain entire areas where the limits of height were perhaps considerably less than would be generally allowed, such, for instance, as where it might be necessary to preserve the amenities of a view point; or when to retain scale in relation to an existing feature it might be desirable to define an area with exceptional height limitations. It was, perhaps, too much to suppose it would ever be expedient even if possible to prescribe a minimum height, and yet for certain purposes, taken in conjunction with a possible clause governing architectural effect—not to be found in the Model Clauses—such a power might be very effective.

Of all provisions in the earlier town-planning schemes, those which showed the greatest variation were probably in respect of the method of determining the application of density zoning. It was one thing to talk about 10 or 12 houses to the acre and another thing to explain how the limitation was to be applied. It was, perhaps, hardly necessary to compare the various methods which had been suggested for defining a "land unit." Such a comparison was doubtless made when the Model Clauses on this subject were settled, and the latter were evidently based on certain well-defined principles, of which the more important appeared to be: (1) The utmost elasticity is permitted as to the size of a land unit and the time when it is determined; (2) the local authority acting in its discretion is to have the determining power to fix the land unit when the time arrives; (3) a method is adopted by which the detailed development of a land unit can be approved by means of plot plans; (4) ample provision to be made for the variation of land units and plot plans; (5) appeal to the Ministry against decisions of a council.

The first of these points as to the size of the land unit was qualified by the maximum area being limited to seven acres, and the second by the requirement that a land unit must be contained wholly in one density zone. Land given or required for public open spaces might, at the council's discretion, be included in the land unit, and this would be perhaps one of the most useful means of bargaining with an owner for obtaining small amenities and even larger open spaces on favourable terms.

Commenting on the first principles on which the density zoning provisions were based, Mr. Elgood could not see why the definition of a "building unit" was not included amongst others in the interpretation clause. He had been unable to discover a clause which specifically made it incumbent upon a builder to have the land unit determined, except where dwelling houses and residential buildings were to be erected. An important and intentional omission was any provision for limiting the number of buildings on any single area.

Opinion as to how far it was desirable or practical to determine in advance the development of areas for specific uses, to the exclusion of others, seemed now to have become more or less crystalised. The principles on which town planners would act would vary, of course, in degree, but the first essential was to consider what was, what was likely to be, and what ought to be, the predominant use of the zone concerned. As a whole he thought the Ruislip-Northwood map was a pretty strong example of what he might call the compulsory method. Without deciding whether this was under all, or any, circumstances good or bad, the framers of the Model Clauses had provided what it was hoped was a workable method of proceeding by stages, *i.e.*, zoning on broad lines in the first instance, and narrowing the zones and their uses later by supplementary orders. There would, of course, be frequent instances where it might be advisable at once to confine certain areas to specific uses only, but those would probably be small both in number and in extent. If they looked back, say, a couple of generations, and realised the changes of character which had occurred, not only in streets, but in whole localities, they might well feel that for schemes to be as rigid as the covenants in a Crown lease would bring down to town planning an evil reputation.

The table of character zones in clause 28 was admittedly illustrative only of possible types. It wanted a lot of study to enable one to understand the reasons for the five divisions suggested, and he thought it not unlikely that when one commenced to zone the areas of a scheme a good deal of time and temper might be saved by putting on one side the model types and commencing quite independently to place their own description upon the character of the zones and the building to be permitted.

Unless it be Zone V, and Zone I suggested itself as that which would cover the widest areas in most schemes, but few districts would be likely to be satisfied with this as the only zoning provision for residential areas; although buildings for noxious industries were altogether excluded it could not assuredly be considered as unwise, even at the inception of most schemes, to secure that in certain residential areas owners might have complete reliance upon their being free from the introduction of any kind of industrial building, and perhaps even of shops and business premises. This did not in any way qualify the satisfaction he had expressed as to the elasticity offered by the power to grant or withhold consent for such buildings, nor as to the power to make supplementary zoning orders, but councils might make just as big a mistake, if encouraged to zone too timidly, or too vaguely in the first instance, as if they zoned too rigidly. It seemed to him, therefore, that there might well be a sub-division of Zone I. where certain other kinds of buildings as well as buildings for noxious industries were definitely excluded. It seemed worth consideration whether Zone II might not also be subdivided, so as to provide for what was in the Ruislip-Northwood scheme, called "optional" shopping areas, *i.e.*, where either dwelling houses or shops might be built without the consent of the council. Zone III, with its limitations, seemed entirely good, but with regard to Zone IV he hoped it would be included in few schemes, for it was almost the negation of town planning. The provisions as to supplementary zoning were of a sufficiently drastic character. They would presumably be inserted in all schemes as they stood.

It was decided by the meeting to deal with the remaining part of the paper, which referred to the height of buildings, space about buildings, and building lines, at the next meeting.

Mr. Thompson in opening the discussion touched on the point of height restriction, and said that whilst the author had suggested there might be height restriction for the purpose of he preservation of view, yet general restrictions of height were primarily to secure conditions of height in regard to sunlight, and second to secure as far as possible æsthetic conditions. He thought that the use of a limiting angle of light, which meant the restriction of the height to the width between buildings, would secure both objects.

Mr. C. P. Lovelock (Carshalton) observed that the regulations were remarkably comprehensive, and he thought it wise in view of the fact that districts very quickly varied in character.

Professor P. Abercrombie characterised this section of the Model Clauses as entirely unsatisfactory, and he was utterly disappointed. Of the five zones two were the very negation of town planning. As town planners they must take their courage in their hands and say what the areas in a town were to be used for, and if they made mistakes the town-planning scheme must be amended. There was one type of building which ought emphatically to be excluded from certain zones, and that was the house, but under the Model Clauses, with the consent of the council, houses could be erected in any type of zone. Even after putting forward the five zones it would be possible under the provisions for supplementary zoning to undo everything which had been adopted. It was giving loopholes everywhere, and watering down town planning to practically nothing at all. The speaker also objected to the limitation of the land unit to seven acres, and instanced a case where, with a site of 20 acres, it was only possible to build on eight owing to the steepness of the slopes. If the 20 acres were made one land unit the site could be utilised for housing, and safeguards provided to prevent the vacant land being built over.

Mr. Platt (Manchester) pointed out that under the Salford Corporation Act of 1902 power was obtained to prevent the erection of any houses in a certain area. It was the case of land near to the Ship Canal which was largely occupied by railway lines.

Mr. A. E. Mirams (Bombay) said he had acted as arbitrator for 60 town-planning schemes in the tropics, and he thought the Act he worked under offered more benefit to the community than the English Town-Planning Act. He objected to the whole principle of land units, and believed they could meet the difficulties by limiting the number of houses to the acre, or limiting the percentage of the building plots to be built upon. Then it was absolutely essential and vital that any scheme, to be a reasonable scheme which would appeal to the owners and to the public, should have provision made for subsequent alterations. As town planners they might say a certain area should be a residential area, but it was possible that no one would want to live there, and conditions so changed that in 10 or 20 years it might be highly desirable to have shops in the area.

Mr. H. V. Lanchester, F.R.I.B.A., said that when he read the clauses he felt in a strong mood of philosophic anarchy. He had hoped in the early days that town planning was going to give them imaginative force instead of by-laws. By-laws produced nothing but mediocrity, and if they were going on piling them up town-planning schemes would be almost as mediocre as the state of things which existed before. He was against constructive work being controlled by those

measures. When one went to work in places where there was freedom they said, "This is common sense; hang the by-laws," and then they got results. By-laws of this kind could not take the place of common sense in the handling of their problems, and he had almost a feeling of resentment that their great art was going to be snowed under by this appalling and increasing aggregation of rules and regulations which were fatal to their imaginative work.

Mr. E. R. Abbott said the Ruislip-Northwood scheme had been in operation for 10 years, and there had been only two slight alterations with regard to roads. They had succeeded in putting down strictly proposals for buildings which would have spoilt the whole aspect of the area.

Mr. Reay Nadin remarked that if they were to carry out some of the views expressed then there was no need for town planning at all. He agreed with Mr. Abbott, who, after all, had more experience of a town-planning scheme in operation than any of them.

Professor S. D. Adshead said he must object to the autocratic statements put forward by Mr. Mirams in his advocacy of free town planning. He supported what was said by Professor Abercrombie as to seven acres not being sufficient for a land unit. The whole root of the matter was that the real requirement was to have the right sort of personality to prepare a scheme and to enforce it.

Mr. R. H. Aldridge said that the experience of Ruislip-Northwood and the first Birmingham scheme showed that given the exercise of wisdom a scheme could be devised which would stand the test at any rate of 10 years' time. Personally, he felt it would be better for local authorities to take the Ruislip-Northwood and Harborne schemes and go through them and endeavour to apply them to their own particular areas.

THE WEEK IN PARLIAMENT

Westminster, *Wednesday.*

Trade Facilities and the Brick Industry.

During the discussion on the Trade Facilities Bill, Mr. Franklin suggested that help should be given under the Bill to the brick-making industry. If the price of bricks could be cheapened, he said, they would be able to get the cost of housing somewhere near the price which the Government thought desirable.

Mr. Percy Harris said he knew the case of a company which actually did put forward a very sound proposition to develop the cement industry which at present in this country was almost a monopoly. One of the difficulties in building houses at present was the high cost of cement.

Revaluation of House Property.

Major Moulton asked the Chancellor of the Exchequer whether, in the event of the Rent Restriction Bill becoming law, a revaluation of house property effected for the purposes of rating and taxation would be made; and whether such valuation, if made, would be given retrospective effect.

Mr. Snowden said that there was no provision in the existing law under which, in the circumstances mentioned, a general revaluation of house property could be required to be made for the purposes of rating and taxation. Generally, the revision of rating valuations was a matter for the local authorities, but outside London any ratepayer who was aggrieved by the valuation list in force might, under Section 1 of the Union Assessment Committee Amendment Act, 1864, give the Assessment Committee, at any time, notice of his objection to the list, and as regarded Imperial taxation there was a general statutory right to a reduction of an assessment in force for any year where it was shown that the annual value of the property for that year was less than the value adopted for the purposes of assessment.

Density of Houses.

Mr. Wheatley informed Mr. T. Thomson that he proposed, in connection with future approvals of housing schemes submitted by local authorities, to require the authorities to submit to him any proposals for building at a density exceeding twenty to the acre.

Evictions.

Asked by Mr. Palmer if his attention had been called to the distress caused in many parts of the country by the issue of orders for eviction of tenants under the 1923 Rent Restriction Act, Mr. Wheatley said he was aware that there were a number of cases of eviction under the Rent Restriction Act of last year. The Government were generally in favour of the Bill which was now before a Standing Committee, and their future action would depend upon the progress made by that Bill and the form in which it emerged from the Committee.

Output of Bricks.

Mr. Wheatley informed Mr. Lumley that the present output of bricks was variously estimated at between 2,500 million and 4,000 million a year. Taking 20,000 as the average number of bricks per house, a total of 4,000 million bricks would be required for 200,000 houses.

Prices of Sheet Lead.

Mr. Wheatley informed Sir Kingsley Wood that the present London prices, compared with those in March of last year, of sheet lead and white lead paint were as follows, viz.:—

	Sheet Lead. per ton.	White Lead Paint. per ton.
March, 1923	.. £38 0 0	.. £80 15 0
March, 1924	.. £47 10 0	.. £86 10 0

The increase in cost of a non-parlour house on account of the rise in cost of lead, including lead pipes, during this period would be, approximately, £2 17s. There were, in this country, various associations in the lead industry, which included among their activities the fixing of selling prices. They did not, however, control the price of pig lead, which was imported to the extent of about 94 per cent. of its use in this country. The price of pig lead had increased by £8 per ton during the last twelve months.

Repair of Houses of Parliament.

Lieut.-Colonel Howard-Bury asked the First Commissioner of Works whether his attention had been drawn to the uncompleted and damaged turrets outside the Palace of Westminster; and whether, in view of the great numbers of visitors that were expected this year from the Dominions, he would have them completed.

Mr. Jowett said that the answer to the first part of the question was in the affirmative, and he was considering the whole question of the repair of the stonework of the Houses of Parliament, which presented many difficulties. In the meantime, he was merely removing detached and dangerous portions of the masonry.

Building Materials.

Mr. Wheatley informed Mr. McEntee that no evidence that manufacturers of building materials had at any time enforced higher prices against municipalities than against private builders for such materials had been brought to the knowledge of his Department.

Sir Kingsley Wood asked whether the Committee on the cost of building material was still carrying out its duties, and whether he proposed to give any additional powers to the Committee.

Mr. Wheatley said that the question whether there should be any extension of the scope and powers of this Committee was under consideration; in the meantime the Committee was continuing to obtain information as to changes in the prices of materials.

Mr. Snowden (Chancellor of the Exchequer) informed Mr. Sullivan that, so far as he was aware, no material used for building purposes was liable to Customs duty on importation into this country.

State Costings Committee.

Sir C. Cayzer asked the Minister of Health whether he proposed to set up a Costings Committee with a view of keeping control on materials and dilution of labour used in building houses for the people to the same extent as was done successfully in providing munitions of war.

Mr. Wheatley said that the questions of cost of materials and of augmentation of labour were engaging the attention of a Joint Committee of employers, operatives and manufacturers engaged in the building industry, and he awaited their report before deciding what further action might be required. In the meantime the Committee to survey prices of materials was continuing the work for which it was appointed.

Mr. Oliver asked the Minister whether he would consider the setting up of a Costings Committee for the purpose of controlling the price of building material, so that the rents of new houses would be as low as possible.

Mr. Wheatley said that this was one of the questions which was engaging his serious attention. It would be dealt with in the proposals he hoped to submit to Parliament in due course.

St. Paul's Bridge.

Mr. Gosling (Minister of Transport) informed Sir E. Iliffe that a grant, limited to a maximum of £866,000, had been offered from the Road Fund, with Treasury sanction, towards the cost of formation of road approaches to the proposed St. Paul's Bridge, including the widening of the whole length of Aldersgate-street as and when opportunity offered. He was not in a position at present to give any estimate of the probable total cost of the bridge and approaches.

Skilled and Unskilled Workers.

Mr. T. Thomson asked the Minister of Health if he had formed any estimate of the relative proportion of skilled to unskilled men employed on the erection of any given number of houses of the "A" and "B" types.

Mr. Wheatley said that the proportions would vary somewhat with local circumstances, but on the average the relative number might be taken to be in the proportion of three skilled men to two unskilled.

Non-payment of Rent.

In reply to questions as to whether he would take steps to safeguard from eviction unemployed who could not pay their rents, the Prime Minister said that such powers would have to be granted by legislation, of which there was but little prospect. The position was undoubtedly getting serious in some industrial centres, especially where wide combinations of house owners had been formed. He hoped that consultations now in progress by the Secretary for Scotland would result in municipal policies that would temporarily meet the case. The question of rents was now occupying the attention of the Standing Committee.

Consolidation Bills.

Lord Muir-Mackenzie, on behalf of the Government, has introduced in the House of Lords two Bills to consolidate enactments relating to the housing of the working classes in England and Wales and Scotland. The Bills have been read a first time.

Obituary.

The death took place recently of Mr. Charles Holland Lancaster, of "Lingfield," Blundellsands-road East, Blundellsands, who for over forty years was Architect and Rating Surveyor to the West Derby Union. Mr. Lancaster was seventy-two years of age, and during his term as a public servant he was responsible for the erection of many of the buildings connected with the institution, including the Alder Hey Hospital and the Sanatorium, Heswall.

THE BUILDING TRADE

ESTIMATING FOR SMALL BUILDERS

By J. H. BARNS, F.I.O.B.

POLISHING.

In considering the question of the cost of French Polishing, some description of the various methods of the work must be given as there are so many kinds. Previously to polishing the wood it is customary for the joiner to damp the surface of the hardwood because it makes his work of glass-papering easier, and causes the grain to rise so that it may be cut down with glasspaper to the smooth surface required for polishing. The damping-down will usually tend to remove any bruises on the wood caused by machine work.

Immediately upon applying polish to any hardwood it causes the grain of the wood to rise, however smooth it may have been beforehand. It is therefore necessary to glasspaper the surface in between each coat. The cheapest way is to brush over the wood with two or three coats of shellac and spirits (a thin polish), which may be described as brush polish, although the quickest way of doing this work is to apply the polish with a pad of wadding instead of a brush, though it would still be called brush polish. The ordinary polishing of hardwood, such as mahogany, is usually done to two different styles of finish, the ordinary method and the open grain finish.

By the ordinary method the wood is first of all stained with some kind of stain, usually bichromate of potash, and afterwards filled in with plaster (dental plaster). When this has dried it is rubbed down with glasspaper, to remove the surplus plaster and cut down the surface of the wood which has now become roughened. Only sufficient plaster is left on the wood to fill in the pores and to present a level surface. Linseed oil is then applied. The polish, being in the nature of a varnish, is applied to a wad of cotton-wool covered over with a clean rag, and as this is rather apt to stick during rubbing, and to facilitate the working, a little linseed oil is applied. The more linseed oil there is used the easier the working, but if much linseed oil is used it comes through the polish and soon presents a very dirty appearance. A rubber of polish is then applied, and further glass-papering and further polishing, going over and over the wood as many times as is desired—sometimes from nine to twelve separate operations or occasions are necessary to bring the wood to the required surface.

To state the matter briefly, the ordinary polishing consists of staining, filling, oiling, a fad of polish, first body, second body, etc., and stiffen off to finish. To obtain a good result, power and friction are necessary in the rubbing. If materials are simply floated on as for brush polishing they quickly sink into wood and present a dull appearance. What is considered one of the arts in polishing is to match up the wood so that it presents a uniform colour, as most hardwoods present quite a different shade if seen from different angles, and it is this colouring up of the wood which makes the differences in colour of the wood less marked.

The open grain method of polishing is similar to the above, but the filling with plaster is omitted. The various tones which are required in some of the different classes of wood are often obtained by the use of different polishes, whether button, garnet, red, or white.

A very cheap method of polishing is to give the wood a coat of oil or spirit stain, and then give it one fad of polish. This is often applied for cheap polishing to oak. Ebonising on mahogany is similar to the ordinary methods of polish, except that a black polish and stain are used instead of red polish.

French polishing is used for both interior and external work, although in the case of external work it does not stand the weather for very long, the reason being that the coat of polish (which is really in the nature of a varnish) is so very thin that it affords very little protection to the wood. Sometimes brown hard varnish is used in the polishing for external hardwood, but unless this is very carefully applied it is apt to crack.

The amount of material used is comparatively small, but this will largely depend upon the time elapsing between each operation or coat, as if a day or two is allowed to lapse between each coat, less material is required, and a better finish is usually obtained. A polisher will use between two and three pints of polish in eight hours, and about a quarter of a pound of rags.

The cost of the french polishing is approximately 1d. to 1½d. per foot super per coat, or per operation (neither of these is a polisher's phrase), so that if a really good class of work is required, and the polisher went over the surface nine times, it would be worth about 1s. 2d. per foot super. The cost of full polishing for any kind of hardwood is between 7d. and 1s. 2d. per foot super. An American filler has been introduced to the market which is intended to take the place of the plaster filling to the surface of the wood. The advantage seems to be that it does not cause the grain of the wood to rise, and therefore does not need so much rubbing down afterwards as would the plaster coating. In practice the filler is fairly satisfactory, and it may be used to advantage in polishing or staining veneered work.

The following are a few of the materials for polishers:—

Orange Polish	per gall.	17s. 6d. to 21s. 9d.
Button	,,	17s. 6d. to 21s. 9d.
Dark Polish	,,	15s. 0d. to 19s. 6d.
Garnet	,,	15s. 0d. to 19s. 6d.
Red or Rosewood	,,	21s. 0d. to 24s. 9d.
Ebony Black	,,	21s. 0d. to 24s. 9d.
White	,,	20s. 0d. to 24s. 9d.
Methylated Finish	,,	6s. 0d. to 7s. 0d.
Best Brown Hard Spirit Varnish	,,	9s. 6d.
Best White Hard Spirit Varnish	,,	8s. 9d.
Pi-Chromate of Potash		lb. 1s. 6d.
Oxalic Acid		,, 1s. 6d.
Plaster		per bag 10d.
White Rags		per lb. 1s. 3d.
Coloured ditto		,, 8d.

The cost of cleaning and re-polishing old work will depend upon the condition of the work. The cleaning would cost about 1½d. or 2d. per foot, and the re-polishing from 2d. to 6d. per foot. Reviving with furniture polish would cost much less.

If the polished work is in a very bad condition it may be necessary to strip off the old polish with soda, etc., bleach the wood with oxalic acid, re-stain and re-polish the woodwork, and the cost would be similar to new work, say, 8d. to 1s. per foot. Wax polishing to floors from 2d. to 6d. per foot, and will depend upon the degree of finish required. Wax polishing is usually required for walnut and oak, and would cost about 2d. to 4d. per foot super. The usual method is to give one fad of ordinary polish, and then finish either with beeswax or paraffin wax. The idea of giving one fad of polish under the wax is to stop the wood from bleaching, as otherwise the walnut is rather apt to go yellow, although this is an effect which is sometimes sought after.

INDIGENCE, INDUSTRY AND INDOLENCE

In the three words we have placed at the head of this note are comprised three of the main problems of the day. In the centre is industry, upon which in the long run the nation must really depend and which must be assiduously cultivated. To the left is unemployment—that is, unavoidable unemployment—for which the Government has yet been unable to suggest a remedy which will not hopelessly clog industry. To the right is one of the weaknesses common to human nature, but which is capable of being propagated and increased if the incentive to work is removed and comfort can be assured without work. It is not too much to say that the future of the nation depends upon the right solution of the problems involved in these three words in our heading but if they are treated separately as in water-tight compartments, then such a solution is impossible.

The Minister of Labour has declared that unemployment is as much a national responsibility as the payment of interest on War Bonds, and has also expressed sympathy with a motion that a living wage is the first charge upon industry. In connection with uncovenanted benefit he also intimated that the regulations seemed framed to pass everyone through one sieve, and considered that every unemployed person should be treated as a perfectly honest and honourable person receiving benefit as a right and not as a charity.

These are three of the latest pronouncements on the subjects of Indigence, Industry, and Indolence, and taken separately they may appear not unreasonable, but how are they to be put into practice? Industry has to bear the burden of the other two, and what contribution is made to encourage the growth of the parent plant?

Utopia can be built up out of the nation's capital for a limited time, but taxation carried to an undue extent saps the capital and cripples industry. This is a time for great circumspection and not a time when we can endeavour to set our house in the perfect order we should wish to see it in in normal times.

The question of a minimum wage is coupled with the inequality of wages in different trades and cannot be dealt with satisfactorily without considering the abnormal competition in certain industries from foreign depreciated exchanges

The unemployed cannot be given the same support as they can derive from work, for some incentive must be left to exertion, and the existing trade of the country will shrink as the burden of taxation for unemployment is increased. Without impugning the honesty of any individual, assistance can only be given to any person of any class with circumspection.

The three subjects are inextricably bound together, but the greatest of the three is industry—that is the constitution of the patient—and it is useless for the nation's doctors to concentrate on his secondary ailment before strengthening his constitution. When once that has been done the rest will follow, but at present the doctors seem absorbed in the secondary ailments to the exclusion of the main problem. Palliatives are of no use and economy and patience must be exerted until world conditions become more normal; but vast expenditure on palliatives will certainly only hasten disaster.

In connection, however, with the question of palliatives, may we say that we regret that the great scheme of Unemployment Insurance, which was in normal times a contributory and self-supporting system, should have been tampered with even to meet a crisis. We should have thought it was better to leave this great and satisfactory scheme untouched and to have provided for the national emergency from unemployment by some special and independent scheme.

INSTITUTION OF STRUCTURAL ENGINEERS

INSPECTION OF MATERIALS.

On March 20 Mr. H. J. Davey lectured before the Institution of Structural Engineers on this subject.

At the beginning of his theme he quoted the following extract from actual copies from current quotation forms issued respectively by British and Continental steel works:—"Inspection to be final, as no responsibility can be accepted for such material after it has left the sellers' works. Where testing or inspection has to be done, the buyer must make the necessary arrangements for this to be carried out as soon as possible after receipt of advice that the material has been rolled. All bars from which test pieces have been taken must be accepted by the buyers if complying with the specification of tests. For material under $\frac{5}{16}$ in. thick, bend test only will be given in accordance with the British standard specification for such material," and said the clause forming an integral part of such forms might, therefore, be regarded as binding upon each signatory to the contract. On the one part a supplier would guarantee that material supplied by him under a contract complied with the terms of the specification, and on the other part the consulting engineer or architect would discover by his own or independent inspection and testing that a greater or lesser part was unfit or even unsafe to be used in a structure. He would then reject the material, call upon the supplier to withdraw it, and to replace with material conforming to the specification.

Certain recognised steps would follow. The supplier would produce copies of his own tests, and disclaim responsibility for tests taken elsewhere. The test results produced by the supplier would without exception comply in every respect with those specified: a very satisfying document, in fact. Both parties, neither eager for litigation, and both anxious for progress with the structure, might, after lengthy and highly technical correspondence, agree upon an independent authority for final reference and would abide by the result. All of which was lengthy, costly, and not conducive to good business relations.

The inspection of structural steel was best begun at the ingot stage, although, in point of fact, it was rarely offered for inspection before being finished and sawn to length, plates excepted. Ingots allocated to plates were rolled into slabs which were generally allowed to cool for subsequent re-heating and rolling into the finished article. During the ingot phase some indication might be noticed of the presence or otherwise of external or internal defects such as spills or laminations. Spills were clearly discernible in the hot ingot and bloom stage in the form of black patches of different sizes. These patches were separations of metal from the solid body, and they did not "roll out," but persisted through to the finished bar, section or plate. They occurred more frequently in bar and section than in plate. Laminations—sometimes termed "fractures"—in the finished plate were indicated when the ingot, or, at second stage, the slab, separated partly during the early passes. The causes and prevention thereof concerned the metallurgist; the ultimate effect concerned the inspector, and owing to the indeterminate surface indications of internal lamination considerable care was necessary even for an experienced man to detect this very serious defect. Where, however, separation had been noticed during the ingot or slab stages no hesitation should be shown in condemning the steel for structural work. "Ringing," *i.e.*, striking the plate with a metal hammer, would usually disclose the presence of separations, but this test was not an infallible guide. Spills could be detected readily in ingot, bloom or billet stages of manufacture, and the material so affected should be eliminated by inspection at either stage. Possibly this was attempted at rolling mills, but the frequent appearance of the defect in finished material should demonstrate to works inspection departments that more stringency in the early stages might obviate rejection of material after all the work of rolling and length cutting had been done.

Roll marks, discernible in the form of longitudinal lines, were not usually of serious moment since no separation of metal occurred, but patches of slag or oxide adhering to rolls would cause ugly marks on the finished material, and in the case of sheet bars, intended for re-rolling into sheets, rejection was desirable, otherwise the appearance of the finished sheet would be spoilt, apart from the possibility of such patches inducing local weakness. There was apparently a fixed belief, especially in Continental rolling mills, that "spilliness" in the finished material was of no particular importance; in any case of insufficient importance to warrant rejection. When rejection for the presence of this defect was contemplated attempts would be made to rectify the bad spot by a vigorous application of a cold set. Sometimes a "rectified" section was put forward with as much as $\frac{3}{16}$ in. thickness of metal chipped away from the web of a joist mid-length, or the tension flange of a beam due for holing near the bad spot. Works foremen resented the rejection of material which by drastic chipping away exposed nice bright shining steel in place of a spilly spot. Not all spills, however, were serious enough to justify rejection; men of equally wide experience were likely to differ in their verdict on this point. The current British standard specification for structural steel devoted only one short clause (No. 2) to this important phase of inspection—the detection and classification of defects. Clause No. 2 stated:—

> "All finished steel as sent from the mills shall, subject to the provisions of Clause 18, be well and cleanly rolled to the dimensions, sections and weights specified or required, shall be sound and free from cracks, surface flaws, laminations, rough, jagged and imperfect edges and all other defects, shall be finished in a workmanlike manner, and shall in all respects comply with the tests and requirements herein mentioned applicable to the description of material (*e.g.*, plates, sections, bars, rivets, &c.), required or specified."

A literal interpretation of the clause in the absence of an exact definition of "surface flaws, rough, jagged and imperfect edges, and all other defects," would lead to the rejection of all sectional material ever rolled or ever likely to be rolled. A reasonable and safe decision could only be arrived at by inspecting engineers of long and diversified experience. Such experience matured slowly. Bad shapes in beams were a not infrequent cause for rejection. It was not necessary to labour the point to an audience of structural engineers who would be aware of the trouble caused by flanges out of square with webs.

Rolling margins were not often exceeded in British mills, but check weighings of heavy sections were always desirable. Continental mills, however, often claimed greater margins than plus or minus 2½ per cent., and instances had been known where medium heavy joists contracted for to British standard specification had been rolled 10 per cent. light, the loss usually being in depth of joist where the absence of metal was presumably of the greatest importance. Most Continental rolls were, naturally enough, machined to metric sizes, and their coincidence with British dimensions were less frequent as the section became heavier. Hot rolled round bars—reinforcing rods, for instance—were generally free from serious defects, although spilliness occurred here in common with sectional steel. Diameter limits were usually imposed by consultants in addition to quality tests, but modern bar rolling practice in Great Britain had reached such a pitch of perfection that limits plus or minus 2½ per cent. in weight presented no difficulties in bars ¼ in. diameter and upwards.

Continuous mills of the Morgan type turned out remarkably uniform rounds from $\frac{5}{16}$ in. to 1½ in. diameter, and where defective billets were weeded out by previous inspection it was a pleasure to inspect the finished bar, which compared favourably with any similar rolling in the world.

ANNUAL DINNER.

Major James Petrie, O.B.E. (President) presided at the annual dinner of the Institution of Structural Engineers at the Criterion on Monday evening. About three hundred members and guests were present, including the Rt. Hon. the Earl of Birkenhead, the Rt. Hon. J. R. Clynes (Lord Privy Seal), H.S.H. le Duc de Chateau-Thierry, Mr. P. G. H. Fender, the Rev. F. H. Gillingham, Mr. Phillip Connard, A.R.A., Col. H. V. Kent, Mr. E. J. Buckton, Sir Henry Tanner, Sir Charles T. Ruthen, Brig.-General M. Mowatt, Mr. J. Mitchell Moncrieff, Mr. W. H. Patchell (President of the Institution of Mechanical Engineers), Mr. J. I. Davidson (President of the Surveyors' Institution), Mr. L. R. Ford (President of the District Surveyors' Association), Mr. H. T. Holloway (President of the London Master Builders' Association), Mr. H. Matthews (President of the National Federation of Building Trades Employers), Mr. E. Fiander Etchells, Dr. Oscar Faber, O.B.E., Mr. R. J. Barratt, Mr. E. J. Partridge (President of the Society of Architects), Mr. C. McArthur Butler (Secretary of the Society of Architects), Mr. A. Goddard (Secretary of the Surveyors' Institution), Mr. H. Kempton Dyson, Mr. Gower B. R. Pimm, Mr. J. T. Saunders, F.R.I.B.A., Mr. A. S. Spencer, Mr. E. Monkhouse, Mr. Ewart S. Andrews, Mr. J. H. Beaumont, Mr. H. B. Newbold, Mr. Harold H. D. Anderson, Mr. Maxwell Ayrton, F.R.I.B.A., Mr. E. Vincent Harris, F.R.I.B.A., Sir Malcolm McAlpine, Mr. E. J. Tanner, F.R.I.B.A., Mr. T. J. Gueritte, Sir F. G. Rice, Dr. J. S. Owens, Mr. M. G. Kiddy (Secretary), Mr. S. Bylander, Mr. Ormond Anderson, Mr. E. O. Williams, Mr. P. M. Stewart, Mr. Herbert E. Brooks, Mr. George Earle, Mr. W. H. Morgan (County Engineer, Essex), and many ladies.

In reply to the toast of "His Majesty's Ministers," proposed by the President, Mr Clynes, referring to the industrial position, said both employers and employed should try to reach a point of mutual agreement before resorting to strikes or lock-outs. The Labour Government was anxious to inculcate the spirit of arbitration, which was the British spirit as opposed to the Prussian spirit of strikes and lock-outs. Peace, rather than force, would be as beneficial in the intimate affairs of Britain as it would be in the affairs of mankind the world over. That spirit of fair play was as strong in the minds of the workers as in the minds of employers. The Government appealed for a greater measure of reason, and that industrial troubles should be settled by arbitration rather than by force. And just as they on the labour side asked that reason should prevail, so employers were entitled to ask that lightning strikes and suddenly-sprung demands should cease.

Sir Charles Ruthen proposed "The Guests," to which the Earl of Birkenhead and Mr. P. G. H. Fender responded. Lord Birkenhead said, considering the fact that the Government was now composed mainly of men who had risen from the ranks of the workers, it was not so certain that there was anything fundamentally wrong with the institutions of a country which had given such opportunities for talent to rise from such difficult beginnings and environments.

"The Institution" was proposed by the Rev. F. H. Gillingham, and replied to by the President, who said it was their ambition largely to increase their membership this year.

Notice of Removal.

On and after Thursday, March 20, the general offices (26, Portugal-street), and warehouse (57a, Carter-lane), of The Library Press, Ltd., will be transferred to new and larger premises at 83, Southwark-street, London, S.E. 1.

NEW BUILDINGS IN LONDON

Queen Anne's-gate. — Redecoration. — The interior of 26, Queen Anne's-gate is being re-arranged and redecorated, the general contract being in the hands of Messrs. Holloway Bros. Among the sub-contractors are: Messrs. Alliance Electrical Co., electric light, &c.; Messrs. Rosser & Russell, heating and hot-water supply; Messrs. Fenning & Co., marble paving; Messrs. Benham & Sons, ranges; Express Lift Co., passenger lift; Messrs. John Bolding & Sons, sanitary fittings; The "Veitchi" Co., Ltd., composition floors; Messrs. Henry Hope & Sons, skylights. Messrs. Detmar Blow & Fernand Billerey, 10, Grosvenor-road, are the architects.

Regent-street.—Building.—A new building is now being erected at 94–98, Regent-street. The sub-contractors are: Constructional steel-work, Messrs. David Colville & Sons, Ltd., Glengarnock; Portland stonework, Messrs. The Bath & Portland Stone Firms, Ltd.; hollow block floors and roof, Messrs. Horace W. Cullum & Co., Ltd., King's Cross; metal casements, Messrs. W. James & Co., Willesden; artificial stone staircases, Mr. W. Baxter Elliott, Lewisham; asphalting, Messrs. The Ragusa Asphalte Paving Co., Ltd., 25–27, Oxford-street, W. Mr. S. Gordon Jeeves, 4, George-street, Hanover-square, W., is the architect. The builders are Messrs. Ford & Walton, Ltd., of Kilburn.

ACTION BY BUILDING CONTRACTORS

Henry Boot & Sons (London), Ltd., *v.* Uttoxeter Urban District Council.

In this case, heard on March 5, the defendants appealed from the judgment of Mr. Justice Bailhache in favour of the plaintiffs, who brought the action to recover damages for alleged breach of contract in connection with defendants' housing scheme.

The plaintiffs were the contractors for the erection of 154 houses for the defendants under the scheme, by a contract dated October, 1920. Plaintiffs complained that in January, 1922, the defendants, when only about seventy houses under the scheme had been completed, gave them notice of their intention to terminate the contract. The plaintiffs maintained that the notice was invalid, as not being in accordance with the requirements of the contract; while the defendants contended that the notice was a valid one, having regard to the fact that, as the Ministry of Health had only allowed the Council £75,000 for seventy-five houses and gave the Council notice that the number of houses to be erected under the scheme was to be limited to seventy, the plaintiffs were bound by it.

Mr. Justice Bailhache held that the notice was not a time notice as required by the contract and therefore was invalid. He, however, said he regretted having to come to that conclusion, because in the circumstances he thought it was an eminently reasonable notice for the defendants to have given. He accordingly entered judgment for the plaintiffs for £5,000 damages with costs, and from that result the defendants now appealed.

At the conclusion of the arguments, Lord Justice Bankes gave judgment allowing the appeal, holding that the notice in question was such as was contemplated by both parties when they entered into the contract.

Lord Justice Scrutton concurred.

Lord Justice Sargant, however, dissented, holding that the notice was bad, as it did not enable the plaintiffs to know with certainty when the obligations under the contract would be determined.

By the majority of the Court, therefore, the appeal was allowed with costs, and the judgment of the Court below set aside and entered for the defendants with costs.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½

(For rates of wages in the Building Trade in Scotland, see page 478).

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

✱March 31.—**Wakefield.**—Architectural Assistants the office of the Education Architect required by the est Riding Education Committee. The Education epartment, County Hall, Wakefield.

Density of Houses.

A circular recently issued by the Ministry of ealth to housing authorities in England and ales deals with the density of houses.

In a circular, issued on August 14 last, the inion was expressed that a density of approxi-ately 12 houses per acre represented a desirable andard, and that as a general rule, a local thority should not approve the building of ore than 20 houses on any one acre.

"This question," the new circular states, has now been further considered, and, while cognising the necessity of some elasticity in ew of the varying conditions in different stricts, the Minister desires that in future the cal authority should submit for his approval y case in which it is proposed to build houses to grant a subsidy for houses with a density of re than 20 houses on any one acre. Develop-nt work should not be begun by local authori-s and certificates should not be issued to ending builders until the Minister's approval s been obtained. The Minister desires at the me time to re-affirm the view that a density approximately 12 houses to the acre repre-nts a desirable standard." In regard to bsidies for building outside the district, the cular states: "In some cases, local authorities ve found it desirable to subsidise the building houses outside their own districts. Where s is done the local authority should be careful notify the local authority of the district in ich the houses will be built, in order to viate the possibility of the issue of certificates both authorities in respect of the same uses." Copies of the circular may be pur-ased directly from H.M. Stationery Office. ice 1d.

PRICES OF BUILDING MATERIAL.

The Chairman of the Committee appointed by the Ministry of Health to survey the prices of building material has recently issued his report, together with the following covering letter:—

To the Right Hon. John Wheatley, M.P., Minister of Health, and the Right Hon. Sidney Webb, M.P., President of the Board of Trade.

Sirs,—I beg to submit herewith a schedule showing the prices of building materials for the months of January and February, 1924. Following the course adopted in my last report I have set out in full the figures for January, but for February I have only recorded the prices where there has been a change since the previous month. I have again set out, for the purposes of comparison, the prices for April, 1914, and April, 1923.

Between December and January there were no appreciable changes of general application to which attention need be drawn, but it will be seen that since January there have been advances in the price of bricks, ranging from 6d. to 5s. per thousand at Bristol, Manchester. Newcastle, Swansea, and Glasgow. It is further reported from Swansea that the supply of bricks is limited.

There has been a continuance of the rise in the price of lead, to which I have drawn attention in previous reports.

There have been a number of other local fluctuations, of which the most noteworthy is an increase in the price of slates at Edinburgh and Glasgow.

I have the honour to be, Sirs,
Your obedient Servant,
H. J. Mackinder, *Chairman.*

SHEFFIELD MASTER PLUMBERS' ASSOCIATION.

The Sheffield, Rotherham, and District Master Plumbers' Association held their annual dinner recently at Sheffield.

Mr. G. E. Marlow, the President of the Sheffield, Rotherham, and District Building Trades Employers' Association, in proposing the toast of the Plumbers' Association, said it was very necessary that the plumbing business should be controlled by highly practical men, particularly seeing what an important part they had to play in the public health. He was very pleased to see the interest they took in the technical training of their apprentices.

In reference to the shortage of houses, Mr. Marlow mentioned that the building industry intended to get as many apprentices as it possibly could. He appealed to the master plumbers to see that they were not "let down," and to apprentice every boy whom they could get. It was nothing short of a scandal that they had so many people gathered together in houses, and it was necessary that they should apprentice as many boys as possible in order that the housing question could be dealt with.

Responding to the toast, the President (Mr. G. A. Simpson) said the Master Plumbers' Association was not a combine for keeping up prices. Its members all worked independently. One of their main objects was to protect the trade from falling into the hands of unqualified men.

Mr. A. Wylie then proposed the toast of the "City and Trade of Sheffield." to which Mr. R. J. Gordon responded. He paid a tribute to the way in which the Association looked after the technical education of their young craftsmen.

The toast of the West Riding Federation of Master Plumbers' Associations was proposed by Mr. S. H. Uttley. He said some people maintained that there was no need for these Federations, but there was, when they remembered that the plumbing craft bought nearly everything from combines and trusts. If they wanted lead they had to go to the lead combine, and if they wanted metal they had to go to another trust. And so the thing went on right the way through, and they had at the end of it fairly highly-paid labour, which he did not regret so long as they got value for money. They could not build cheap houses under those conditions, and the public should realise this and not blame the master plumber as some of them did. He owed it to the lead combine to mention its generosity in connection with the technical schools. The combine had realised that it had a duty to apprentices, and had agreed to supply lead for the educational authorities practically for nothing.

Mr. G. Wood responded.

The toast of the "Visitors" was submitted by Mr. J. Baxter Corrie, and replied to by Mr. T. Brown, the head of the Sheffield Education Committee Plumbing Classes.

WEST SUSSEX BUILDING ASSOCIATION.

The West Sussex Building and Allied Trades Employers' Association held their annual dinner recently at Littlehampton.

The chair was taken by Mr. H. W. Seymour (Bognor), the outgoing President, and he was supported by Mr. H. W. Bowen (Surveyor to the West Sussex County Council), Mr. Joseph Jubb (Clerk to the Bognor Urban District Council), Mr. J. Draper (Surveyor, Bognor), Mr. J. O. Holt (Chichester), Mr. E. A. Ryan (of the Employment Exchange, Worthing), Captain F. P. Twine, M.B.E., M.C. (Worthing), Mr. Walter C. Patching (Worthing), Mr. E. Taylor (Secretary), Mr. H. G. Williamson, Mr. M. Linfield, Mr. Harry Linfield (Littlehampton), Mr. A. Linfield (Bramber), Mr. R. E. Booker (Surveyor of the East Preston District Council), Mr. W. James (Arundel Park Estate), Mr. A. Booker (Bognor), Mr. W. J. Horton, and Mr. H. Briggs (Bognor).

After the usual loyal toasts, that of "The Association" was given by Mr. Jubb, who said that there was no doubt that the organisation was one that was sadly needed in the county. They knew that in the south organisation was rather slower than in the north, but in all cases of trades and manufactures he did think that organisations of that kind were both necessary and utilitarian. The advice of the architects and builders at a conference was valuable, and the result was that he thought they would have by-laws which would satisfy the builders of the town at large so, they would see in that way their organisation had come in useful.

In response the Chairman said the time had come when they must realise the need of federation, especially in the South of England, and it must be taken into serious thought. They knew little of the federation in the Southern Counties, and did not know really what it meant, but in the early future they could not ignore these organisations; they would have to put their backs into it if they were to hold their own. New things were coming along with a new Government, and time would prove whether they were to be detrimental or beneficial to the trade.

The toast of "The Visitors" was given by Mr. Walter C. Patching, who prophesied that they had a very bad time to go through, but their troubles could be considerably lightened. The professional element could, and surely would, help them in a material degree. It was in their power in every-day business life to assist the federated builder. He thought that all things being equal the federated man should have the preference, for it was he who was bearing the heat of the day. Of the unfederated man he would suggest to him in the first place that he ought not to be outside the federation, he ought to be in helping them.

PROPOSED NEW BUILDINGS & OTHER WORKS *

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

Tidying Birmingham.

A number of Birmingham residents were recently fined 2s. 6d. each, under a new by-law, for littering the streets with paper.

THE SCOTTISH BUILDER

HOUSING, &c., ACT, 1923: BUILDING BY PRIVATE ENTERPRISE.

The Scottish Board of Health has issued the following circular, signed by Mr. Alex. M'Kinna, the Housing Secretary, to local authorities:—

"As some misapprehension appears to exist on the point, I am directed by the Scottish Board of Health to explain that, in terms of Section 2 of the above Act, subsidy is payable only in respect of houses the erection of which has been begun subsequent to the date of the Board's approval of the local authority's scheme. Where, however, prior to that date but subsequent to April 25 last the erection of a house has been commenced on the faith of an assurance given by the local authority that the plans were in order and that the house when completed would be eligible for any subsidy which the local authority might subsequently determine to give, the Board are prepared to agree to subsidy being paid on being satisfied as to the date and terms of the said assurance. In each case, however, an application accompanied by a statement of the facts should be made for the Board's approval."

Montrose Bridge.

At the second conference of the Montrose Town Council and Forfar County Road Board held recently at Montrose, the question of Montrose Suspension Bridge was discussed. Alternative plans for the widening and strengthening of the bridge at an estimated cost of about £40,000, and for the erection of a new bridge at an estimated cost of £88,000, had previously been submitted to the Ministry of Transport, whose representative at Edinburgh replied that the proposal to erect a new structure commended itself to him as being the more suitable one, and added that "it is probable that a grant in excess of 50 per cent. of the estimated cost would be made." The present conference was in favour of a new bridge being erected, provided a grant of not less than 75 per cent. is given by the Ministry, a motion to this effect being made by Provost Foreman, who contended that Montrose Bridge was not only of local but of national importance. Colonel Stewart Fothringham remarked that Montrose Bridge was part of the great road scheme from Edinburgh to Aberdeen, and must be taken into account. A deputation was appointed to interview the Ministry of Transport, and an endeavour was made to get Sir Henry Maybury to visit the bridge.

New Bridge at Dumbarton.

At a recent meeting of Dumbarton Town Council, Provost Garrick presiding, the manager of the L. & N.E. Railway Company wrote stating that to substitute an overhead bridge at Silverton for the present level-crossing would cost £6,200. The structural work of the bridge and the approaches would cost £2,200 and the railway company were prepared to meet that cost and pay a sum of £900 if the Town Council would bear the expense of the remainder of the work, each party agreeing to maintain their respective parts. The Provost said the arrangement the company proposed was one they could not hope to better. It was agreed to remit the matter to the Roads and Bridges Committee with powers, and to apply to the Unemployment Grants Committee for a grant.

Obituary.

The death took place recently of Mr. Elphinstone Forrest, a well-known Glasgow building contractor. Mr. Forrest, who was 65 years of age, was a native of Glasgow, and he set up business in the city as a building contractor over 20 years ago. During the war he undertook a large amount of Government work, and was responsible for the construction of Rothesay Hospital. In recent years several housing schemes were carried out by his firm including the Glasgow Corporation ventures at Greenhead and Coplawhill. Mr. Forrest was at one time President of the Scottish Contractors' Association, and a Deacon of the Incorporation of Masons.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

PROPOSED NEW BUILDINGS

(*Continued from* p. 476.)

conversion into flats, 31, Lansdowne-place; Messrs. F. T. Wilson & Sons, for Mrs. A. L. Wherry, bungalow, Langdale-road; Mr. H. W. Sanders, for Mrs. E. Degg, bungalow, Erroll-road; Mr. F. C. Axtell for Miss E. Rose and Mrs. J. Barnes, house, Hove-street; Mr. B. James for Mr. W. Cooper, conversion into flats, 2, Eaton Villas; Messrs. Dumbrell, Turner & Wells, for Mr. Rice, bungalow, Erroll-road; Mr. W. Whiteman for Mr. L. M. Hotton, house, Glebe Villas; Mr. F. C. Axtell for Mr. S. Lorie, conversion into flats, 49, St. Aubyns; Messrs. Turner & Wells for Mr. B. A. Pigott, bungalow, Erroll-road; Messrs. Dumbrell, Turner & Wells, pair semi-detached houses, Erroll-road.

KING'S LYNN.—Plans passed by T.C.: Four semi-detached houses, Loke-road, for Messrs. Foreman & Sons; house, Loke-road, for Mr. T. Ollett; house, Vancouver-avenue, for Mr. R. Woodbine; six semi-detached houses, Vancouver-avenue, for Messrs. T. Ives & Sons; four semi-detached houses, Vancouver-avenue, for the King's Lynn Gas Company.

KIRKCALDY.—The Council's waterworks are to be extended, at an estimated cost of £85,000.

LONDON (GREENWICH).—Eight houses, Shooter's Hill-road, for P. B. Dannatt.

LOWESTOFT.—Plans passed by T.C.: J. Knights Jones, shop and house, Beccles-road; E. Lacon & Co., new licensed house, Water-lane; J. M. Barnard, bungalow, Cotmer-road; A. Mitchell, additions, "The Lodge," Hall-road, Oulton Broad.

LYNMOUTH.—Ashington Colliery Co.'s development plans have been approved for a new hotel at an estimated cost of £12,000. The Colliery Co. also propose to complete the erection of 800 houses during the next two years.

LYTHAM ST. ANNES.—The T.C. are considering the provision of a suitable site for a public cemetery within the borough, instead of utilising the site off Clifton-drive North.

MACCLESFIELD.—The R.D.C. have approved plans for the erection of nine houses at Poynton.

MALLING.—Plans passed by R.D.C.: Bungalow at Mackenders-lane, Eccles, for Mrs. C. Baker; bungalow, Pilgrim-road, Trottiscliffe, for Mr. J. E. Woden; bungalow, at Blue Bell Hill, Burham, for Mr. J. F. Kane; bungalow, Birling-road, Snodland, for Mr. L. Perkins; house, Ham Hill, Birling, for Mrs. P. Eastwood.

MANCHESTER.—Plans passed: House, Spring-gardens, Didsbury; house, Clinton-avenue and Park-field-road, Withington; house, Clowes-street, Withington; house, Wilbraham-road, Chorlton-cum-Hardy; house, Rye Bank-road, Chorlton-cum-Hardy; six houses, Egerton-road South, Chorlton-cum-Hardy.

MARGATE.—Plans passed by T.C.: House, Lower Northdown-road, for G. Pettman; five houses, Lower Northdown-road, for C. R. Elcome; house and garage, Laleham-road, for Wiles Bros.; house, Ethelbert-road, for C. S. F. Palmer.

MILNROW.—Plans have been approved for a house in Shaw-road, New Hey, for Mr. G. M. Parker; and a pair of villas, in Buckley Hill-road, for Mr. A. Ogden.——The E.C. Sub-Committee reported that an arrangement had been made with the Newhey Co-operative Society to lease from them a plot of land in Berry's Mill-road, for the erection of a transformer sub-station.

MONMOUTHSHIRE.—A public meeting held at Pontypool has authorised the U.D.C. to press forward its scheme to widen George-street.——The Rhymney U.D.C. has referred to its Housing Committee a proposal that 90 additional Council houses be erected, and is considering the erection of a public abattoir.——The Mynyddislwyn U.D.C. is to apply for tenders for the erection of stores building for the electricity department.

MUNDESLEY.—Bungalow, for Mr. G. Cheeson.

NEWPORT (MON).—The question is being considered by the B.C. of the construction of a swing bridge alongside the temporary bridge.

OLDHAM.—Plans passed by T.C.: A. Kershaw, 8 houses, Melling-road; G. B. Hardy, house and shop, corner of Manley-road and Langham-road; J. Makin, eight houses, Lynn-street.

PEMBREY.—The Carmarthenshire E.C. has given notice to acquire land to erect a new school.

PEMBROKESHIRE.—The Narbeth Council is to put in hand at once the work of erecting new Felinfach bridge and the construction of Vicar's Mill; Vargwr and Maenclochog bridges will be put in hand immediately plans have been completed.

PENARTH.—The U.D.C. has applied to the M.H. for sanction to put in hand at once the work of reconstructing the pier.

PENMAENMAWR.—Plans passed by U.D.C.: Two houses in Treforris-road, for Messrs. Henry & Lowe; two houses on Esplanade, for Messrs. Hughes & Lloyd; house in Station-road East, for Mr. J. Sambrook; three houses off Celyn-street, for Major J. R. Williams; six houses in Marlandir Isaf, for Mrs. Cemlyn Jones.

PONTEFRACT.—The Central Miners' Welfare Fund has made a grant of £7,500 to the Pontefract Miners' Welfare Scheme for the conversion of "Thornycroft," a large residence in Halfpenny-lane, into an up-to-date institute. The estate, including the residence and other buildings, is six acres in extent.——Plans passed by T.C.: Two houses, Swanhill-lane, for Mr. T. W. Hill; lay-out of building estate, for the exors. of the late Mr. B. Hartley; 13 houses, Knottingley-road, for Mr. D. Cockshaw; bungalow, Halfpenny-lane, for Mr. F. W. H. Holmes; bungalow, Halfpenny-lane, for Mr. E. H. Clarke.——Plans passed by R.D.C.: Twelve houses, Orchard-place, Glasshoughton, for for Mr. H. Roper; house, Whiteley Bridge, for Mr. A. F. Lindley.——The Yorkshire Electric Power have acquired a site on the Airedale Housing Estate, upon which they propose to erect an electricity sub-station.——The E.C. has submitted proposals to the B.E. for providing additional class-room accommodation at Love-lane Council School, at an estimated cost of £950.

PRESTONPANS.—A new Miners' Welfare Institute is to be erected between Cockenzie and Prestonpans on a site, the gift of the Edinburgh Colliery Co. The institute will comprise billiard-room, lecture-room, &c., with accommodation for hallkeeper.

REDCAR.—The North Riding E.C. is forwarding plans of a central school at Redcar, estimated to cost £8,200.——Active measures are being taken by the T.C. to meet the housing deficit. Sanction has been secured from the M.H. to erect an additional 50 houses.

ROCHDALE.—A special committee has been appointed by the T.C. to negotiate the purchase of the West Hill Estate, as the site of the new fire station and the erection of 30 houses for the brigade.——The Borough Surveyor has been instructed to invite tenders for the new bridge at Hamer.

ROCK.—Plans passed by R.D.C.: Bungalow, for Mr. F. S. Taylor, at Bliss Gate, and bungalow, at Far Forrest, for Mr. T. H. Pratt.

Read, house, Lansdowne-road; C. W. J. Walton, house, Westland-road; A. Munslow, house, Birches Barn-road; E. A. Ward, 10 houses, Albert-road; Miss N. Newman and C. W. D. Joynson, two houses, Coleman-street; J. Fullwood, dance room, 17, Chapel Ash; F. Myatt, Ltd., outbuildings, "Navigation Inn," Commercial-road.

WOMBWELL (S. YORKS).—Plans have been prepared and tenders are shortly to be invited for the erection of a picture house. Mr. C. Castelow, Park Row, Leeds, is the architect.

WORKINGTON.—The trade unions of Workington have acquired a site in the centre of the town, about one acre in extent, upon which they propose to erect an assembly hall and shops as a war memorial. The estimated cost is about £30,000.

WORKSOP.—The B.G. has decided to build a new mortuary, to be attached to the Kilton Hill Infirmary.

WORTHING.—Plans passed by T.C.: House, Tarring-road, H. M. Potter, for B. Drayton; conversion of St. Edward's Hostel, Clifton-road, into two flats, J. E. Lund, for Rev. E. Hollands; four houses, Evelyn-road, F. G. Abell, for the Worthing Estates Building Co.; house, Brooklyn-avenue, Sheppard & Stephenson, for P. L. Ellercamp; house, St. Wilfred's-road, H. J. Sparks, for C. I. Leech; two houses, Bulkington-avenue, J. E. Lund, for H. A. Webb; house, Gerald-road, Sparks Bros., for F. B. Vigor; house, Chesswood-road, H. M. Potter, for C. W. Collier; conversion of Warwick Lodge, Brighton-road, into a restaurant, T. R. Hyde, for H. Grice; house, St. George's-road, J. E. Lund, for L. Willment; 37 semi-detached houses, fronting Park-avenue and Homefield-road, for E. H. Barton.

FIRES.

BLACKBURN.—Great damage has been done by fire to the warehouse of Messrs. C. A. Critchley & Co., Cardwell-place.

ELTHAM.—Damage estimated at about £10,000 was caused recently by a fire at the mansion known as "The Chaundrye," Court-yard, Eltham, the residence of Mr. H. Pearce. "The Chaundrye" consists of about twenty rooms, several of which date back to the sixteenth century, and is situated close to the famous Prince John's Palace.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach him not later than Tuesday evening.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4284. MARCH 28, 1924.

SLOVENLY LONDON

OF all the virtues tidiness is the least inspiring, and when treated as an end in itself it may well become a substitute for initiative. It is well known that many of our greatest men have been famous for untidy habits, but we must not on this account excuse the complete indifference to the slovenly appearance of our towns, which has now become a national attribute. This kind of slovenliness is not comparable with that of the man of science or the artist who is too much occupied with matters of greater moment to consider his personal appearance, but it is rather a symptom of that apathy and indifference to our surroundings which are involving us in perennial trouble and expense, in dirt, squalor and disease. It is difficult for the architect who notices his surroundings to realise how completely blind the normal Englishman has become. He sees nothing unless by the sheer blatancy of vulgarity some advertiser hits on a new "stunt" that forces the passer-by into a momentary gape. It is this absence of any feeling of civic responsibility that is typified by the dirty unkempt appearance of our streets and temporary open spaces. If we knew that it arose from the absorption of the Londoner's mind in such questions as to whether or not we are improving Regent-street, and whether a bridge should be built at Charing Cross or St. Paul's, we might be less ready to condemn—but then we certainly should not be living in the London of to-day!

The moral effect of tidiness is at the present moment being urged in Dublin, where every effort is being made to clean up the city before the visitors arrive for the National Games and the Horse Show in August; and nothing could be a better witness to the changed times. Some steps should likewise be taken in London. Is the vast influx of Wembley visitors to be confronted with the dead cat, the rusty saucepan, and last year's newspaper, which now feature on our vacant sites? Surely, no vested interest finds financial profit in these three commodities. During a time of widespread unemployment, local authorities might well turn their attention to cleaning up our vacant sites, and in order that we may at least look respectable before our visitors our authorities should regulate the advertiser to the best of their ability, and generally initiate a campaign of cleanliness and order. Strata of peeling paper on dishevelled hoardings cannot even claim to be the "working man's Burlington House," a term which the chairman of a well-known company recently appropriated for a popular line of pictorial posters.

A disgusting London habit is that of placing cylinders of garbage, generally uncovered, along our streets, to be emptied into refuse carts at precisely the hour when business men are setting out for the day's work. A walk along Oxford-street at "garbage time"—especially when there is any wind—is a memorable experience. The rates and the lungs of Londoners would be immensely relieved if householders would adopt the recommendations of the various authorities and burn all their combustible refuse. Arising in one's mind out of the garbage is the butcher's shop and the fishmonger's, where perishable food is exposed for sale in the open at the mercy not only of the refuse-laden wind but of flies and other insects, a perpetual source of wonder to foreigners and a constant contradiction to the reputation we have gained as leaders in sanitation and hygiene.

It is curious that whereas local authorities are always prepared to house themselves in buildings of architectural pretensions (even though sometimes misdirected), yet the same authorities, having paid this tribute to architectural dignity, feel apparently that nothing more need be done; too often they fail to grasp that a palatial municipal building in a sordid setting is not a good advertisement for local administration. Napoleon expressed his desire for superior effect by being the only badly dressed man in a splendid court, and some of our authorities might borrow from his dramatic instinct and look after the amenities of their districts a little more zealously.

The backs of our suburban houses are not beautiful, and no doubt Mondays must be consecrated to the family washing; also that new menace, the wireless aerial, has come to stay. But all such features, posts and supports, together with the tool shed and the rabbit hutch, might be erected with some sense of decorum. As it is, they are shoddy and dirty monstrosities and give a depressed idea of the neighbourhood. Pride of home should be innate in everyone, and although it is obviously straining the expression to expect anybody who lives in the normal monotonous terrace to be exactly proud of his house, still he might mend his tumbledown fence, or expend a little ingenuity in making his own section of the terrace kempt, and as pleasing as little adventitious aids can make it—which is not saying or expecting much.

Just as the domestic grate is mainly responsible for the smoke pollution from which we suffer, so the individual house is the most important unit in town life, and if we are to do any good we must begin with the householder. With a view to enlisting his interest the London Gardens Guild exists to encourage the planting of forecourts, of window boxes, and of pots and tubs in the areas. Not only are competitions started, but the cultivators are advised as to suitable plants and assistance is given in obtaining soil. The hideous area and the grimy sill are always with us, so let us be thankful to those who will teach us how to transform them. The popularity and growth of the movement is proof of public response and, as a practical result in the poorest districts, we now find oases of greenery. In the richer residential districts our city is on the whole well kept, and, however tormenting his covenant may appear to the sufferer, the public generally may thank the landlords for the decorating clauses which apply almost universally to the exteriors of West End houses, and which result in keeping the district comparatively clean. This is not to suggest that stucco surfaces requiring constant repainting in a smoky town are suitable or desirable, but as we have them let us enjoy the enforced gaiety of the spring painting, the revived porticoes and the refreshed railings. Eyewash has its reward, and a district is found to respond to its coat of paint as speedily as a man-of-war. It is not "swank" that keeps the shine on the British Navy; the brass, the decks, and the steel work are symbols of efficiency, and English seamanship owes much of its traditional discipline in emergency to the order and polish of its everyday surroundings.

We will not venture an opinion as to whether democratic tidiness is or is not possible. The fragments that remain after a Bank Holiday on Hampstead Heath, or the breakages bill at an hotel after New Year's Eve, would indicate that it is not; but on the other hand the amazing success of the campaign that has eliminated in England the vile habit of spitting would argue that the public is capable of learning a lesson in decency. At any rate, those in control should remove the reproach that they have never made any serious attempt to inculcate civic pride into the masses.

NOTES.

London Traffic Bill.

The London Traffic Bill which is being introduced by the Minister of Transport this week includes several important proposals to "make further provision for the control and regulation of traffic in and near London and for purposes connected therewith." An important Committee, to be called the London and Home Counties Advisory Committee, is to be appointed to deal with an area consisting of the administrative counties of London, Middlesex, and parts of Berkshire, Bucks, Essex, Hertford, Kent and Surrey. Some of the matters which may be referred to the Committee are the co-ordination of all or any forms of transport service, co-ordination between the persons operating the same in the best interests of the public, causes tending to hinder the free circulation of traffic and measures to be adopted in connection therewith, the desirability of the revision and simplification of existing enactments, the development, improvement, or extension of existing systems of road communication, new transport systems, the fixing of building or street lines, and the cost of road schemes.

Road Works.

All these matters are of vital concern to the people of London and the surrounding area, but proposals of special interest to our readers are made in reference to the carrying out of road works. According to *The Times*, in order that the times for the execution of works of road maintenance and improvement by the various road authorities within the London traffic area may be so arranged as to mitigate as far as possible the congestion of traffic due to the closing of streets for the execution of such works, it will be the duty of every road authority within the area to submit to the Ministry every half-year a statement of the works proposed to be begun which will involve the closing to vehicular traffic of any part of any street. These proposals will be referred to the Advisory Committee, who will report to the Minister thereon. The Minister will then draw up schemes prescribing the times during which the various works are to be commenced, the order in which they are to be executed, and prohibiting or restricting the execution of any such works. The Minister will also send to such other authorities which have power to take up the road copies of the proposal of the road authorities, and it shall not be lawful for any other authority within twelve months of the completion of such works to take up the streets unless they can prove to the satisfaction of the Minister that they could not have been executed at the same time.

Obstructions and Barriers.

It is a curious commentary on our methods of government that it needed a 'bus and tramway strike to secure some such enactments which are long overdue, and which have been advocated so often by town-planners and others. Another claim in the Bill which will be welcome to users of our streets is clause 5, giving power to police officers authorised for the purpose to report to the road authority any case where an obstruction is caused by the deposit of excavated matter, or by the construction of barriers beyond an extent that is reasonably necessary. If the road authority is satisfied that there is ground for the complaint it may order the obstruction to be removed within twenty-four hours subject to a right of appeal to the Ministry.

Tidy Advertising.

"Tidiness" suggests rather the careful housewife than the artist, and yet if we substitute the word "order" there is no incongruity in the association and the significance remains the same. "A place for everything and everything in its place" is a worthy maxim that has suffered little by much usage. We were reminded of it by those workmanlike, framed, automatically changing posters to be seen at some of our railway stations. They are instances of the unoffending in the realm of advertisement, and each, as it pauses to make a fresh appeal, makes an imprint upon the memory that the carelessly pasted sheet, unintelligently repeated upon every available blank space, can never aspire to. One feels that here the advertiser is not tres passing and that he gains much in his observance of the decencies. We would be the well-wishing mentors of the adver tiser, whose interests are very much the same as ours, and in this reading of the pulse of public needs there appears to be a vast saving of money at the same time as an improved state of order in our public places.

Area Gardens.

We are glad to note the excellent little article in the current issue of *St. Martin' Review* by the Rev. Roll Meyer, on the London Gardens' Guild There is no need to stress the charm o these brave attempts in areas and boxe to bring back nature where she has bee banished for so long. The results do no disguise dinginess, they transform it and, unlike the same trouble and tast expended inside the home, the pleasur here is spread generously for the passer-b

The New R.I.B.A. Meeting Room : The Entrance Hall. (*See p.* 486.)

Sculpture by Kai Nielsen.

o share. It is probable that most big novements surprise us more by the simlicity of their origin than by the comlexity; their success is their justification, nd by that the London Gardens' Guild is bundantly justified. In Southwark alone here are 3,289 cultivated forecourts. o class in the community can be so much enefited professionally by house and arden pride as the architect, and we hould like to see this movement recogised and encouraged by the bodies which t so much concerns. We join with the riter in the *Review* and congratulate the nnamed originator of the movement on is appointment to a seat in the new abinet.

The "Parliamentary Visitor."

It may appear reactionary, but there are many artists who would prefer the uncertainty of a benevolent utocrat in patronage to the democratic lternative of a committee, or of an official xecuting a public order. The artist is ware that many of the finest works of art n Europe—or, indeed, in the world—were lirectly commissioned as the sport of Kings, nd we in England are further aware that lemocracy introduced herself here allied o a destructive Puritanism. The diary f William Dowsing, "Parliamentary isitor . . . for demolishing the superitious pictures and ornaments of hurches, &c. . . . 1643–1644," extracts f which have been given to us ecently by Mr. Arthur Ponsonby in his elightful anthology of diaries, is in itself n awful warning. "*Clare*: We brake own 1,000 Pictures superstitious; I rake down 200; 3 of God the Father nd 3 of Christ and the Holy Lamb, and of the Holy Ghost like (*sic*) a Dove with ings; and the 12 Apostles were carved n Wood on the top of the Roof which we ave order to take down; and 20 herubims to be taken down; and the un and Moon in the East Windows, by the King's Arms, to be taken down." The fee extracted for these congenial services was, we are told, 6s. 8d., not always paid up. We recommend this entry to the study of our Commissioners of Fine Arts.

The National Gallery.

The centenary of the National Gallery, which occurs this year, reminds us of the extraordinary developments which have taken place since its modest beginning in 1824, when the British Government made under some pressure a grant of £57,000 to start the first public art collection which the nation had ever possessed. From these small beginnings it has reached to its present rich and representative character. At such a time it is well to consider the importance of retaining for the collection the highest prestige, so that, in the words of a contemporary, it continues to "set the highest possible standard and correct the passing influences and fashions of the moment." This is well said, though difficult to sustain. We have noticed a tendency in recent times to depart somewhat from this standard and have seen examples of more than questionable merit finding place in the galleries. England is poorer to-day and the opportunities for purchase will consequently be restricted, but care should be taken that passing fashion, contemporary reputation, and the pressure of groups and schools, all such fallible things, should not influence the decision of the directors. Traditional values and the precedents that belong to the exercise of a wise choice should direct us to be slow in appraising as of permanent importance many of the phases of art which exercise so much influence now. On the other hand, the "old master" needs approaching with an equal caution, lest the prestige of great names lead us to false estimations of value, as in the case of the £70,000 Raphael acquired some years ago. Artificial values created for commercial ends have most often slender relation to the intrinsic values of pictures.

"After the Matriculation."
Decorative Panel for Great Hall, by Professor Axel Iörgensen.

GENERAL NEWS

Professional Announcement.

Mr. Millen, of Messrs. Ernest G. Allen & Partners, has resigned his membership in this firm, and in future the business will be carried on by the remaining partners under the style of Ernest G. Allen & Alfred R. Potter.

The Royal Archæological Institute.

The summer meeting will be held this year at Winchester from July 16 to 23. A preliminary programme will be sent to all members in May.

Easter Tour.

An Easter tour has been arranged by the Garden Cities and Town Planning Association to the Dordogne. The party will leave London on April 16 and return in the week-end April 26–28. Full details of the tour, itinerary, cost, &c., will be sent on application to the Secretary, Garden Cities and Town Planning Association, 3, Gray's Inn-place, London, E.C.1.

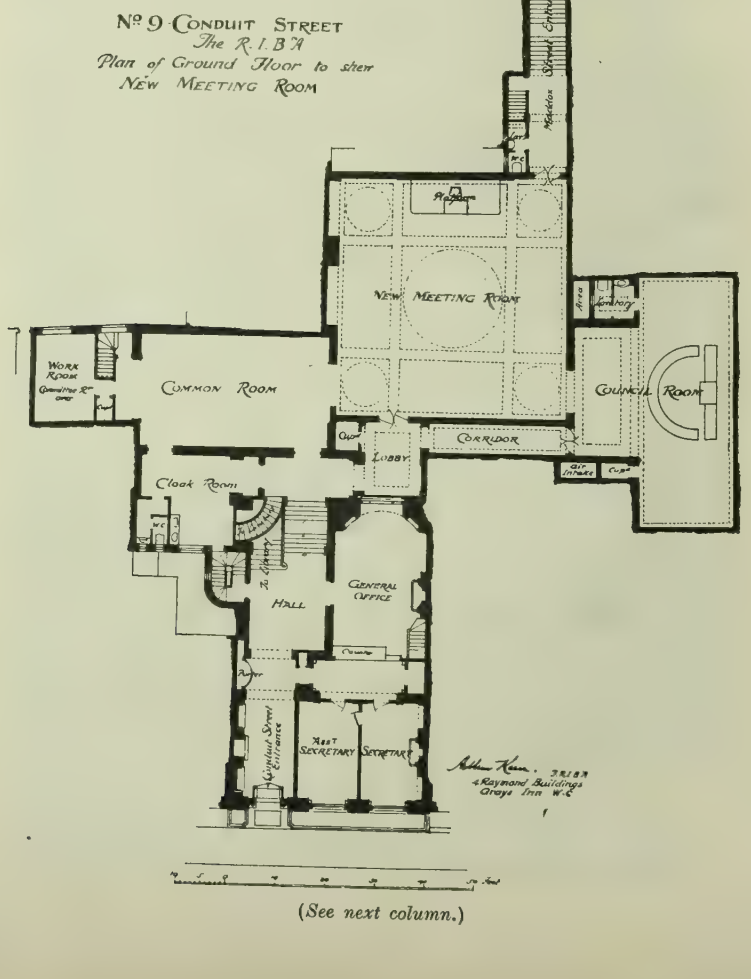
Green Lights.

Tests were recently carried out under the supervision of H.M. Office of Works with a new traffic beacon. It gives out an intermittent flashing green light, and an experimental beacon will shortly be erected in the Mall. It is manufactured by the Gas Accumulator Company (Limited).

Romney Marsh Sea Wall.

The authorities of Romney Marsh have given instructions for the preparation of a scheme for the repair and strengthening of the sea wall, considerable damage having been done to the sea defence work during the past winter. It is estimated that the total cost of the work of repair will reach £20,000, but it will probably be carried out in sections in order to lighten the cost upon the taxpayers of the Marsh.

Ayr Memorial.



The Ayr War Memorial will be unveiled on April 13 by Air-Marshal Sir Hugh M. Trenchard, G.C.B., D.S.O., honorary colonel of the Royal Scots Fusiliers. The memorial, which was designed by Mr. J. K. Hunter, F.R.I.B.A., Ayr, occupies a site in Wellington-square, and is in the form of an obelisk in Creetown silver-grey granite. It is placed on a granite platform, 25 ft. square, with broad flights of shallow steps, and rises to a height of 27 ft. 6 in. On each of the four sides of the die there are bronze panels. The main panel, facing south, carries the dedicatory inscription, and the remainder of the space of this panel and the other three panels bear the names of the fallen to the number of about 840. The cost of the monument is estimated at £2,000.

Peabody Buildings.

The latest report of the Peabody Donation Fund shows that, at the end of 1923, the Governors had provided for the artisan and labouring poor of London, 16,034 rooms, 6,652 separate dwellings, 299 cottages of five rooms, four tenements of six rooms, 21 tenements of five rooms, 296 tenements of four rooms, 2,196 of three rooms, 2,735 of two rooms, 1,091 of one room, and nine shops with 61 rooms attached. The total amount of the Peabody Donation Fund at the end of 1923 was £2,241,190.

Design for Piccadilly Circus.

The design "Suggestion for the Remodelling of Piccadilly Circus," by Mr. W. Harding Thompson and Mr. P. D. Hepworth, published in *The Builder* of February 15, was specially prepared by them for the February number of *Architecture*, and we should have mentioned the fact had we known it before.

(*See next column.*)

COMPETITION NEW

Heswall Golf Club, Cheshire.

We are informed that the winner of th competition is Mr. Herbert J. Rowse, A.R.I.B.A 9, Cook-street, Liverpool.

Nurses' Home : Kingston-on-Thames.

The President of the Royal Institute of Briti Architects has nominated Mr. Alan E. Munb F.R.I.B.A., as assessor in this competition.

Barton-on-Irwell.

The sending-in day for this competition June 28.

New Masonic Temple.

The Bradford Masonic Association invi designs and estimates for a Masonic Templ to be erected at Bradford. Premiums of £20 £150, and £100 will be awarded to the firs second and third premiated designs. A com mittee appointed by the Association will a as assessors. Sending-in day, June 30. Pla and conditions can be *seen* at the office *The Builder*, but cannot be taken away.

Masonic Peace Memorial.

For full particulars of this competitio see our issue for February 8. No sending-i date has yet been fixed.

Other Competitions.

Other competitions still open include th following (the dates given are, first the sendin in date, and second the issue of *The Builder* i which full particulars were given) :—Industria Designs (June; Dec. 21, 1923). Nationa Theatre (April 26). Monument to Sir Wilfri Laurier (April 3; Dec. 14, 1923). Ross-Smit Memorial (Sept. 30; Feb. 1).

THE NEW R.I.B.A. MEETING ROOM

The reconstruction of the meeting room o the Royal Institute of British Architects a Conduit-street, which was contemplated son two years ago, when a piece of land adjoining th old room was purchased, is now complete an the new room is in use. It is about 47 ft. squar lighted by a central glass dome and by fou small domes in the corners. The approach through a new vestibule at the side of the do into the Common Room, and from this vestibu a corridor leads to the old East Gallery, enlarg by throwing into it a portion of the old meetin room, which is now to serve for the Coun room. The only other alteration has been increase in the lavatory accommodation. M Hope Bagenal was consulted as to the treatme of the meeting room in order to make it a go one to speak in, and the general impression that the results is distinctly satisfactory. the room will be used frequently for exhibitio the walls had to be finished with boarding a canvas, but on the side opposite the platfor the wall is padded with "Cabot" quiltin and the frieze round the room, except ov the platform, is similarly padded, as are t upright fillings under the central dome. T wall behind the platform is panelled in woo so as to form a good reflector of sound.

The heating and ventilating arrangemen have been reconstructed by Messrs. J. Jeffre & Co., Ltd. The electrical work has been do by Messrs. Locke & Soares. The quilting of t walls has been carried out by the May Co struction Company, and the contractors for t general building work were Messrs. Jo Greenwood, Ltd. The roof lights and lante were made by the British Challenge Glazing C The details of the reinforced concrete gird for the roof and elsewhere were made by J Oscar Faber. The Hon. Secretary, Mr. Arth Keen, has acted as architect.

THE CULTURED LAYMAN ON ARCHITECTURE

By WILLIAM DAVIDSON.

Lord Curzon's speech at the opening of the second exhibition of the Architecture Club at Grosvenor House is of great value to the architect for several reasons; but chiefly as it gives the opinions of a cultured layman and one whom architects naturally and rightly consider the ideal type of client.

We have seen his restoration of Tattershall Castle, carried out under the able direction of Mr. William Weir, which shows his soundness in dealing with certain aspects of architectural problems, but in his speech at the Architecture Club he made certain statements which were rather misleading, and which show that even culture, education, and every social and international advantage do not endow the individual with a complete understanding of the architect's point of view or the reasons underlying the success or failure of the work of all generations. For a man of Lord Curzon's wide culture and extensive travel it is rather surprising to find that his study of history has not taught him that architecture can never be ahead of the highest religious, social and intellectual condition of its own generation. Architecture has developed (whether up or down), always developed, since the earliest and crudest form of shelter, varying in each country according to religion, social habits, climatic conditions; and is subject to temperamental considerations and spiritual and intellectual ideals. It has followed the rise and fall of civilisations and will ever do so. This being so, why blame the architect? Blame rather a misguided civilisation.

Lord Curzon's reasons for desiring to be a working architect are excellent. We are well aware that "it needs and demands no small amount of study and research; and, above all, there is scope for creative power and human imagination." Thus far we agree with him; but it is oftener "the horse box" than "the cathedral" and "the cowshed" than "the castle" which the architect of to-day is called upon to design. We wish we could agree with him when he says that the architect who puts up a bad building is damned (in this world we mean). Architecture would progress by leaps and bounds if it were so. We have all met the cultured, university-trained client who prefers the pretentious vulgarity of the mid-Victorian mansion; flamboyant and rococo to the last degree; to the simple, dignified harmonious habitation, finely composed and carried out by some scholarly artist. Taste and culture alone do not always, unfortunately, give the power to appreciate the subtleties and refinements of good work. That being so, the architect who does bad work will always find clients, if he has a personality charming and impressive enough to pass for great erudition. The interest of the public in architecture has certainly increased very greatly within the last 30 or 40 years since the new movements in architectural education were inaugurated, and the great improvement in our architectural magazines took place. Every new student, also, in architecture, proves a new centre and brings his relatives and friends within the scope of its magic and refining circle. Lord Curzon asks if we are capable of producing any new style? Does any qualified architect think it advisable to produce a new style or does he desire to do so? Any new style would be purely artificial unless it originated in some entirely new need or in some new system of civilisation. We are writing, to-day, the history of our own time as surely and truly, in stone and lime, or duo-slab and papier-mâché, as any former age has ever written its history. The civilisation of ancient Greece is stamped on its architectural remains; the social life of Pompeii is everywhere in evidence among its ruins; and the religious fervour and sincerity of the Middle Ages is stamped on every part of its great cathedrals, abbeys and parish churches. Architects of all ages have ever been at the mercy of their clients and never more so than to-day. Phidias, Brunelleschi, Michelangelo, Bramante, San Machaele, Wren, and Adam, to mention only a few, did not invent new styles, and yet they were not mere eclectics. They simply adventured along the lines of natural evolution within the bounds of their structural limitations and utilitarian needs. What less are the best of us doing to-day?

Will posterity not recognise the soundness of the views of such prophets, in the educational world, as Pite, Lethaby, Baldwin Brown, and Anderson; or in the practical world, such workers as Shaw, Bentley, Lutyens, Rickards, Burnet, and Lorimer, to mention a few outstanding men of our own time? Men who, in spite of a multitude of adverse conditions, have expressed the highest and best of their own age. Conditions of a complexity which no former age has ever been called upon to face.

A Reinforced-Concrete Shop Front at Barcelona.

Lord Curzon's remark that the people with money are to-day mostly deficient in taste is only too true, and really strikes at the root of the whole matter. The old aristocracy produced our finest clients. To work for such is indeed a pleasure. The new aristocracy neither know what they want nor will they take the advice of qualified men. There are three reasons why architecture in this country or, in fact, in any country which fought in the Great War is likely to lie under a shadow for a generation or two. First, many of our best men were either killed or died as the result of war service. Second, many more of our ablest men have entered the Civil Service, where they have ceased to be creators. Third, money can only be found for a few of those who remain in private practice to enable them to show what they are capable of producing. Never has the training of the architect received greater attention, but the Church has withdrawn her patronage and the stock exchange and the world of commerce now hold the bank. Speaking of small houses, Lord Curzon is hardly just to the architect of to-day. No country in the world has produced a finer modern domestic architecture than Britain, and it is not entirely due to the hand of one man. We agree with him regarding the beauty of the old Tudor, Elizabethan, Jacobean, and Renaissance domestic work of old England, but here again, in making comparisons, one must consider the relative conditions under which each was produced; the conditions of past ages with those of to-day. Anyone who has measured, sketched and studied, say, the fine old Tudor brickwork of East Anglia or the earlier Renaissance work in Northamptonshire, must agree that their beauty is not a beauty of fine detail, but the beauty of a living tradition; a fitness in all things; setting, environment, local material, traditional standardisation, grouping, composition, and a natural expression of the simple requirements of a simple and apparently contented age. It seems impossible that the mouldings, carving and enrichments of these times were ever designed on paper. The hewer and carver was the designer. His hand transferred his idea direct from the brain to the stone. He only did a little better than his father did before him. Hence the living tradition. As detail, in the architectural sense, it is mostly crude, but the manner of its creation has endowed it with life. And what of the manner of to-day? The detail is sketched out roughly by the master, corrected by an assistant, traced by the youngest pupil, handed to the clerk of works, who hands it to the foreman, who hands it to the hewer. The hewer copies it as faithfully and mechanically as his ability and conscience will permit, flattening out the contours if he thinks he can escape detection. The final result is a clean cut, cast iron, inaccurate reproduction of the designer's intention. Does anyone think that the spandrils in the north porch of Wells Cathedral, or the nave caps at West Walton were done in this way? I think not. No great architecture can be achieved without great craftsmen. Trade unions are too afraid that their members burst a blood vessel to allow them to put their heart and soul into the work of to-day.

Lord Curzon asks for a George and Mary style. He here, surely, reaches the lowest point in appreciating the architect's point of view. A George and Mary style does exist if only we had the eyes to see it. Posterity will see it and classify it. How can it be otherwise? Are we not writing the history of our own time as surely as the Romans did? It may be a miserable history, but it is nevertheless true. Clever firsts in competitions create groups of stylists. These are ultimately swallowed up in the greater whole, advancing or declining as national universal thought advances or declines. Every decade

of our generation will be as clearly discernible and classifiable to the archæologists of future centuries as the periods of Mediæval Gothic are to-day.

In Gothic times, if we compare the work on the coast of East Anglia with the work of, say, St. David's, it seems to have taken about 40 years for a style to cross England. To-day a brilliant first in a competition is flashed from Land's End to Orkney in a week by the aid of our weekly architectural journals. How can two such totally different sets of conditions produce equally good results? Until we have adjusted ourselves to our new conditions our work must always suffer.

We cannot agree with Lord Curzon when he says that a good country house will never be built again. In three generations the descendants of the nouveau riche will be either gentlemen or paupers. (We all came originally from a primitive people.) Architects are ready and willing to turn their hands to the designing of cottages if the heavy hand of the Government and the speculative builder could be removed.

What did Lord Curzon really mean when he said "use an English style in England"? Did any qualified architect ever do, or wish to do, otherwise? Is the difference between, say, French and English Gothic, or Italian and English Renaissance, so clear that the average layman could distinguish the difference? Did any trained architect of any age ever build a French chateau overlooking an English landscape unless some ill-bred, pretentious client demanded it? Surely the evidence of training and qualifications eminently essential for practising the art of architecture are rooted in the perception of fitness and reason in all things. No really great architect was ever "aggressively individualistic." Bernini missed true greatness for this reason. Does any really unprejudiced individual consider that architecture has made no advance since the late Victorian era?

New materials, new methods of construction, new business requirements, will ever naturally lead to new forms of mass and new details in design, but such new forms must be organic and not the deliberate attempt to create new styles. The solution of the problem lies neither in the creation of a new style nor the education of the architect, but the arrival of a new and better type of client. A client who realises the great and noble legacy of many past generations; his responsibilities to posterity, and the artistic reputation of his own country amongst the nations of the world.

For the architect the best advice of all is that given by Prof. Richardson at Cambridge the other day, viz., "the realisation of new truths out of the observation of principles which are eternal" or, as Prof. Lethaby said in a recent letter to the writer, "We need the idea of living, advancing, sufficient structure." Architects to-day are hampered by ignorant clients and by our unbalanced economic and commercial conditions.

Exhibition of Cairo Hospital Competition Drawings.

The drawings submitted by the following competitors in the Qasr-el-Aim Hospital, Cairo, competition will be exhibited in the R.I.B.A. Gallery from Monday, April 7, to Thursday, April 17:—Messrs. H. Percy Adams and Charles Holden; Messrs. Henry V. Ashley and F. Winton Newman; Messrs. J. T. Cackett and R. Burns Dick; Mr. E. Vincent Harris; Messrs. H. V. Lanchester, T. Geoffrey Lucas and T. A. Lodge; Messrs. William and T. R. Milburn; Messrs. Charles Nicholas and J. E. Dixon-Spain (photographs only); Messrs. William A. Pite Son & Fairweather; Mr. J. Reginald Truelove The exhibition will be open daily between the hours of 10 a.m. and 6 p.m. (Saturday, 12th, and Thursday, 17th, 1 p.m.).

CORRESPONDENCE

The Late W. H. Ward.

Sir,—May I add a few reminiscences to Mr. Richardson's sympathetic appreciation of W. H. Ward, whose friendship I enjoyed since the day when he first came to Repton in the autumn of 1881? As a schoolboy he did not make many friends, his rather foreign ways (for his mother came of an old Genevese family) making him suspect to the British boy. But the friends he did make loved him as a brother. From the first he showed signs of great mental ability, and the present headmaster of Harrow (Dr. Ford) once acknowledged that he was the only boy he ever feared in competition. I do not think he ever loved school life; but from the day he entered Clare he became the most devoted of the sons of Cambridge, plunging into the many pools of academic life with never-failing enjoyment. He was one of a group of Cambridge men of brilliant promise (though more than one, alas! died too young)—F. E. Garrett, President of the Union, and Editor of the *Cape Times* during the breathless years which preceded the Boer War; J. C. Iles, one of the four Senior Wranglers of 1887, and H.M. Inspector of Schools; W. G. Clay, barrister-at-law, who was killed in an Alpine accident before he could reach the high honours to which his friends believed him to be destined; J. N. Figgis, brilliant historian and theologian; and the present Lord Almoner's Professor of Arabic and the Norrisean Professor of Divinity. I do not remember the impromptu verse to which reference has been made but his translations from French, German, and Italian poets were eagerly welcomed by his friends, and some of them published in a small book of verse such as undergraduates love to perpetrate. He would almost certainly have taken First in the Classical Tripos if he had not been trammelled by the stupid mathematical requirements of the "Littlego," which in those days held back many a promising Classic student from his proper studies. Ward had always been a good draughtsman; but it was only after a period of schoolmastering at Liverpool College that he determined to devote himself to art. If I remember right, Sir A. Blomfield was very discouraging at his first interview; but after seeing his drawings completely altered his tone. How completely Ward was justified in changing his profession every architect bears testimony. In every profession there are those rare souls whose work commends itself more to his colleagues than to the indiscriminating public. And if there are "poets' poets," and "doctors' doctors," Ward was by all accounts an "architects' architect." But for myself I remember him as a lifelong friend. *Ave, Frater, atque Vale!*

H. L. Ogle.

Modern Architecture.

Sir,—Your comment in the last issue of *The Builder* that such a result as a new national style of architecture will not be achieved in any conscious way, cannot be unduly emphasised. If, as designers, architects endeavoured to express the purpose of building as directly and simply as possible, relying more upon the truth of a building's construction for ultimate effect, and uncompromisingly rejecting meretricious detail, would there not ultimately ensue a harmony, a dignity, and an orderliness in all architecture which would reflect more truly the national character, and though silent in operation, be amongst the most potent of beneficial influences in the lives of city and urban dwellers?

F. Ernest Crutchley.

Hornsey.

Architectural Competitions.

Sir,—With reference to the correspondence in *The Builder* on the subject of the eternal competition question, it has occurred to me that something might be done in the matter of remuneration to each of the unsuccessful competitors.

There is always a tremendous expenditure of energy and talent and of time by each competitor in every competition; and, however good, bad or indifferent those designs may be it is obviously impossible for all to be successful.

Under these conditions would it not be fair to everyone if each *bona-fide* competitor were to receive an honorarium, say, of two or three guineas, for the trouble and labour involved in preparing the drawings. It would, at least, ohow that the promoters appreciated the efforts sf the competitors. Elfric H. Smith.

Future Building.

A letter on "The Principles of Future Building," by Mr. William Davidson, together with a reply by Professor A. E. Richardson, are given on p. 504.

MEETINGS.

Friday, *March* 28.

Chadwick Public Lectures.—Mr. J. T. Quinton on "The Sanitary Inspector in the Machinery of the Public Health Service." At Old County Hall, Charing Cross, W.C.2. 8 p.m.

Saturday, *March* 29.

Architects' and Surveyors' Assistants' Professional Union.—Visit to Messrs. Liberty's new premises, Argyle-place, W.1. Meet at premises at 2 p.m.

Monday, *March* 31.

Royal Institute of British Architects.—Mr. H. S. Goodhart-Rendel on "English Gothic Architecture in the Nineteenth Century." At 9, Conduit-street, W.1. 8 p.m.

Edinburgh Architectural Association.—Annual General Meeting of the Associates' Section. At 15, Rutland-square.

Wednesday, *April* 2.

Architecture Club.—Sixth Dinner. At Grosvenor House, Upper Grosvenor-street, W.1. 7 p.m.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Byzantine Architecture." At Southampton-row, W.C.1. 6 p.m.

Institution of Heating and Ventilating Engineers.—Mr. S. J. Benham on "Lay-out of Kitchens in this Country and America." At Engineers' Club, Coventry-street, W.1. 7 p.m.

Thursday, *April* 3.

Incorporated Institute of British Decorators.—Annual General Meeting. At Painters' Hall, E.C.4. 3 p.m.

Town-Planning Conference and Exhibition.

The programme of the Town-Planning Conference and Exhibition, to be opened at University College, Gower-street, W., on March 31, at 5 p.m., by H.R.H. Prince Arthur of Connaught, K.G., K.T., G.C.M.G., G.C.V.O., C.B., is as follows:—Tuesday, April 1, 5.30–7.30 p.m.: Dr. Raymond Unwin, F.R.I.B.A., will open a discussion on "Zoning Requirements of Town-Planning Schemes under the Act"; chairman, Mr. Alfred Gotch, President of the Royal Institute of British Architects. Wednesday, April 2, 5.30–7.30 p.m.: Mr. G. I. Pepler will open a discussion on "Technical Requirements in the Preparation of Schemes"; chairman, Mr. Thomas H. Mawson, President of the Town-Planning Institute. Thursday, April 3, 5.30–7.30 p.m.: Dr. I. G. Gibbon, C.B.E., will open a discussion on "Town-Planning Schemes in their Relation to Regional Development"; chairman, The Rt. Hon. Neville Chamberlain, M.P. Friday, April 4, 5.30–7.30 p.m.: Mr. George Topham Forrest, F.R.S.E., F.R.I.B.A., F.G.S., Architect to the London County Council, will deliver an address on "Architectural Interests involved in the Making of Town-Planning Schemes"; chairman, Mr. Andrew T. Taylor, J.P. F.R.I.B.A., F.S.A., former Vice-Chairman of the London County Council.

The Exhibition will open as follows:—March 31, 5 p.m.–8 p.m.; April 1 to April 4, 10 a.m. to 8 p.m.; April 5, 10 a.m. to 5 p.m. Admission will be without fee or ticket.

ENGLISH HOMES*

Mr. Avray Tipping's latest volume fully sustains the character of former publications in the fine series of books descriptive and illustrative of English homes in past times. In dealing with the Early Tudor period, 1485-1558, he is able to include such well-known and much admired mansions as Compton Wynyates, Warwickshire; Layer Marney, Essex; the great Abbeys of Lacock, in Wiltshire, and Wenlock, in Shropshire, beside many other houses of surpassing interest. Some of these buildings have been described before, but the collection of many examples of art of one period, differing from one another in material, in design, and in the details of their execution, makes possible a comprehensive survey of building craft at the time of the Early Renaissance in England.

Details of construction are shown in some few instances, but the appeal of the book, as of others of the series, is to those who wish to study finished effects and the contribution of the relative parts to the whole. The illustrations normally include distant views, exterior details, and interior details of each house shown in a series of splendid photographs. Detail drawings and small block plans are also given in some cases, but the camera has been relied upon in general with consistently good results. Picturesque grouping of masses and attention to tone and colour values characterise the building work of the period, and these important elements of architecture are often better suggested by photography than by the use of architectural diagrams.

The peculiar charm of bricks of rough surface texture and slightly irregular edge bordered by wide creamy white mortar is referred to in the text, and this combination of texture and colour does indeed lend extraordinary interest to the actual buildings; it cannot, however, be portrayed in any satisfactory fashion except by photography.

Great skill and patience must have been expended, too, on obtaining clear views of carving and detail in dark interiors filled with furniture and colour decoration, in spite of reflections from windows and picture glasses. Although the illustrations, perhaps, occupy the greater space, the letterpress is no mere padding, but is arranged as a series of separate articles upon the several great English homes and the affairs of some of their original builders and occupiers.

In the conditions existing in England under Henry VIII, when possessions were changing hands with something like oriental suddenness, many notable buildings were erected in what may be described as a workmanlike style. The technique of the artificer was allowed greater scope than, perhaps, had been the case at any former period. Carving and colour decoration, showing originality and imagination and a love of richness rather than delicacy or precision, are to be seen in almost every example. The old religious restraints were relaxed, the vaulting system of construction had passed away, and with it the necessity of thoughtful consistency of thrust and abutment. The formality of the more mature Renaissance was as yet unknown in England. The master craftsmen engaged to build great mansions for the newly rich inclined somewhat towards exuberance, towards quantity rather than refinement, and above all towards speed of production.

The executed work bears evidence of the qualities as well as the defects of the guild system, of direct contact between the building owner and the craftsmen without the intervention of paper designs for every detail. The quaint grotesques vigorously if crudely carved on a beam at the Marquess of Granby Inn, Colchester, certainly have an unpremeditated spontaneity that savours of the chisel rather than the pencil. No two adjoining turns of the scrollwork contain similar leaves or beasts, and while the bracket under one end of the beam is decorated with one squatting figure, two upright figures are carved upon the other. This free trade in design has its fascination for many persons to whom more severely stylistic architecture is repellent, and if the most finished art is beyond the reach of these spontaneous efforts the sense of easy achievement preserves them from the weight of criticism that visits the failure of more pretentious and ambitious work.

The tendency of art and architecture towards worldliness and fun only reflected the spirit of the time, which had infected even the religious establishments, and gave to Henry VIII some colour of excuse for his scheme for their suppression. As Henry VIII is sometimes accused of acting without due reason, under the spur of greed and selfish interests, readers of Mr. Avray Tipping's book will be interested in the quotations from contemporary writers upon the subject of scandals in the unreformed Church.

The mixtures of style found in so many of the historical mansions under review gives occasion for the introduction of matter dealing with both earlier and later periods than that marked upon the title page, and a very amusing account of the introduction of new building in the "Gothick" style appears in connection with the hall, staircase and gateway of Lacock Abbey. The illustration (405) of the interior of the hall sufficiently indicates the dangers of revivals, the effect being insipid in the extreme. The description of St. Osyth's Priory, Essex, on the other hand, contains mention of a genuine vaulted chamber of the first quarter of the thirteenth century. An illustration (298) shows the extraordinarily slender supports of the stone roof as well as the beauty of the simple cross-groin ribbed vaulting.

All readers may not agree in approving one passage in the book where the author contrasts the excellent work done by Sir Aston Webb and Sir William St. John Hope in conserving the ruins of Cowdray House, Sussex, with the methods employed by H.M. Office of Works in dealing with monuments in the charge of their Historic Buildings Branch. The comparison the author makes is unfortunate, for H.M. Office of Works certainly does not treat the ruined buildings according to "a few official rules," but investigates each problem afresh upon its merits. Unlike most of the other countries of Europe where Government interference too often spells complete restoration, England happens to be served in this respect by a Government Department capable of dealing sympathetically with ancient monuments, which are, in many cases, handed over voluntarily to its care. As to the "grim greyness" of Tintern Abbey, anyone who takes the trouble to investigate the walls already treated by H.M. Office of Works will see that lichens are already creeping back upon their surfaces and will soon mellow them again. Those who have stayed any length of time in the neighbourhood of Tintern and have tried to sketch the Abbey will know by experience that—probably owing to the peculiar lighting effects in the Wye Valley—Tintern Abbey never looks the same colour for two days together. It should be remembered also that the structural problems at Tintern Abbey are so exceptionally difficult that the demolition of large portions had already been sanctioned and actually commenced in the interests of public safety before the building was placed in the hands of H.M. Office of Works and the demolition put a stop to forthwith.

* *English Homes.* Period II. Vol. I. Early Tudor, 1485-1558. By H. Avray Tipping, M.A., F.S.A. (London: Published at Tavistock-street, Covent Garden, W.C. 2; and by George Newnes, Ltd., Southampton-street, W.C. 2. New York: Charles Scribner's Sons.) 1924. Price £3 3s. net.

Chippendale at South Kensington Museum.

A loan collection of Chippendale furniture, with contemporary silver and glass, and needlework and Spitalfields silks, will be on exhibition at South Kensington Museum until April 3.

New Residential College, Copenhagen: Main Entrance. (*See p.* 490.)

NEW RESIDENTIAL COLLEGE, COPENHAGEN

By GEORG BRÖCHNER.

From whatever angle it is viewed the new residential college in Copenhagen, the Studentergaarden, as is its official Danish name, possesses peculiar and interesting features. Architecturally it has further enhanced the fame of its designer Professor Martin Borch.

Although a scheme had been more or less vaguely mooted, it was left for the world-famed surgeon, Professor Thorkild Rovsing, as Rector Magnificus of the Copenhagen University, to endow it with a definite plan and to see that this plan was realised. He proposed that one hundred men should each defray the cost of an apartment to bear his name or a name he suggested. The donation was fixed at 15,000 kr. (about £825) each, the King, himself an old student and at times present at the students' functions, heading the list, Professor Rovsing and three other Professors being the next contributors. Others promptly followed, both private individuals and public funds and institutions, and the plan was extended from 100 to 110 resident students. A number of men, famous in different walks of science, in the Church, in politics, etc., of the past and the present, have had their names perpetuated in this dignified and appreciative manner. The names are found on a stone slab above the respective entrance doors, and the fitness of things has been subtly observed in the connection between the donors and their nominees.

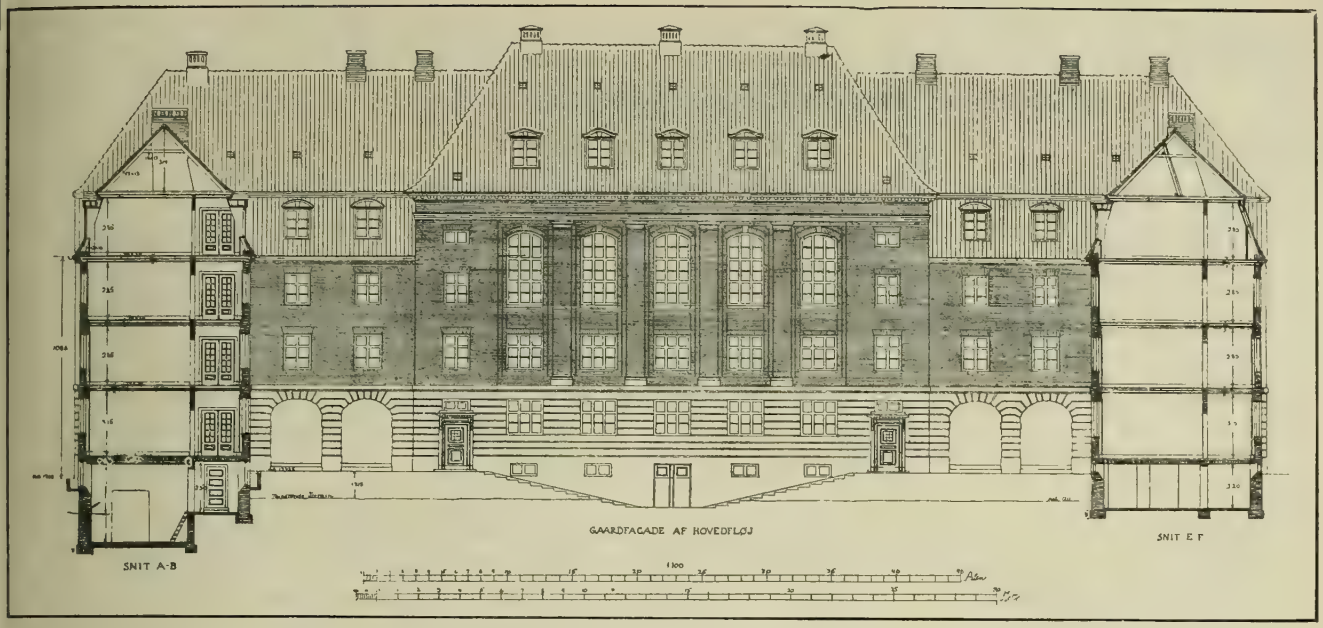
The Corporation of Copenhagen presented a well-situated site of about 40,000 sq. ft., and the main building is a three-winged, massive edifice, in red brick, a material thoroughly Danish and now again much in vogue. This imposing block contains accommodation for 110 students and the "Efor" or Rector, whilst the lower gate house is intended for the Vice-Efor, etc. The courtyard between the gate house and the main building will have its chestnut tree, as the old students' college (the Regensen), built 300 years ago by that master-builder, King Christian IV, has the historic lime tree in the midst of its courtyard. Public funds and private individuals have contributed handsomely to the artistic adornment of the Studentergaarden. Professor Axel Iörgensen, the painter, is engaged upon the composition of a number of scenes in the life of Danish students, and Kai Nielsen, the eminent sculptor, has undertaken the sculptural decorative work, both in the matter of larger compositions and of busts of several famous Professors, conspicuous amongst which are the characteristic head of Professor Höffding and the portrait of Professor Rovsing. The grand hall, when completed, will be exceedingly rich in artistic decoration of great merit, and there are a number of other attractive features, loggia and pergola, and a kind of belvedere pavilion, commodious reading room, music room, etc. For a self-contained residence in this home of good things, and many attractions, each student, *alumners* they are called, pays the modest annual sum of 300 kr. (£16 10s.), the rest of the upkeep being defrayed from a State subsidy and the interest on the residue of the capital, after the buildings have been completely paid for.

EXHIBITION NOTES

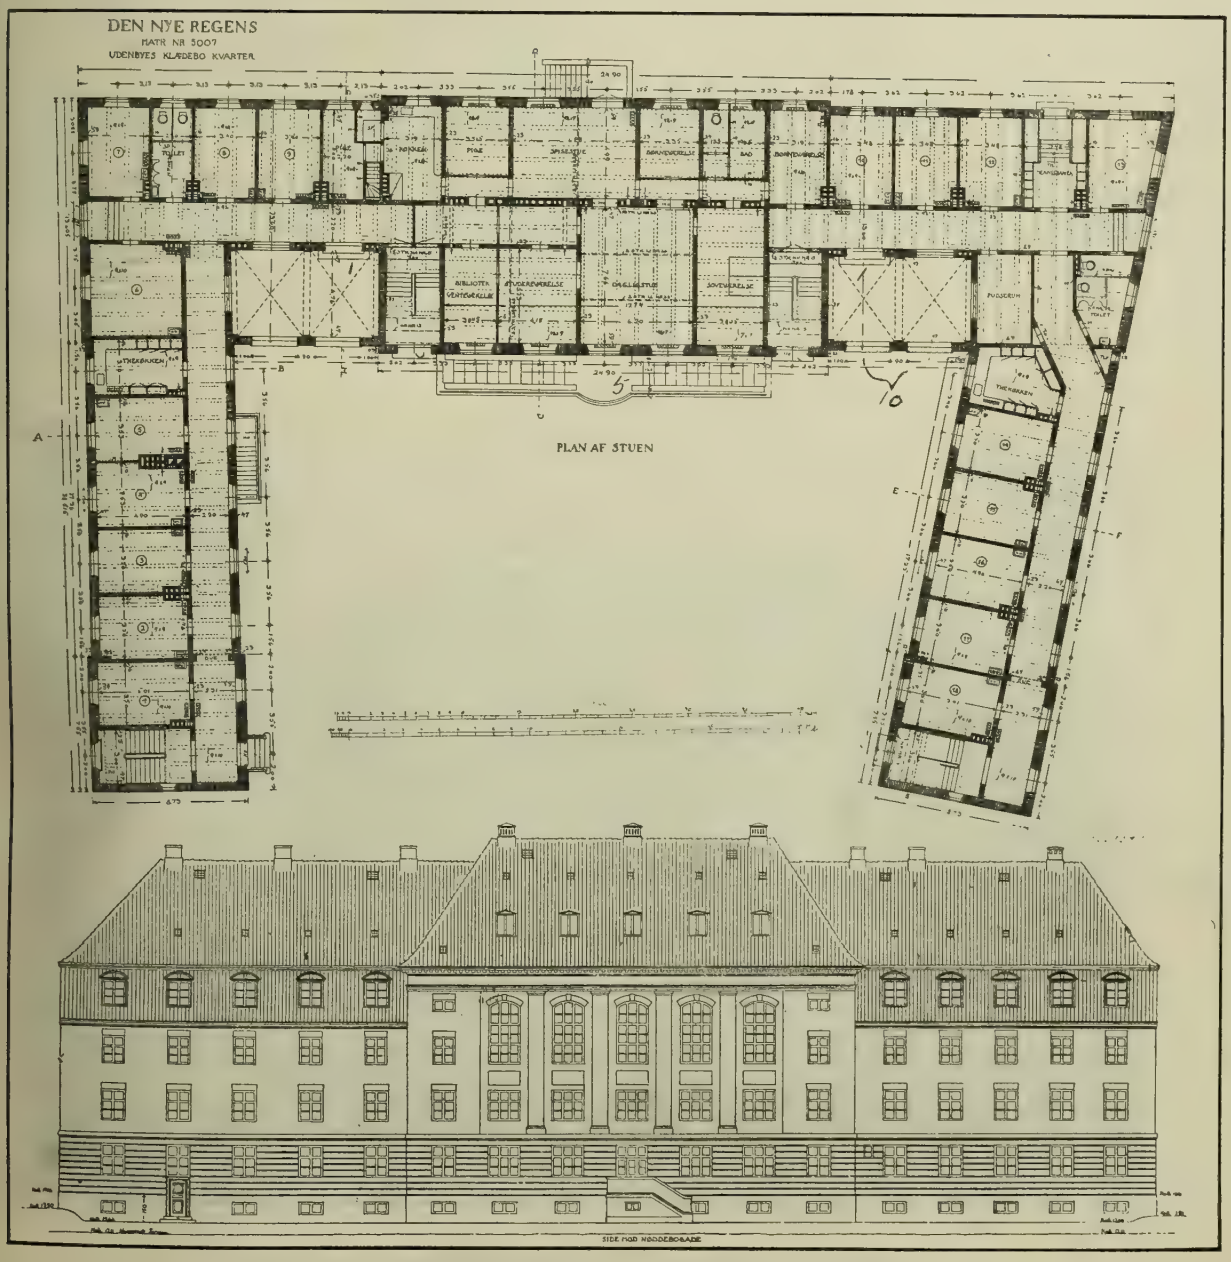
THE WATER-COLOUR SOCIETIES.

The two prominent water-colour societies have opened their summer exhibitions during the last week, and we must say they have both caused us much disappointment. At the Royal Society in Pall Mall we have generally found much that upheld its worthy tradition, but this year is one of the poorest in our recollection. There is plenty of able technique, such as in the work of the President, but there is an astonishing lack of good subjects and a large proportion of work which hardly seems to justify itself on the walls of an exhibition. The attractive galleries of the Institute at first sight make a brave show, but it is a dull round we have to make of the five hundred exhibits. The President, Sir David Murray, is an idealist, and his large picture in the principal gallery, with its delicate glow of sunlight, calls us to a world of ideal charm. Unfortunately we feel that he has overdone the point of interest in his picture and the result is not so broad and satisfying as it might have been. He has another picture, with Wells Cathedral as its central object, and in some respects that is better, and in another interior view at Wells he has triumphed over less obvious technical difficulties in the handling of architectural detail. What the verdict of painters would be in the fine picture of "The Coming of Night" (437) we do not know, but Mr. Spenlove-Spenlove has certainly given us a scene of mystery and admirable colour with a telling effect of breadth and impressiveness. Miss Lucy Kemp-Welch has probably never done better than in her picture where the tense action of a team of horses is very graphically expressed. Mr. H. Richter treats us to fine decorative effects of flowers in blues and greys in two pictures. The architectural effect of the Court of the Lions (the Alhambra) is powerfully portrayed under moonlight by A. Van Anrooy (367). Mr. A. Cox can always be relied on for good colour, as in his admirable "By the Sea of Galilee" (373). A clever little sketch of Notre Dame by Fred Lawson shows that even a hackneyed subject may often hold a fresh interest. Both in subject and treatment Mr. Terrick Williams generally succeeds, and he shows in "Twilight and Rain" what charm may come in a picture of conflicting lights in a cloak of enveloping purple and blue. This artist contributes two or three other dainty drawings. Several pictures might be named which help to give character to the exhibition, but it seems to us that the honours this spring will be with the exhibitions of individual artists.

WATER COLOURS.



One of the most successful exhibitions of flower paintings we have seen is the collection of water-colour drawings of the Tyrol, Italy, and England, by Rosa Wallis at the Walker Galleries. There are singularly pure and attractive drawings of various scenes in which the colour value of flowers is the chief attraction, from the campanula and ox-eye daisies in the Tyrol (12) to the garden of the post office, Bishopstone (8). There are over fifty drawings shown, in which one could hardly count one failure, and they have breadth of handling and a certainty of colour value which lifts them far above the average quality of exhibition work, and one is inclined to applaud and appreciate the modesty of the artist and the moderation of her prices. The fact is that we are turning out some creditable work even in these modern and decadent times.



The water-colours by Wilfrid R. Wood reveal a good deal of interest in architectural subjects (as well as the Dolomites), and the architect will dwell with interest on such a subject as the "Pal. Comunde, Arezzo" (37) or the excellent drawing of Blakeney High-street, Norfolk (32), which has a quiet charm in both its subject and its tone.

In the collection open at the Walker Galleries the drawings from Italy, Switzerland and England, by Harry Goodwin, look slightly overdone in comparison with the other collection; but at his best, like "The Sunrise from the Righi," the artist can exert a poetic fascination.

"Kilnfield," Puttenham.

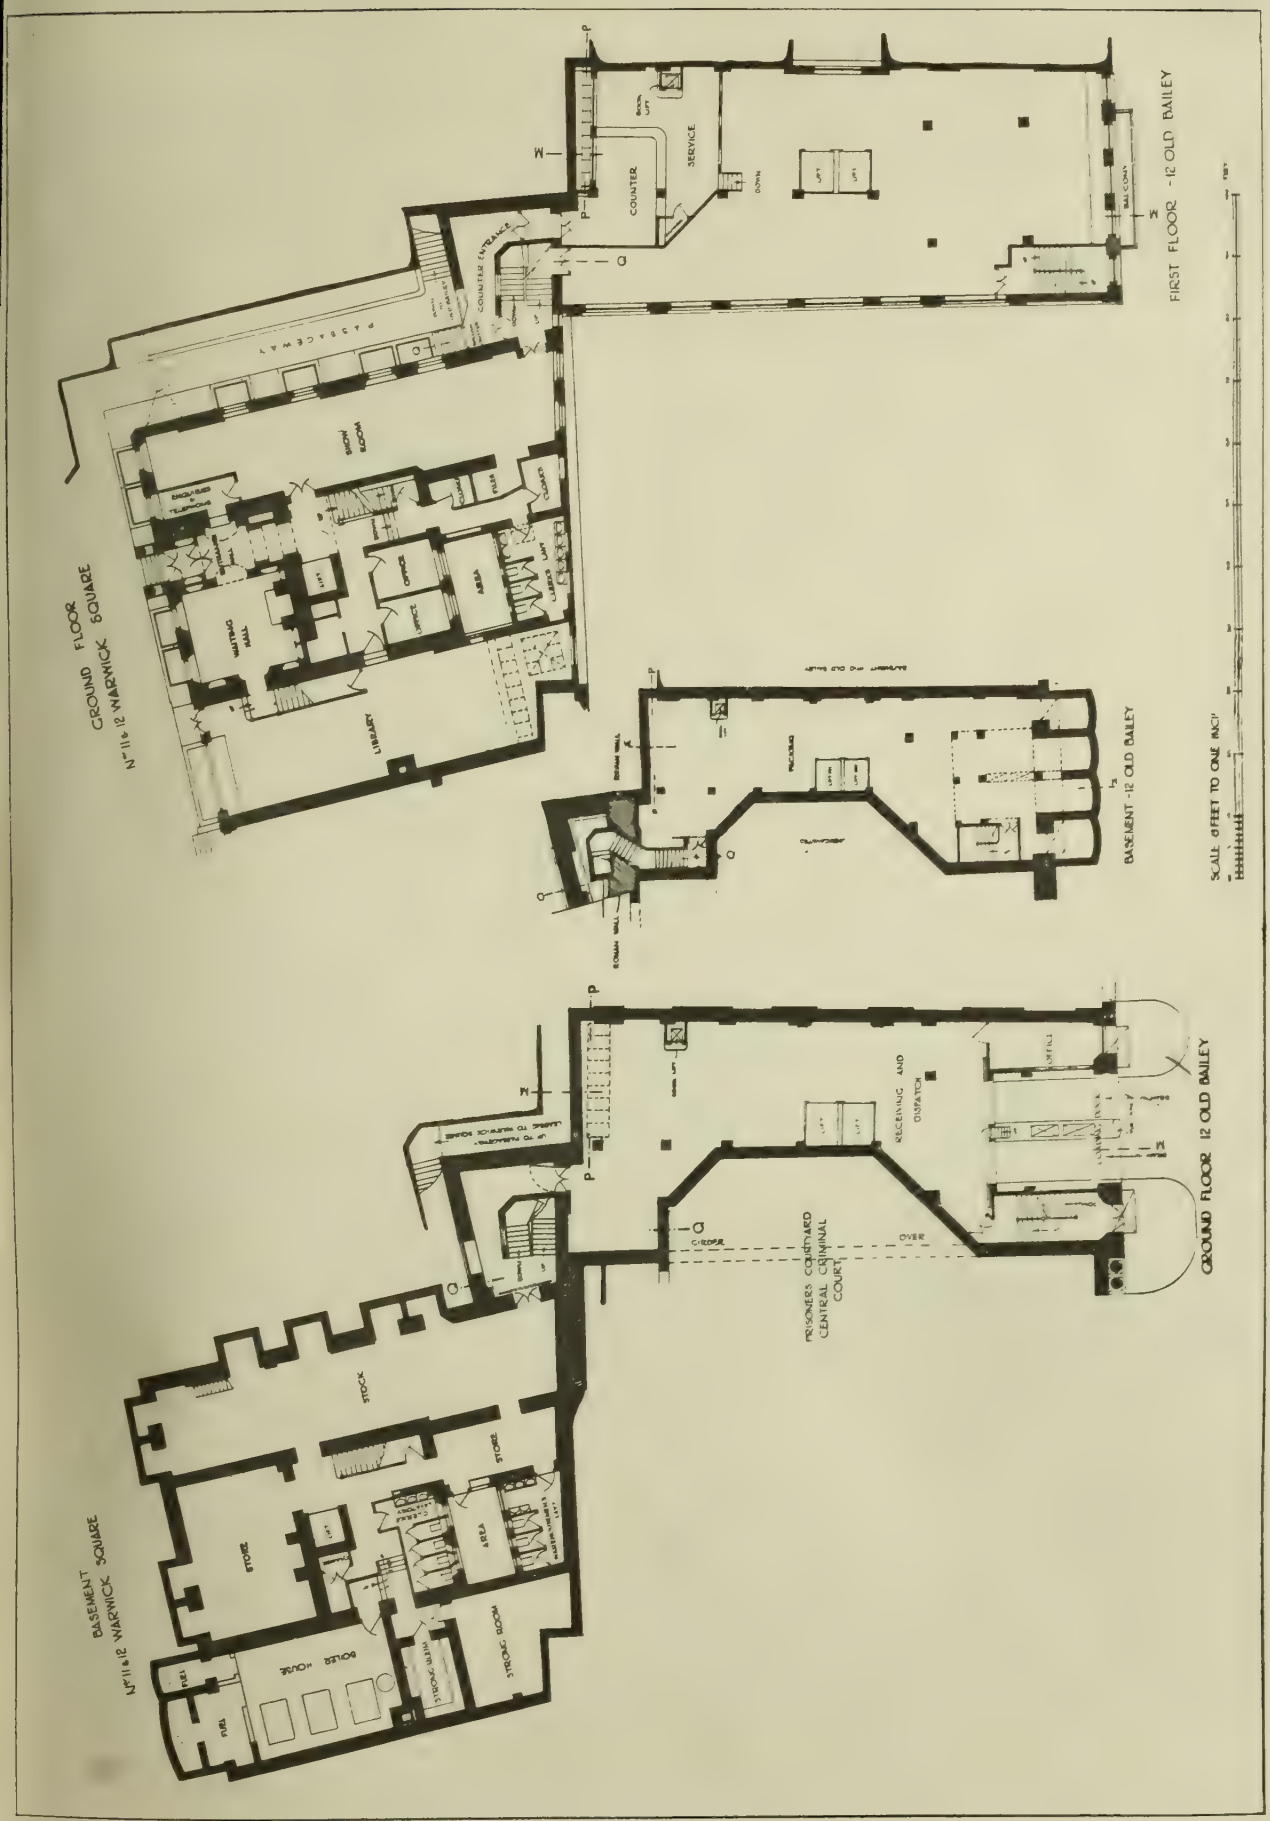
This house faces Puttenham Common, with a distant view of Hindhead. It is built of local brick of varying tones, with a roof of hand-made tiles. The staircase and some of the flooring is of chestnut. Mr. Jackson, of Compton, was the builder, and Mr. Alfred B. Yeates, F.S.A., the architect.

School at Welwyn Garden City.

The school at Welwyn is designed to give the maximum amount of light and ventilation, together with efficiency of organisation. Economy has everywhere been studied both in plan and in construction. The circulation is by means of open verandahs, facing south towards the play-grounds. The assembly hall is placed on the main north and south axis of the plan, and is lighted from the south; there are additional windows for extra light and for cross ventilation in the east and west walls. The entrance is in the south wall, and sliding doors are provided in order not to choke the circulation outside. Four emergency exits are provided. The class-rooms are lighted from the north by large windows, pivot hung at the top, and having hoppers at the bottom. The chief lighting is from the north owing to the even and steady light from that quarter, and the desks thus face east in order to receive a left-hand light. The question of cheerfulness and sunshine has been studied, and a large window (fitted with blinds) facing south over the verandah has been provided. The south wall has glazed and hinged doors opening out into the verandah, in which are placed hoppers for use when cold weather prevents the complete opening of the doors. The class-room floors are raised 4½ in. above the verandah floors. The class-rooms themselves may satisfactorily be used as play-rooms. Cloakrooms are provided with pivot hung north and south windows for cross ventilation. Entrance and exit is affected by doors which can be fixed open for extra ventilation without interfering with the circulation. Heating: The heating system provides for the necessary changes of air, and a point is made of running heating pipes in floor channels across door openings of class-rooms, in order to warm the incoming air when the doors are open during temperate weather. The system of construction consists of timber framing treated to resist decay, with two thicknesses of concrete slabs forming the walls between. The walls are plastered inside and treated with "Waterex" outside. Flat roofs are adopted as they allow economy in timber, drainage, and simplicity of construction, and there is an air space in ceilings and walls both external and internal, adding to thermal properties and negating the possibility of disturbances by sound as between the class-rooms. Electric lighting is used and gas points provided, where required. Mr. Louis de Soissons, A.R.I.B.A., is the architect.

Taunton War Memorial School Competitio

We give this week the design submitted Messrs. W. & T. R. Milburn, FF.R.I.B.A. the Taunton War Memorial School Competit and commended by the assessor. Messrs. burn's report states:—



It was realised that the most rigid econo in planning and construction would have to adopted, and in the first place it was deci that it would be necessary to concentrate u the accommodation specified in the conditi as "essential," together with the necess subsidiary rooms, and discard altogether extra laboratories, &c., which competitors w allowed to treat as optional. Special attention been paid to lighting, and direct cross ventilat obtained for all laboratories and lecture roo The memorial inscription has been provi for in the most conspicuous place in the entra hall, where it is proposed to fix a suitable bro tablet, on which, in raised letters, will inscribed the names of the fallen. The elevati are finished in rough-cast, with stone entra porch, base and dressings, in harmony with existing school buildings. The cost is estima at £9,860, including architects' fees.

"Amen House."

This building, situated in Warwick-squ and Old Bailey, E.C., is the new home of Oxford University Press, and will be kno as "Amen House." Its office entrance is Warwick-square. This house (No. 12), wh has been adapted for offices, is of the Restorati period, and the old outlines remain and so internal features of interest have been preserv In one of the corridors leading from the ho to the new warehouse a piece of London W has been left uncovered. The house has a w staircase with some fine carving, and on the fi floor is a panelled room with a carved ceili and fireplace. The panels have been painted the manner of the period. Contiguous to th houses a seven story warehouse has been bui Mr. Harvey Dyball, F.S.I., is the architect.

THE LATE W. DE GRAY BIRCH, F.S.A.

A TRIBUTE BY H. J. D. ASTLEY.

By the courtesy of the Editor, I am enabled to pay the following tribute to the memory of an old friend who I knew for more than thirty years.

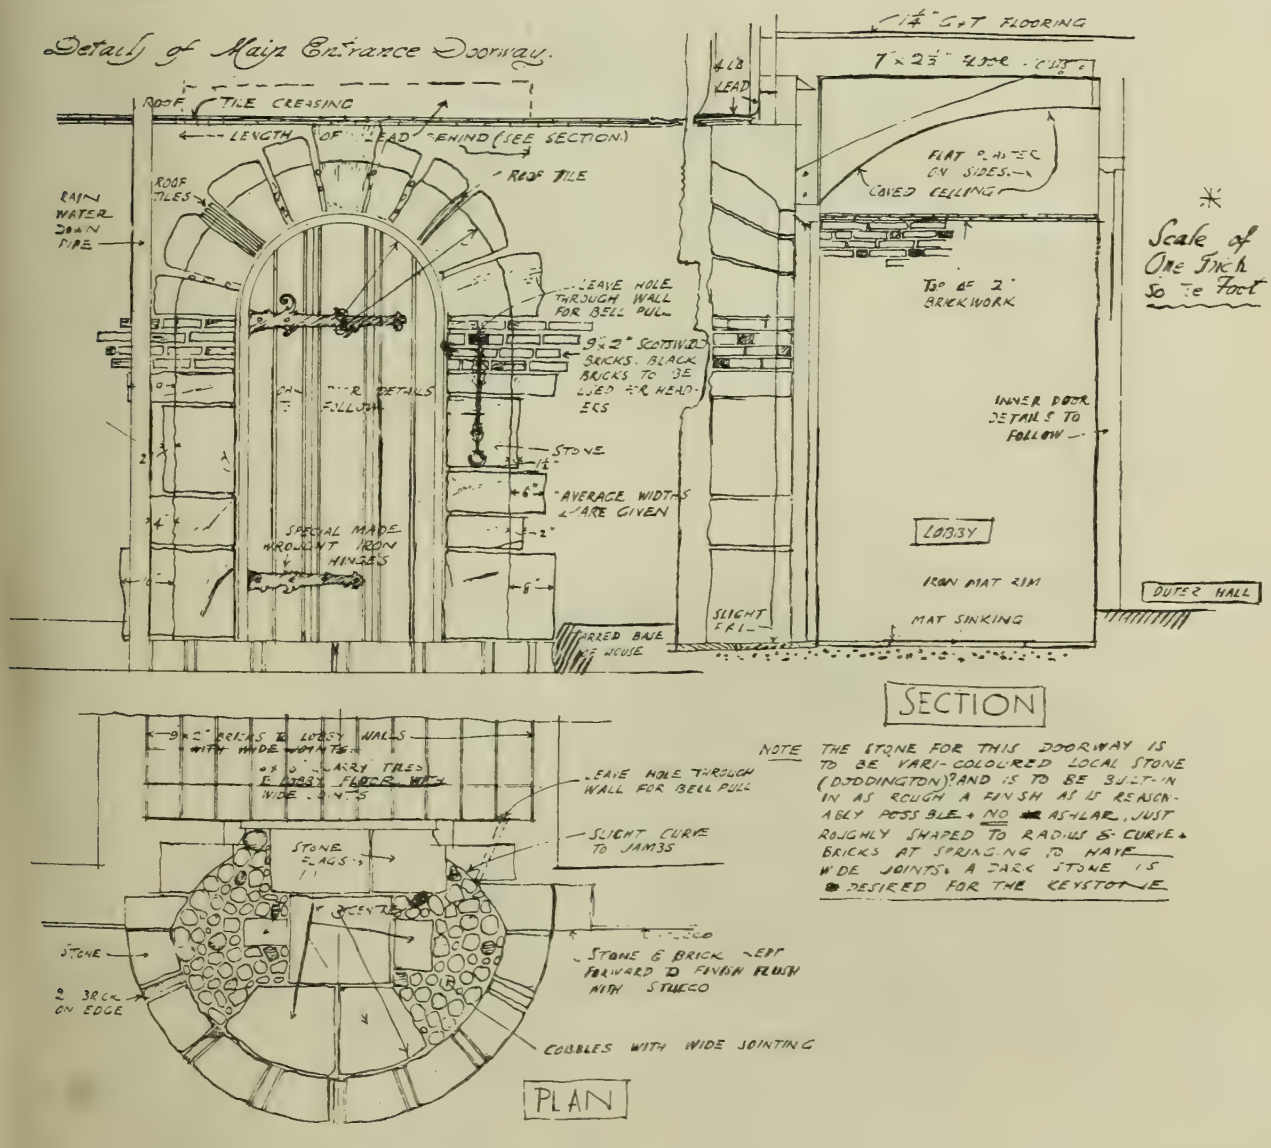
I first knew him as a member of the British Archæological Association, of which he was Secretary, and editor of the Journal for twenty-two years, and I can see him now as he sat at the Council table in the old rooms in Sackville-street, discussing in his quiet manner and with inimitable dignity some problem of archæological interest.

In 1897 I succeeded him as editor of the Journal, and I shall ever gratefully remember the generous help he gave me, not only in the duties of editor, but also in pointing out from the stores of his well-stocked mind sources and references for any paper I myself happened to be writing.

Though his principal business up to 1902 lay in the MSS. Department of the British Museum and in the study of palæography, and afterwards in cataloguing and arranging the library and MSS. of the late Marquis of Bute, the range of his interests was a wide one, and there was no branch of archæology in which he was not an efficient and competent guide. Dr. Birch was always a student, and his views on most subjects were definite and decided, though they were not always accepted by his fellow-archæologists. For many years there was no annual congress of the British Archæological Association which he did not attend.

Dr. Birch was always an interesting talker, and it was a privilege to listen to him in his own home, as he sat back in his armchair, with legs outstretched, fingers touching and eyes half-closed, discussing some abstruse problem of religion or science, when archæology or history was not to the fore. Some of his views on the former subject would not have altogether met with the approval of the "orthodox," but he could always advance good and plausible reasons for any views he expressed in either. He was not at all enamoured of the modern feminist movement, and its later developments made him look forward with some dread to the prospect of a coming "monstrous regiment of women," as Shakespeare puts it, in our ancient and time-honoured institutions!

He was always fond of travel, though he had not had many opportunities for extended sojourns abroad in the course of his long and useful life; but latterly he had spent most of his winters on the Riviera in the company of his devoted eldest daughter, and among the projects of his old age was the formation of an Anglo-French Society to investigate the Roman and other remains of antiquity in the South of France, now, alas! destined never to be fulfilled.



Thus one by one the links with the past are broken and the survivors are left to carry on their appointed tasks till they too, in the old Latin phrase, are numbered with the majority.

HOUSE AT LESBURY, NORTHUMBERLAND

This house is now being erected on a site sloping south to the river Aln, and is four miles from Alnwick.

The materials used are Scotswood hand-made sand-faced 2 in. bricks for facings; the walls generally are to be finished with lime roughcast left from the wood float, sand-dashed and distempered white, and Collier's orange-red tiles on the roof. Oak is being used for beams and joinery in the principal rooms.

The general contractors are Messrs. Carse, of Amble and Morpeth; and the architects are Messrs. Percy L. Browne & Glover, F. & M.S.A., of Pearl Buildings, Newcastle-on-Tyne, and 27, Newman-street, London.

WHITBY ABBEY

By WILLIAM HARVEY.

In connection with the reconstruction of rtain parts of Whitby Abbey that had been rown to the ground by shell-fire during a rman naval raid, I have received the fol- wing criticism of the methods adopted by M. Office of Works:—

"I cannot but regard with mixed feelings photographs showing the ruins of Whitby bey before and after restoration. It will be membered that the Abbey was damaged by German naval raid of December 16, 1914. is so evidently desirable to preserve those pressive remains of ancient piety which lie ttered through the country that I shall not accused of disregard for them in doubting ether their preservation is secured in such way as to retain any really authentic record. solemnly rebuild the jagged edges of muti- ed masonry; to imitate the gradual dis- egration of time by artificially creating a nous appearance, other than the authentic e, appears to me somewhat of a vain labour. e are told that the reconstruction has been ried out by the Office of Works 'in accord- ce with the original details,' but what thentic details were at hand in restoring tilated wall-work already in a dismantled dition? It is probably very well done as stage-ruin, but there is something pathetic d almost superstitious in spending such ns on these ghosts of the past, and at ch a time. It raises the consideration ether the money spent in such a way is t better contributed to living needs, leaving past to bury its own dead."

As the views here expressed seem to be presentative of an opinion held by a great ny persons interested in the preservation of "impressive remains of ancient piety," I came curious to learn just how this excep- nal piece of restoration came to be executed a body of conservators who have in other ses consistently set themselves to preserve storical evidence with a minimum of altera- n and to avoid restoration at all costs. The storic Buildings Branch of H.M. Office of orks granted full facilities for this inquiry, d have permitted publication of drawings d photographs in illustration of the actual cts of the case.

It would be difficult, in view of the terrible amples of restoration that have been mis- applied to Gothic buildings both in England and elsewhere during the past century, to speak one word in favour of restoration at the present moment now that architectural and popular opinion, so seldom joined, happen to be unanimous in its condemnation.

Whatever forms of architecture are desir- able, dummy restorations of a past and dead style are not of them, and the many judici- ously executed works of repair carried out by H.M. Office of Works sufficiently demonstrate the sympathy of that body with the popularly accepted view. But it is one thing to establish a rule for guidance and quite another thing to obey it blindly when it has been established. Each case must be judged on its merits, and no building is subjected to treatment by H.M. Office of Works until a searching inquiry into its circumstances of structural stability and artistic suitability has been first carried through.

As far as is compatible with safety, a ruined building in the custody of H.M. Office of Works is left severely alone, but it is not to be expected that many ruinous buildings will be so substantial as to need no attention whatever, and where works have perforce to be undertaken the least conspicuous methods are chosen in preference to the obvious and the intrusive. At Whitby an extensive ruin of the Abbey Church remains unroofed and mutilated and bearing evidence of the less artistic and more obvious repairs executed in former times in the crude masonry piers that have been built in the triforium arcades by other custodians of the building (Fig. 7).

The damage done by the German shells was fortunately confined to one part of the group of ruins, but though the West gable, princi- pally affected by the disturbing effects of the projectiles, is separated from the other parts of the ruin by a length of nave almost com- pletely demolished, the upstanding masses of its masonry are valuable since they serve to indicate the ancient limits of the building, and it is distinctly desirable in the interests of the whole scheme that this western outpost should be retained. The crumbling heaps of falling débris showed clearly enough that decay was actively at work before the time of the Ger- man raid. Nature proceeds relentlessly with the work of destruction scientifically set in train at the Dissolution, but we cannot afford to allow her operations to be completed with- out a protest. These ruins may be considered "dead" in that they no longer perform some part of their original function, but they are still very much alive in other respects.

Survivals from the past, they maintain a standard of achievement of more than his- torical interest, and it is not necessary to be an antiquarian or a technical expert to appre- ciate Gothic architecture, or to realise that its direct expression of artistic beauty intimately associated with constructional strength is something different from and something finer than our composite architecture of steel skeletons and applied decorations after the style of any desired period. Altogether apart from any respect which may be due to the interests of the religious communities for which the buildings were erected, it is possible to recognise a spiritual quality in the ruins of such abbeys as that of Whitby, and it need hardly be said that sincerity in architecture is as precious as it is rare. Evidences of clear thought and vigorous art are not dead things of the past to be buried in due course without concern or regret, and it is to the credit of the present conservators that they are fully alive to this appeal of the ancient monuments to be considered as matters of practical impor- tance to people of to-day.

The prosaic test of the turnstile demonstrates a very real popular interest not confined to any one class, but shared by all, and repairs are undertaken in the light of these experi- ences. Ruins allowed to moulder beyond a certain point become matters of indifference, and the German bombardment artificially pre- cipitated a great part of the wrought masonry facings, the mouldings and tracery of the west front of Whitby Abbey, to the ground. At the same time, the remainder of this part of the ruin was so disintegrated by the shock as to threaten almost immediate collapse. The stair turret was breached and left with the upper portion of its surrounding wall corbelled out above a gaping cavity, remaining frag- ments of tracery in the window of the N.W. aisle gable were thrown out of position and were only saved from falling by a curious accident (see Figs. 1 and 2). The central doorway of the west front was almost entirely demolished, its arch and moulded and panelled tracery falling in a heap on the ground.

That the effects of decay are cumulative as well as immediate is clearly shown by a photo-

Reproduced by permission of H.M. Office of Works.

Whitby Abbey.

Fig. 6.—Part of Set of Survey Drawings made in connection with the Repairs.

Reconstruction of Whitby Abbey.

graph (No. 3) taken six weeks after the bombardment. The upper part of the stair-turret has fallen, bringing with it the moulded jamb of what was once the great west window, and every atom of moulded tracery has dropped from the face of the wall on each side of the central door. The state of the masses of rough core was such as predicted other falls of material in the near future, and the reduction to a formless mound of what had been even in its ruined state an object of very great beauty. The preservation of what remained demanded that some treatment should be undertaken, and under the normal conditions of natural decay the problem would have been limited to the processes of upholding the ruin in a safe structural condition by the least conspicuous means.

The special nature of the case presented certain other aspects for consideration. Much of the ashlar, mouldings, and tracery that had fallen were found to be still in a recognisable condition, and could be identified, piece by piece, by means of detailed photographs which had been taken of the ruin before bombardment (see Fig. 1).

Except for the necessity of greater care in supervision, very little more labour would be involved in replacing these genuine fragments in position than in removing them to some place apart, and dealing with the mounds of core in such a way as would maintain them merely in position and as little unsightly as might be. Had the fragments of tracery and moulded work been removed to storage some appropriate place would have been required to be set apart for their preservation, and, to display them to advantage under museum conditions it would have been necessary to erect them somehow or somewhere. It was decided (on grounds of suitability) to erect them again in the positions they had occupied previous to the bombardment, and not through any rage for "restoring mutilated wall-work already in a dismantled condition." The writer of the criticism need not doubt the authenticity of the preservation, for the work has been carried out with the utmost fidelity to the state of ruin as indicated on pre-war photographs. Where original material was lacking and new had perforce to be supplied, and in places where the masonry had already become formless, sufficient rubble stonework was put into position to maintain equilibrium and continuity of support. There is a fundamental difference between the reverent replacing in position of veritable ancient details and the so-called "restoration" that begins with the purposeful demolition of old work and ends in the production of something glaringly brand new, to a design prepared to show how the old fellows would have done the work if only they had possessed our modern resources.

The criticism raises the question "whether the money spent on these ghosts of the past is not better contributed to living needs," and that is, of course, a matter concerning which opinions are bound to differ. Excavations of great interest are being undertaken at Whitby Abbey, and the repair of the west front is part of a larger scheme aiming at maintaining the whole group of ruins in safe condition.

OBITUARY

The late W. E. Willink.

Mr. Willink, whose death occurred recently, was one of Liverpool's most prominent architects. He was born in 1856 at Tranmere, and began his education at Liverpool College, and from there went to King's College, Cambridge.

After serving his articles with Mr. Alfred Waterhouse, R.A., he came to Liverpool and set up in practice for himself in 1882. Two years later he was joined by the late Mr. Philip F. Thicknesse and practised under the style of W. Willink & Thicknesse. In collaboration they designed many buildings, among the more important being the Cunard Building, Liverpool; Parr's Bank, Castle-street, Liverpool, in conjunction with Mr. Norman Shaw, R.A.; three elementary schools in Liverpool; secondary schools at Goole, Wallasey and Macclesfield; additions to King William's College, I.O.M.; laboratories at Liverpool University, Lancaster County Asylum Hospital and sundry branch banks for the Bank of Liverpool. They also did a large amount of ecclesiastical work, and contributed much work to the internal decorations of ocean liners for the Cunard Steamship Co., and the Booth Steamship Co. Mr. Willink was elected an Associate Member of the Royal Institute of British Architects in 1885 and a Fellow in 1898. He was also President of the Liverpool Architectural Society from 1897 to 1899. In 1920 Mr. Willink was joined in partnership by Mr. Harold A. Dod, and practised under the style of Willink & Dod. In conjunction they were responsible for the reconstruction of the Liverpool and London and Globe Insurance Co.'s offices, Liverpool; internal decorations of steamships for the Cunard Steamship Co., and the Anchor Donaldson Line; Messrs. W. Vernon & Sons' offices in the Cunard Building and sundry war memorials, &c.

ARCHITECTURAL SOCIETIES

THE EXAMINATION SYSTEM.

On March 21 Professor Beresford Pite, Hon. M.A. (Cantab.), F.R.I.B.A., lectured on "The Tendencies of Architectural Education," under the auspices of the Edinburgh Architectural Association, at 15, Rutland-square. Mr. T. Aikman Swan, A.R.I.B.A., F.S.A. (Scot.), presided.

In the course of his remarks the lecturer said the last century, and the latter portion of it, with which some of them had had a personal connection, could not be credited with the inheritance or the initiation of a systematic architectural training. By contrast with their Continental neighbours they had hardly any educational processes at all. The architect's education should, he considered, be directed by a recognition of the ultimate co-ordination of science and art, and that gave proper weight to the advantage of everything in the light of actual practice, and envisaged an ideal teacher in the person of an experienced and sympathetic practitioner. The tendency of schools of architecture should become essentially individual in dealing with history—schools of thought, not merely schools of design. With heavy examination schedules the student could not risk free excursions into fields of study; and freedom of artistic inspiration fainted and sometimes expired. The specialised education of the profession in its output should have no other deliberate aim than the standard of a first-rate office. Let them equip the student with a true estimate of the values and essentials of the buildings of the past, but let them insist upon the value of the predominant present; make him an honest representative of, not a rebel against, the age in which he lived. And let them set themselves the task of making architectural schools living centres in which the problems of to-day were educed in the concentrated light of the past, tending always to the ever-living present.

Sir John R. Findlay, in moving a vote of thanks, said Lord Curzon had recently been inclined to lament the fact of the disappearance of the cultivated patron, and the tendency for large buildings to be done by commercial bodies. He, personally, was not quite certain that Lord Curzon was well advised in that, and he was pretty well certain that with the so-called commercial patronage the architects of to-day and to-morrow had probably a wider scope and a greater assurance of lack of interference than they ever had under any regime of well-instructed private individuals. In a private capacity they might have their views and prejudices, but the moment they were up against the architect in any public capacity they dare not in that capacity express any opinion on a matter of taste, and set themselves in antagonism to the authority of the architect. The result was that more and more on the body of architects would rest the responsibility for the architecture they got in this country, and responsibility in the matter of their interest and care for architectural education.

Principal Laurie said the moral of the lecture appeared to be, down with the R.I.B.A. examinations. A good deal of what the Professor complained of was probably due to the external examinations; to the fact that they had one body of examiners and another body of teachers.

ULSTER SOCIETY OF ARCHITECTS.

A general meeting of the Ulster Society of Architects was held recently at Belfast. The President, Mr. R. M. Young, F.R.I.B.A., occupied the chair. On the motion of Mr. R. M. Young, seconded by Mr. R. I. Calwell, the secretary was instructed to send a letter of sympathy to the widow of Mr. S. Stevenson, C.E. The members agreed to become subscribers of the Wren Society. The Council of the Society has been in communication with the Royal Institute of British Architects regarding the shortage of skilled labour in the building industry, and reported on its effects locally. The council also reported on the action it had taken in regard to the proposed building scheme of the Belfast Education Committee, in which it had sent a deputation to that committee.

At the conclusion of the business, Mr. T. W. Henry, F.S., gave a lecture entitled "Some Reminiscences of a Recent Holiday on the Continent."

THE EARLY DAYS OF THE CHURCH

Sir Banister Fletcher, in a recent lecture at the Central School of Arts and Crafts on "Early Christian Architecture," said in the whole of human history there was no phenomenon so striking as the rise and progress of the Christian faith and its spread through the civilised world. Originating in a humble sphere of the community in Syria, a distant Roman province, it was by the fourth century of its era the recognised State religion of the Roman Empire—in spite of opposition and persecution from the learning, wealth and power of the most enlightened nation. The first Christian churches were of perennial interest as the forerunners of all the wonderful development in architecture and craftsmanship devoted to the service of the Christian religion throughout the world.

The Early Christians were poor at first—they had neither funds nor churches—and craftsmanship, too, was at a low ebb. Paganism was passing away and many of its temples were falling into disuse and so to ruin. Those ruins became the quarries from which the Christian church-builders obtained material more or less ready for service. A study of their churches revealed long lines of columns with dissimilar shafts, often supporting various types of capitals, surmounted by architraves formed of pieces placed side by side to form a continuous line regardless of their variety of carved ornament. The detail was mixed, but the general effect was dignified and imposing, and led the eye surely and directly to the sanctuary and the high altar, the centre of Christian ceremonial. The purpose of Christian churches was different from the purpose of the Pagan temples, for while one was erected as a shelter for the statue of the god, the other was required for the shelter of a congregation. The old style was thus adapted to the new purpose with as little waste and as much economy as possible, and this in itself gave those churches a special character. Sir Banister summarised the theories as to the origin of the basilican church plan, whether from the atrium of a Roman house, where persecuted Christians often met, from the scholae or meeting-places for the learned, or from the Roman basilica or hall of justice, with a semicircular apse for praetor and assessors. This style, both in respect to its predecessors and successors, illustrated the continuity of architectural development.

PRINCIPLES FOR FUTURE BUILDING

MR. WILLIAM DAVIDSON, A.R.I.B.A., writes, in reference to our report on the 7th inst., of Professor A. E. Richardson's lecture on this subject:—

Sir,—In Professor A. E. Richardson's brilliant and fascinating lecture at Cambridge there are many points of great interest, several of which, however, might be challenged.

For instance, how does he arrive at the percentage of qualified architects in this country—viz., 10 per cent.? If this is a fact, as he states, is it wise, in view of the present attempts to secure registration, to disclose this fact? Will the spreading of this statement be likely to increase the confidence of the public in the profession? I think the inferences are fairly obvious. If registration is to be merely a form of trade unionism it will assuredly fail.

It is quite needless to go over all the pros and cons for and against registration. What we want to get at is better building. History shows that every age gets the architecture it wants. This age is getting the architecture it wants. An architect is unlike the sculptor and artist in this respect—that he must have a client. Architecture is no longer inspired by religious and intellectual ideals but by economic and commercial considerations. We are trying to revive artificially, by schools and educational systems, an atmosphere which it is hoped will lead to the creation of good work. This will never succeed. The conditions which produced such gems as the Parthenon, the temples at Paestum, Karnac and Balbec, and other ancient and mediæval masterpieces can never be revived, nor, if possible, are they to be desired. They were produced under conditions of serfdom and slavery (not by men who were continually asking for 2d. an hour rise). Their greatness is largely due, also, to the use of fine material, and their beauty to the final fruition of generations of experiment, elimination of ugly features and generations of unrealised thought finally bursting forth through the subconscious mind into a material existence. What we want is not to create an artificial atmosphere but the right type of client.

I do not believe that the evolution of tradition has ever wholly died out at any time since Noah built the Ark. Here and there, in obscure places, some humble worker has kept alive the lamp of progress. In any case a good eclectic school is better than bad originality. There is no original work in ancient or mediæval art in the modern sense. Everywhere in past centuries we see evolution. Mr. John Begg, in a recent lecture on "Architecture in India," told us that, in some parts of India to-day, the tradition was so alive that an architect could hand the ⅛-in. scale and ½-in. scale drawings to the craftsmen and get the work carried out without detail drawings. (This might be called standardisation in the traditional sense.) That is an ideal state of affairs, and was probably the manner in which all, or nearly all, ancient and mediæval buildings were carried out.

In obscure parts of Britain, no doubt even to-day, there are still working at the building crafts men whose ancestors worked on the great cathedrals, abbeys and castles of past centuries. Might I even suggest that many of our best architects of to-day are directly descended from such mediæval builders? If so, they have the seed of the truth, evolution and progress in them. Great architects were produced without schools, and great architecture will be produced in spite of schools.

Beresford the novelist, in one of his stories, tells of an architect who was overworked. His nerves were so affected that every time he took out a blank sheet of paper to make a new design he saw the design already finished on what he knew to be a blank sheet of paper. As he could not remove it with rubber he realised that it was an illusion. His end is told in the story. This is very much our case to-day. We have studied the Greek, Roman and other orders, and Gothic detail until some of us can draw the orders upside down from memory, and string off the vertical and horizontal measurements like the multiplication tables, and tell the date of a Gothic moulding or carving to within half an hour (so we think).

As soon as we are confronted with a sheet of blank paper our imagination covers it with colonnades, arcades, entablatures, archivolts, imposts, pedestals, superimpositions of the orders and other stock details. This preconceived idea is certainly detrimental to honest design, evolved from structure and use of the building in question, and only leads to endless variations of old themes.

It may be, as Professor Richardson says, that these themes are played out, but a mere clothing of structure is not architectural art. Such a material as concrete blocks may produce good buildings, useful for their particular purposes, but it can never produce great architecture. In the sense of building material concrete blocks are a substitute. Professor Richardson is certainly wrong when he says that all the archæologist has done for us is to tabulate the styles. We know the conditions which produced the temples, mediæval cathedrals, abbeys, parish churches and castles—viz., religious sincerity, ritualist formula, monastic discipline, domestic arrangements and implements of war. The structural and geometric principles and decorative enrichments were not arrived at by applied mechanics, graphic statics, mathematical formulas and haphazard and meaningless design, but by natural evolution from the first mud hut, by failure, experience, tradition and an intellectual perception of the power and beauty of allegorical and symbolic representations of religious and chivalrous ideals.

This is a vast subject, and cannot be treated within the scope of one letter. The proportions of such buildings as Salisbury Cathedral and King's College, Aberdeen, were obviously not arrived at by mere mathematical formulas but by generations of experiment and traditional experience. To-day we have not the support of the sculptor and decorative artist which builders had in bygone ages. The beauty of the Parthenon is greatly enhanced by its exquisite sculptured frieze. The nobility of the Medici Chapel is largely, if not entirely, due to its superb sculptures.

To-day sculpture is mostly applied, rarely organic. The brothers Adam are responsible for this in Scotland. Their carving is merely marble and plaster ornament applied to stonework. (The originals may be seen in the museums at Rome and Naples.) The great glory of Gothic is its early stone carving. Chartres Cathedral, Wells Cathedral (north porch spandrils), Stone Church, Kent, Christchurch Priory, and the Angel Choir at Lincoln, to mention a few, and particularly the nave caps at West Walton, Norfolk, are perfect specimens of architectural sculpture. They exhibit at its best the great principle of acceptation of the limitations of the medium.

In education, as Professor Richardson says, we cannot ignore the past in architecture any more than in other departments of science and art, but during the last thirty years architectural education has tended to produce more antiquaries than designers. Much has been said on this subject, and much more might be said. The old pupilage system produced some of our best men, and the value of schools is that it gives pupils in second-rate offices a chance of acquiring some knowledge of the work of the great masters of the past. Our aim should be, as Professor Richardson so ably says: "The realisation of new truths arising out of the observation of principles which are eternal." We do not need to invent a new style of architecture, but, as Professor Lethaby said in a recent letter to the writer "We need the idea of living, advancing sufficient structure"—a full appreciation o present-day requirements and structura problems and a right use of new materials Religion, unfortunately, has ceased to inspir us, and the church is no longer our mai client. Building is now in the hands of com merce; but it must ever be remembered tha the rise and fall of national ideals (spiritual intellectual and economic) are mirrored in country's architecture.

[As we received Mr. Davidson's letter to late for publication in our last issue, w obtained the following reply from Professo Richardson]:—

Sir,—I must thank Mr. Davidson for ampli fying my remarks. In his letter he states, wit precision, the attitude of many towards th scientific art of building. In the midst of s much learning there is apt to be confusion o thought. Architects and others have been s occupied thinking about good taste and deport ment that they have ceased to care about th main stem of the scientific art, which i rational building. Architecture to-day i reminiscent, but it is lifeless; there is littl joy in it, because the popular idea is that form alone matters. Surely it is reasonable to hol the opinion that use and function determin plan, and that the horizontal or cellular trac of the plan provides the nucleus of the struc ture, which can be developed in these dimen sions at will. In this line of thought will b seen an approach to the true theory of organi building, irrespective of style, period, taste or any other catchword.

The attitude of artists and laymen to-da seems to be that of the collector of antiques all desire a good specimen, and, failing th genuine article, they fall back on exact repro ductions.

Variety and change are the soul of vita architecture. All organic structures that ar something more than crude building are the result of the interaction of established theories and ideas; agents of tradition and factors o environment. The ever-changing conditions o life, corresponding to life itself, offer the necessary stimuli. The conditions and the en vironment should shape the organism. The curious thing is, so few understand the mean ing of structure, which, rightly comprehended, is architecture.

Cottage Homes at Knaresborough.

Cottage Homes at Scarborough.

Mr. Stephen Wilkinson, A.F.C., F.R.I.B.A., Architect of the North-Eastern Area of the L.N.E.R.

[The homes at Scarborough were recently opened by Mr. William Whitelaw, Chairman-Director of the L.N.E. Railway, and those at Knaresborough by Mrs. Stevenson, of Harrogate. These Homes will be occupied by railway servants who were incapacitated in the war. The accommodation in all cases consists of: ground floor—living room, and scullery, &c.; first floor—three bedrooms and bath, &c. During the last two years some forty of these homes have been opened at various centres of the L.N.E.R. system.]

LEGAL SECTION

NOTES ON CURRENT CASES

The Private Street Works Act.

THE recent case of Mayor of Chester *v.* Briggs (1924 1 K.B. 239) raises a point of some importance in connection with the Private Street Works Act, 1892. The appellants as the urban sanitary authority for the city and county of Chester had resolved to do certain street works to a street known as Grange Road, and the Surveyor had prepared specifications with plans and sections and an estimate of the expense and a provisional apportionment based on frontages alone amongst the premises to be charged under the Act.

The estimated cost of the proposed works was £3,933 13s., including a 5 per cent. commission or profit for the appellants, and the proposed works were to be constructed to cope with the present heavy traffic on the road, and on the basis that this road would in future relieve the traffic on a first-class main road repairable by the appellants, and the expense of the proposed works was greater on this basis than would be the case if such road were only to be constructed in accordance with a specification required to cope with traffic on roads similar in class to that road.

The appellants had not resolved, as they had power to do under section 15, to pay any portion of the expenses out of the rates.

The respondents, who were some of the owners to be charged, had lodged objections under section 7 in which many points were raised, but the following seem to be those material to the actual decision delivered in the case—(*c*) that the provisional apportionment was incorrect in respect of the degree of benefit to be derived by users of the road or the value of the work already done by the owners of certain premises. (*e*) That the estimated cost of the new 9-in. sewer had been levied on the whole of the frontagers notwithstanding the fact that a sewer to which some of the objectors' property was connected already existed, and the cost of any repair to the existing sewer should be borne by the Council. (*i*) That the estimate was more costly because of the user of the said road by certain heavy traffic and that the owners of such heavy traffic should pay such additional cost occasioned by such traffic.

The justices had found that the proposed street works were necessary, but that having regard to the designed object of such road as a relief road it was unreasonable that the owners (including the respondents) should bear the whole expenses of such works, that a portion of the expense of such works should be borne by the appellants, and that under section 15 the appellants could, had they so chosen, have resolved at any time to contribute a portion of the expense of the proposed works and that section 8 subsection (1) empowered the justices to amend any resolution of the appellants passed by them as an urban authority under the said Act, and that the resolution should be amended so as to make the Council contribute 15 per cent. of the cost of the works.

The Divisional Court held that, in the absence of a resolution by the urban authority under section 15 that portion of the expenses shall be paid out of the district fund or general district rate or other rate, the justices have no power so to amend the resolution which is before them as to add this provision, as that would, in fact, amount to the justices passing a resolution for the urban authority. The justices can, however, it was held, under section 8 decide on proper objection taken (section 7) that certain works are unreasonable, and the case was remitted to the justices with a direction that section 15 gives to the urban authority and to that authority alone the discretion on the question whether there shall be a contribution on the part of the urban authority to the expenses of the works, and the justices have the duty of considering the questions raised before them by the objections with the knowledge that whatever else they may lawfully do they cannot act as if a resolution under section 15 had been passed.

Mr. Justice Salter is reported to have said in giving his judgment, "This is a Statute which imposes upon individuals the cost of works which are partly for their own benefit and partly for the benefit of others. In considering an objection under section 7 (*d*) that the proposed works are unreasonable, the justices are entitled to consider amongst other things whether the proposed works are reasonable in the sense that it is reasonable that such works should be done at the frontagers' expense."

It may be useful to set out the objections permitted by section 7 and to refer to some of the objections in this case other than those set out above, and to then further consider the effects of this case.

By section 7 notice of objection may be given on any of the following grounds—

(*a*) That an alleged street or part of a street is not or does not form part of a street within the meaning of the Act.

(*b*) That a street or part of a street is (in whole or part) a highway repairable by the inhabitants at large.

(*c*) That there has been some material informality, defect, or error in, or in respect of, the resolution, notice, plans, sections, or estimate.

(*d*) That the proposed works are insufficient or unreasonable or that the estimated expenses are excessive.

(*e*) That any premises ought to be excluded from or inserted in the provisional apportionment.

(*f*) That the provisional apportionment is incorrect in respect of some matter of fact to be specified in the objection, or (where the provisional apportionment is made with regard to other considerations than frontage as hereinafter provided—section 10) in respect of the degree of benefit to be derived by any persons or the amount or value of any work already done by the owner or occupier of any premises.

Besides the objections we have set out above as raised in this case there were many others of which we will mention two. It was objected that no consideration had been given in the preparation of the apportionment to the provisions of section 10 (*a*) of the Act and that the apportionment in apportioning the cost of making the street should include premises which do not front, adjoin, or abut on the street or part of the street but access to which was obtained from the street which would be benefited by the said works. It was also objected that a part of the said road had been repaired by some of the owners of property fronting thereon and that such owners should not pay as much per yard frontage as other owners who had not contributed to such repair.

These are questions of great importance to those owning property abutting on roads which have not been taken over by the local authority. Building estates are frequently laid out with one principal road running through the estate and with subsidiary roads leading into it, and on such estates the owners or occupiers of property are under covenant to contribute to the maintenance of the roads as a whole quite apart from the property abutting on any particular road. These covenants are not rigidly enforced and the roads get out of repair, and when traffic owing to the development of the district comes upon them the local authority decides to make them up either under the Public Health Acts or t Private Street Works Act. Having regard the common liability of the owners *inter* towards the roads under the covenants bindi the estate it would seem equitable in such ca that the local authority should avail the selves of the powers given them in section of the Private Street Works Act to inclu in the apportionment properties which do abut on the street but which will benefit the contemplated works, and to consider a what work has already been done on t street by the owners and occupiers; and, wh the works are more extensive owing to t desire of the local authority to make t street capable of relieving other roads repa able by the authority, to contribute towa the works themselves.

As regards this latter point in these days high rates local authorities are hardly inclin to place a burden upon the rates which th can place on the shoulders of private indi duals, and the decision in this case that t justices cannot enforce any contribution in t absence of a resolution to contribute seems leave the private individual without adequ protection unless the decision can be read enabling the justices to hold under the obj tion section 7 (*d*) that in the absence of su a resolution the proposed works are "unre sonable or that the estimated expenses excessive," and although we express no opin on the point this seems arguable from t judgment of Mr. Justice Salter, who, as quot above, put it that the justices can consid amongst other things "whether the propos works are reasonable in the sense that it reasonable that such works should be done the frontagers' expense."

As to the other two objections as to fro tagers only being charged with the apportio ment, and the consideration of work alrea done, it has been held that where the loc authority have not resolved that the apportio ment of expenses shall be otherwise th according to frontage the justices have power to apportion the expenses otherwi than according to frontage (Bridgwater C poration *v.* Stone (72 J.P. 487)), and in t same case it was also held that if the loc authority have passed no resolution gard shall be had to the degree of benefit the amount of and value of work already do the justices in hearing objections under secti 8 (1) to the provisional apportionment can reduce the apportionment in respect of t degree of benefit or the amount and value work already done.

These two latter questions are not precis on the same footing as the question of cont bution under section 15 by the local authori the subject of direct decision in this ca for they are dealt with in sections 7 and

Under section 7 the grounds of objection paragraph (*f*), which we refer to above, material. That paragraph provides that jection may be taken "that the provisio apportionment is incorrect in some matter fact to be specified in the objection or (wh the provisional apportionment is made w regard to other considerations than front as hereinafter provided) in respect of the gree of benefit to be derived by any pers or the amount or value of any work alre done by the owner or occupier of any mises." The words " as hereinafter provide refer to section 10. That section provides t the apportionment of expenses against premises fronting, adjoining, or abutting on street or part of the street in respect of wh the expenses are to be incurred *shall* un the urban authority otherwise resolve be portioned according to the frontage of respective premises, but the urban autho *may* if it thinks just resolve that in sett the apportionment regard shall be had (*a*) the greater or less degree of benefit t derived by any premises from such wo

(*b*) the amount and value of any work already done by the owners or occupiers of any such premises. "They may also if they think just include any premises which do not front, adjoin, or abut on the street or part of the street, but access to which is obtained from the street through a court, passage, or otherwise, and which in their opinion will be benefited by the works, and may fix the sum or proportion to be charged against any such premises accordingly."

We referred to this section in our issue May 26, 1922, and showed that it included a private road made primarily for the purpose of giving access to the street (Newquay Urban District Council *v.* Richard, 1911, 2 K.B. 846, *The Builder*, Nov. 24, 1911).

From the above observations we hope we have made it clear that where a private street is not sewered, levelled, paved, metalled, flagged, channelled, made good and lighted to the satisfaction of the urban authority, if the authority act under section 6 prima facie the expenses will be apportioned on the premises fronting, adjoining, or abutting upon such street, that the local authority has power under section 10 to make it a term of the resolution passed under section 6 that the degree of benefit to be derived from such works by any premises and the amount and value of any work already done by owners or occupiers of such premises shall be taken into consideration, and also by resolution to include other premises as specified in the Act which do not actually front, adjoin, or abut on the street, but that in the absence of resolutions to that effect the justices cannot either reduce the apportionment in respect of the degree of benefit of work done, nor make an apportionment on premises not fronting, adjoining, or abutting on the street.

Further, that under section 9 the urban authority may include in any works to be done under this Act any works which they think necessary for bringing the street as regards sewerage, draining, level, or other matters into conformity with any other streets whether repairable or not by the inhabitants at large: that under section 15 they may pass a resolution to contribute out of the rates to the whole or any part of the expenses of private street works, but that in the absence of a resolution to that effect the justices cannot make an order as though a resolution had been passed.

It will be seen that an almost absolute discretion is vested in the local authority in these matters, and although this may not be so material where the resolutions only go to apportioning liability between two classes of property frontagers and those having access and benefiting by the works, it does certainly appear that some further powers should be given to justices where additional works for the public benefit are included and a resolution on a point in which the local authority itself is directly interested as to contribution from the rates is withheld.

An Action against Building Contractors.

A case recently reported in the *Times*, Brandon and Wife *v.* Osborne Garrett & Co., Ltd., and George Parker & Sons, Ltd., raised a rather unusual point as to damages. The plaintiff and his wife had visited the first defendant's premises on business, they all being in the same line of business as hairdressers, and had been directed to a department which had a glass skylight in the roof. Whilst they were standing there the skylight fell and a piece of glass struck the male plaintiff. It did not cut him nor even penetrate his hat, but he had been a sufferer from neurasthenia, and he sustained injuries by shock. His wife was not touched by the falling glass, but, seeing what had happened, she endeavoured to pull her husband out of the way and sustained a strain which set up an old trouble in her leg, the consequence of thrombosis.

The cause of the skylight falling was that some men in the employ of the second defendants were engaged in repairing the premises and were working on some leading which ran alongside of and six feet above the skylight. A hole had been cut in the roof in order to enable builder's material to be brought up, and in covering this hole with a tarpaulin a piece of wood had fallen through on to the skylight, thus breaking it. The negligence consisted in not having taken precautions by covering the skylight with boards and in allowing the piece of wood to fall on to it, and the proceedings seem eventually to have been continued against the contractors alone.

The point raised upon which it was said there was no direct decision in the English Courts was whether, as no direct injury had been done to the wife by the negligence of the defendants' servants, she could recover damages in respect to an injury sustained by her in her voluntary efforts to save her husband from injury, as she herself was not trying to escape any impending danger. Some Scottish cases and an American decision were cited, and in the result the Court held that in such circumstances it was a question of fact to be determined, first, whether the injury to the plaintiff was the natural and probable consequence of the act of the defendant, and, secondly, whether the plaintiff had been guilty of contributory negligence. The female plaintiff in this case was not herself in a position of perfect safety. She might reasonably have anticipated that some of the glass would fall upon her, and the Court held that acting in such circumstances instinctively to save her husband there was nothing wrong in that act and she had not been guilty of contributory negligence. The Court awarded damages £35 to the husband and £25 to his wife.

In the course of his judgment the learned judge is reported as having said that in the American case, Eckhert *v.* Long Island Railway (43 New York 502) it had been held that there was an obligation on the plaintiff in that case to try and save a child who was on the track of an on-coming train if he thought he could do so without injury to himself, but without going so far as that he (the judge) considered "that where one person saved another through a combination of acts, some his own and some another's, it was for the jury to say whether the injury was the natural and probable consequence of the defendant's act, and whether there had been contributory negligence." It is a little difficult to say on this judgment as at present reported what this passage means and whether the fact that the wife herself was in the danger zone was material or not, but it would appear inferentially that it was, for being herself in a position of danger from the act of the defendant she acted instinctively to save another in the same position, and we think that when, as quoted above, the judge is reported as having said, "through a combination of acts some his own and some another's," he must have been referring to the original act of negligence on the part of the defendant and the act of the plaintiff, for, if the injury has to be the natural and probable consequence of the defendant's act of negligence, it appears that the plaintiff must himself be within the danger zone of that act of negligence and not voluntarily have come into it even to save another, and this limitation for liability for an act of negligence, at any rate where the defendant is a private individual not under statutory obligations to the public, would appear reasonable.

LAW REPORT.

Architect's Action for Fees.

Mr. Justice Rowlatt recently gave judgment in an action brought by Mr. Frank Harold Bromhead, an architect, of East Retford, against the Kirby Moorside Rural District Council to recover fees for professional work done by him as an architect for the defendants in connection with a housing scheme.

His lordship said the appointment was subject to an agreement in writing, but no such agreement was ever made. In the meantime, the plaintiff went on with the work. The scheme, however, fell through and the plaintiff claimed his fees. The defendants were willing to pay £336 and brought that sum into Court, but for anything further they said they were not liable because their contract was not under seal. But the defendants were a Rural District Council and therefore they were not limited by the Section of the Statute which had reference to Urban Councils. They were not protected against a claim of *quantum meruit* for work done which they had actually had the benefit of, and whether the plaintiff could recover on that basis was the question in the action. The point had been taken that *quantum meruit* had not been sufficiently pleaded, but he did not share that view. He thought it was sufficiently pleaded. The real point set up by the defendants was that there was no contract at all. The agreement in writing was never entered into, but work was done pending the contract. It was done at once and at the request of the defendants, and it was done by a professional man whose time was his livelihood. He could not work for nothing. Defendants said that the plaintiff was employed on the basis of "houses erected" for them. That was in the defendants' resolution which they passed, but it was never communicated to the plaintiff. In the events that had happened there was nothing which said that the plaintiff should do 18 months' work for nothing. He was not bound by the resolution at all. Then the defendants said that the whole thing was contingent to the scheme going through. In his opinion the plaintiff must be regarded as a stranger to all this. The broad justice of the case was that the plaintiff must be paid for the work he had done. The question of amount was a troublesome one. Housing was a national matter in 1918, when the scheme was started, and everyone was anxious that work should be proceeded with.

In the circumstances he awarded the plaintiff £675 and judgment would be entered for that amount with costs. The £336 paid into Court would be paid out to the plaintiff.

LONDON COUNTY COUNCIL SCHOLARSHIPS

The London County Council is prepared to consider applications for the following scholarships from British subjects, provided their parents or guardians live in the County of London:—

1. Intermediate Technical or Art Scholarships, providing free tuition at recognised schools in London and, in some cases, a maintenance grant, for students from 16 to 18 years of age in engineering, technical optics, architecture and building, chemical trades, art, &c. Candidates must possess scientific or artistic ability, and their general education must be up to matriculation standard.

2. Senior Scholarships in Science and Technology, or Art and Artistic Crafts providing free instruction at full-time day courses at institutions of University rank or at which advanced instruction in science, technology, art, &c., is given. They will enable students who are engaged in trades or occupations, and have attended evening classes for at least two years to give up their day work and pursue a course of advanced instruction related to their employment. In some cases a maintenance grant, assessed on the merits of each individual case, will be provided, but it will not exceed £160 a year. If the candidate is over 21 years of age and is self-supporting, he, or she, must be ordinarily resident in London. Candidates must be not less than 18 years of age.

3. Free Places at the Imperial College of Science and Technology for candidates at least 18 years of age desirous of taking a post-graduate course in chemistry, engineering, &c.

4. An "Archibald Dawnay" Scholarship in Civil Engineering of the value of £110 a year, providing training for two or three years at an approved polytechnic or technical school for a student between 16 and 18 years of age.

Forms of application and detailed particulars may be obtained from the Education Officer, The County Hall, Westminster Bridge, S.E. 1.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

*** We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.*

Restoration of Old Cottages.

[Reply to Inquiry in Last Issue.]

Sir,—I note "Restorer's" query in your last issue. I have carried out several of these operations in the course of my practice. The first was one of making a pair into one house. My method in each case was to insert a stoneware vitrified and glazed dampcourse in cement to the thickness required, for one course of the bricks (I am assuming "Restorer's" cottage wall is of brick) in such short lengths as the wall permitted according to its soundness. This dampcourse is also ventilating for wood floors near ground. In one case the wall was 18 in. thick and about 70 years old. All the attempts were quite successful and no settlement occurred. I prefer above to blue brick: (1) it may be the brick is too thick for an old-time brick course; (2) there are more joints for leakage in the wall; (3) all blue bricks are not damp-proof; (4) if ventilation is wanted other provision has to be made. Should the earth outside cottage wall be level with or above floor line, remove the earth for about 18 in. wide to 3 in. or more below the new dampcourse and pave with brick or concrete to a fall away from house.

"Practice."

A firm of manufacturers of a patent insulating building board has sent us suggestions for an alternative treatment to the proposed cutting in of a dampcourse to the old cottages to be restored. They suggest placing their product against the existing surfaces and then covering same with plaster, or a one-eighth coating of Sirapite or similar preparation, which they claim will prove efficient and economical. We have forwarded these particulars to our correspondent, who will be able himself to judge their merits.

Damage by Workmen.

[Reply to Inquiry in Last Issue.]

An artisan, or other workman, in the law is classed as a servant, and it is his bounden duty to take all due and proper care of the property entrusted to him by his master. A workman impliedly warrants that he possesses and will exercise in the task he undertakes reasonable skill and competence. Should the workman fail to exercise reasonable care and skill, and such failure results in damage to his employer, or, again, when property is injured by the gross negligence of the workman, then an action at law for negligence lies.

If the work is so negligently done by the workman as to be useless, no remuneration is recoverable by him.

Where the workman is habitually neglectful in respect of his duties, he may be dismissed.

There is, however, no neglect or breach of duty when the loss is occasioned by mere accident or circumstance beyond the servant's control.

The word "accident" is often used loosely. It is a question of degree, and depends on the circumstances of the case; also whether the so-called accident could have been prevented by taking precautions necessitated by the circumstances.

In general it would appear the loss falls on the employer, who is primarily responsible in the first instance.

The popular idea of the relationship of employer and employee now is such that the latter is looked upon as saved from any action the employer is entitled to take at law.

The following cases might be referred to:—Countess of Salop *v.* Crompton (1600) Cro. Eliz. 777, 784; Stumore Weston & Co. *v.* Breen (1886), 12 App. Cas.; Sease *v.* Prentice (1807), 8 East 348; Combe *v.* Simmonds (1853), 1 W.R. 289; Purdow *v.* Webb (1842), Car. and M. 531; Walthew (1707) 11 Mod. Rep. 135; Nickson *v.* Brohan (1713), 10 Mod. Rep. 109, 111.

Sir,—The employer is certainly liable for damage or breakage by accident on the part of one of his workmen. Where culpable negligence can be proved, it is, of course, a different matter.

X. Y. Z.

Hard-wearing Dado.

[Reply to "Landlord."]

We have received suggestions from two firms of specialists recommending their respective materials, both of which are in the form of building boards. In one case the material is polished to a fine surface after fixing and the upkeep consists simply of removing dust with a stiff brush to restore the polish from time to time and an occasional application of polish. In the other the material is afterwards coated with one of the new plaster paints, the claim being that this will provide an indestructible job needing no upkeep. We have sent on these particulars to our correspondent.

Washed Sand.

[Reply to F. J. Robertson.]

Washed sand does not imply "screening" unless so specified, but only refers to the operation of passing a stream of water through the material to carry off loamy impurities, which is not in every case necessary where the sand is by nature clean and free from impurities. Sand or mortar should not be too fine, but the architect has power to exercise reasonable discretion in rejecting any which is too coarse for building purposes. If any special gauge for screening is required it should be specifically stated.

Measurement of Brickwork.

Sir,—The use of the rod as the unit of measurement of brickwork, as also the reduced standard thickness of 1½ bricks, seems to me to be very unwieldy and complicated, particularly after experience in the provinces, where the yard one brick thick is the unit. Can any reader inform me of the reason for this custom and any advantage served by its use?

"Puzzled."

Removing Paint from Brickwork.

Sir,—Can any reader advise me the best and cheapest method of removing several coats of paint from outside brick walls of houses which are to be cement rendered two coats?

H. Taylor.

THE ARCHITECTURE OF HOUSING

On March 13, Mr. Manning Robertson, A.R.I.B.A., lectured at the Architecture Club on this subject.

In the course of his remarks he said the average man, when he heard the word housing, even used apart from the question of slums, conjured up the vision of a dull array of figures; he pictured the inevitable social reformer, he associated housing with endless terraces of monotonous dwellings, and—ran away. This attitude towards the subject was natural, excusable, wrong, and disastrous to the country The chasm that had recently opened between architecture and housing must be bridged They must realise that architecture should be a live present-day art that concerned all building, and, since housing was building in its widest and most universal application, architecture should apply to housing most of all.

Most people believed that architecture was an art that concerned cathedrals, memorials, tombs, and fountains, but how could they reconcile this belief with the charms of their old English towns and villages? Could anyone visit Lewes, Chester, and Bibury without realising that small houses and shops could be as beautiful architecturally within their limitations as any other building? They must face the unpleasant fact that their materialistic commercial outlook had made urban England the ugliest country in the world when the same money spent with vision might have made it the most beautiful. If they wanted to produce really telling arguments in favour of adequate housing they had to say that it was cheaper to spend a little more on housing than to build vast prisons, asylums, and workhouses to deal with the wreckage that their lack of human interest otherwise necessitated.

This might seem rather remote from the subject of the architecture of housing, but it was really the root of the matter. It could be proved that it was quite as cheap to build a cottage of good architectural character as one of the monstrosities to which they were accustomed, but he felt the utter indignity of having to argue as if the beauty or ugliness of their surroundings were worth nothing, and of having to beg that since beauty cost no more than ugliness they might as well avoid ugliness. The increased joy and interest in life thus rendered possible to themselves and to their neighbours should be quite enough to make them decide to bow no more to the god of ugliness.

In regard to the architecture of the small house, the lecturer said he wished strongly to emphasise that there was nothing alarming, nothing terrible, about the elementary principles of architecture, and that everyone could understand them. If the great cathedrals were the symphonies, their cottages and village greens were (or should be) their folk-songs.

The main principles of architectural expression were based on proportion, texture of materials, and colour, including the play of shadows. Their best method of approach was to ask themselves why it was that old English cottage work always succeeded in achieving these principles, and why in the last century they completely failed to achieve any one of them. Was it because industrialism induced an overwhelming interest in money-making, and thus ousted man's natural interest in his surroundings? An old cottage always looked as though it had had care and affection bestowed upon it; the nineteenth-century dwelling represented a house built solely as an investment. They could see at once that the only interest it inspired lay in the money that it represented.

A comparison of the usual suburban house and cottage with eighteenth-century and with better twentieth-century work showed at once how completely the suburban house missed all architectural character. The purely utilitarian house was rarely seen to-day except in the converted Army hut, but the greatest enemy to architecture to-day was the utilitarian house made beautiful at considerable expense—a process that arose because it had been found to pay to add any sort of frippery by the yard in order, if possible, to conceal the loss of all the fundamental qualities of architecture.

The lecturer concluded by urging everyone to take an active interest in the small architecture of to-day. Architecture, he said, should be a subject of common discussion and should not be classed with those technical subjects that concerned nobody but the professor and the student.

The "Municipal Year Book."

The *Municipal Year Book* for 1924 contains information of a very useful character about the various towns from a municipal point of view, such as whether they own the principal public services.

It mentions what has been done in housing since the war, and gives the civic administrator and the names of the departmental officers under whose guidance the town is governed while the laws under which the various classes of authorities work, such as municipal corporations, county councils, urban district councils, rural district councils, Scottish burghs, &c., and the control exercised over them by such Government departments as the Ministry of Health, Ministry of Transport are given.

THE WEEK IN PARLIAMENT

Westminster, *Wednesday.*

The Rents Bill.

The Standing Committee of the House of Commons which considered the Labour Rent Restrictions Bill, on Wednesday, March 19, decided to adjourn for a week in order that representations might be made to the Government to appoint the Attorney-General as a member of the Committee. Members feel that they are completely in the dark as to the Government attitude, and it is contended that the attendance of a law officer is essential.

Housing Policy.

Sir Kingsley Wood asked the Minister of Health when the Government's housing proposals would be presented to the House.

Mr. Greenwood (Parliamentary Secretary to the Ministry of Health) said that good progress was being made with the preparation of these proposals, but he was unable at the moment to state when it would be possible to present them to the House.

Four Years' Figures.

In reply to Sir N. G. Doyle, Mr. Wheatley said that 168,966 houses had been erected under the provisions of the Housing, Town-Planning, &c., Act, 1919. The average all-in cost was estimated at £1,040 per house, and the average rent (excluding rates for all types) for England and Wales was 9s. 8d. per week, or if the Metropolitan area was excluded, 8s. 8d. per week. In addition, 39,184 had been erected with the aid of the subsidy to private builders under the Housing (Additional Powers) Act, 1919; and 3,148 houses had been erected under the Housing, &c., Act, 1923. From the information available he could not say how many houses had been erected for £500 each. The average price for houses included in contracts let by local authorities under the provisions of the Housing, &c., Act. 1923, to the end of January, excluding cost of land development, &c., was £363 for non-parlour type and £418 for parlour type. It was estimated that the loss in respect of 100,000 houses, costing £500 each and let at 9s. per week including rates) might be approximately £1,500,000 per annum for sixty years, which would not necessarily all be borne by the State.

January and February Details.

Mr. Wheatley informed Sir J. Nall that during January authority was given by his Department to housing proposals under the Act of 1923 covering 2,560 houses to be built by local authorities, and 8,119 by private enterprise, a total of 10,679. For February, the corresponding figures were: Local authorities' houses, 3,429; private enterprise, 9,376; total, 12,805.

The £500 House.

Mr. A. M. Samuel asked the Minister of Health if he would state the aggregate total monetary loss over a habitable life of fifty years per house in respect of the 200,000 houses to be built at a cost of £500 each, and to be let at 9s. a week (including rates), such total to allow for interest at five per cent. per annum, sinking fund, provision for repairs and all outgoings, and rates at the present average for the whole country; and if he would state on whom it was proposed that the loss should fall.

Mr. Wheatley said that on the assumptions suggested, it was estimated that the annual loss might amount approximately to £3,500,000 per annum. As regarded the last part of the question he suggested that the hon. member should await the statement which he hoped to be in a position to make shortly on the Government's general housing proposals.

Highest Rents.

Mr. Wheatley informed Mr. E. Brown that the highest rents agreed for "A" and "B" types of houses included in schemes under the Housing and Town-Planning Act, 1919, were 16s. and 15s. 6d. per week in respect of certain houses in the inner London area. The approximate annual deficits on the houses were £40 and £55 per annum respectively.

Evictions.

Mr. Wheatley informed Mr. Hudson that he was considering the introduction of a short Bill suspending temporarily the power of eviction from house property for which payment of rent continued to be made.

Houses in Scotland.

Mr. Adamson (Secretary for Scotland) informed Sir Wm. Sutherland that the total number of new houses erected in Scotland under the post-war Housing Acts was 24,021. The total sum paid or to be paid out of national revenues up to March 31 next in respect of these houses was £2,542,516. Under post-war legislation sanction had been given to schemes which would provide for 2,060 new small holdings and 1,065 enlargements, of which 1,556 new holdings and 782 enlargements had been formed and handed over to settlers. It was estimated that the gross expenditure to be incurred by the State in respect of these 3,125 holders would be approximately £2,600,000.

New Bill.

Mr. Adamson has introduced a Bill to amend the law of Scotland relating to payment by instalments of sums awarded in small debt courts and to the arrestment of wages. The measure permits the payment of arrears of rent by instalments.

Alternative Accommodation.

In answer to questions, Mr. Clynes said that the Government were considering the question of introducing a short Bill to make provision that suitable alternative accommodation should be provided in all cases before eviction orders were granted by the Courts.

Building Trade Negotiations.

Mr. Lumley asked the Minister of Health if he could make any announcement as to the progress of the negotiations with the building trade on the question of the dilution of building labour.

Mr. Wheatley said he hoped to be in a position to make an announcement shortly.

Councillor or Builder.

Mr. Nixon asked the Minister of Health whether his attention had been called to the fact that if a councillor serving on a borough council built houses in the borough for which he was a councillor and received the subsidy he would be disqualified for being a councillor under the Municipal Corporations Act, 1882, and would he take steps to remove this disqualification.

Mr. Wheatley said he was advised that the legal position was as stated, but he could not undertake to introduce legislation for the purpose referred to.

Direct and Indirect Labour.

Mr. Greenwood, in reply to Mr. Baker, said the information available was not yet sufficient to enable a proper comparison to be made between the cost of houses built by direct labour and the cost of houses built by contract. A fair comparison could only be made if all the conditions such as time, place and type of house were precisely similar. So far as final accounts in respect of schemes under the Act of 1919 had been settled up to January 1 of this year, it appeared that the average cost, exclusive of the cost of land and development expenses of 2,662 houses erected by direct labour was £861, and of 47,356 houses erected under lump sum contracts was £915. But in the absence of fuller data he should hesitate to say that any deductions could safely be drawn from these figures.

Weekly Rents.

Mr. Greenwood informed Mr. E. Brown that the remunerative rents (excluding rates) for A and B type houses erected at the average cost for the month of January (as shown by tenders submitted to the Ministry), allowing for cost of land, roads, sewers and management expenses, &c., would be 12s. and 13s. 6d. per week. The addition for local rates depended to some extent on the assessments fixed by the Local Assessment Committees, but might be estimated at half the exclusive rent. The inclusive remunerative rents required would, therefore, be approximately 18s. and £1 0s. 6d. per week respectively.

American Plastering Machine.

Mr. A. M. Samuel asked the Minister of Health whether he was aware that an American company had invented a plastering machine which in one hour performed the work of eight skilled plasterers with six helpers.

Mr. Wheatley said he had not particulars of any machine for successfully executing internal plastering work.

Unoccupied Dwellings.

Mr. Greenwood informed Mr. T. Thomson that statistics were not available as to the number of unoccupied dwelling-houses in England and Wales, but 218,833 structurally separate dwellings were vacant on the night of the 1921 Census. These dwellings, however, were not all necessarily untenanted and included dwellings unoccupied through the temporary absence of the usual occupier.

Continuity of Employment.

Major Moulton asked the Minister of Health whether before he gave any undertaking to the building trade as to continuity of employment on the Government housing scheme the House would be given an opportunity of considering and approving the terms of such undertaking?

Mr. Wheatley said that any undertaking which he might give must of course be subject to the approval of Parliament.

Evictions.

The Prime Minister, replying to a number of questions, said that the alarming increase in applications for eviction orders and notices to quit had nothing whatever to do, he was informed, with the Rent Restriction Bill, but was in consequence of recent legislation changes, the prolongation of bad trade and the great shortage in houses. The Ministry of Health and the Scottish Office had been striving to meet the matter without legislation which at the present moment presented unusual difficulties. A draft Bill was now, however, under consideration.

WAGES IN THE BUILDING TRADE.

A conference between the executive of the National Federation of Building Employers and of the Building Trade Operatives' Federation met at the Young Men's Christian Association recently to consider the demand of the workmen for an advance of 2d. per hour on the basic rate of wages. Mr. A. J. Forsdike presided. The claim was put forward early in February, and was rejected by the employers. It was later referred to a special meeting of the National Wages and Conditions Council, which failed to reach an agreement. The negotiating committee of the men and the representatives of the employers held separate meetings. At the joint meeting it was agreed, after several hours' discussion, that the demand be referred for further consideration by a sub-committee of five members of each side, with the secretaries. After the sitting, Mr. Coppock (the men's secretary), stated: "There has not been a breakdown in negotiations, though at one moment in the discussions we thought it would occur." The meeting for further consideration was held on March 25. Mr. W. H. Nicholls, Chairman of the National Allied Building Trades Employers, presided. At the conclusion of the proceedings both parties declined to say whether a satisfactory decision had been reached, but they will report the result to their respective executive councils. If a deadlock finally results it will be open to the men to give the employers 14 days' notice of their intention to take such action as they may decide upon in order to enforce their demands. Over 700,000 men would be directly affected in the case of a strike.

THE BUILDING TRADE

THE RATING AND VALUATION BILL

Report of the Council of the Surveyors' Institution.

The Council of the Surveyors' Institution has now issued a report on the draft Rating and Valuation Bill, which is deserving of the closest study, as this is the work of a special Committee set up by the Council, composed not only of surveyors practising mainly in rating questions, but also of those engaged in other branches of the profession, including the management of rural and urban estates. In addition to this, the Council circulated copies of the Bill to the County Branches throughout England and Wales, desiring them to place their views before the Special Committee.

The Committee, on November 1, issued an interim report, pointing out that the Bill provided for such long-needed reforms as (*a*) Periodic revision of values throughout the country; and (*b*) all rates and taxes being charged on values appearing in one valuation list, and recommending that these general principles should receive the support of the Institution; and this interim report was approved by the Council. The final report has been since submitted to the Council, and they have now issued a report commenting on the Bill in detail. This report is a very carefully considered document, even suggesting drafting amendments, and we can only indicate the main points suggested in it.

It indicates first in general terms that it is favourable to other general principles embodied in the Bill besides the two mentioned in the interim report, as follows: (*a*) The proposed enlargement of the rating area; (*b*) the consolidation of local rates; (*c*) the formation of fairly extensive valuation areas, with an assessment committee for each valuation area; (*d*) the amendment of current lists during the quinquennium, even where no new works have been carried out nor change of user has taken place; (*e*) the giving of the revenue officer a *locus standi* in connection with the preparation of the valuation lists on the ground that they will also be used for imperial taxation purposes; (*f*) the setting up of a special machinery for dealing with the assessment of railways.

This general approval is, however, qualified as being wholly dependent upon the values appearing in the valuation list being accepted as conclusive for both rating and taxation purposes, and the report states that the Memorandum issued by the Department leaves some doubt whether the subsequent Finance Bill will do this. The report emphasises the point that, unless this is the case, the simplification of procedure and machinery upon which the approval of the Council is based would not be attained, confusion in the minds of rate and tax payers would result, and the great changes proposed would be without justification.

Uniform Assessment.

It is pointed out that the revenue officers could exercise a most useful influence in the direction of uniformity of assessment throughout the country provided that the taxes for which they are responsible were calculated upon the values appearing in the valuation lists, but unless these values were conclusive for that purpose, the incentive would be lessened as there would be an inclination by the revenue officer to deal with differences of opinion between himself and the rating authority by means of additional assessments rather than by negotiation with the rating authority and representations before the Assessment Committee. The principle reason for adopting the proposals in the Bill has been the desire to escape from the complications and reduplications attaching to the existing system, and unless this desideratum is attained the only change necessary as regards valuation and valuation procedure would be the provision for a quinquennial valuation.

The Report recognises that in the event of the valuation lists being made conclusive for valuation purposes, owners who have let their properties for more than the true annual rental would escape taxation on the excess, but it is submitted that the number of these instances would not suffice to counteract the advantages of simplicity and uniformity.

The Revenue Officer.

Although the Report recognises that the revenue officer must be given a recognised *locus standi* in connection with the preparation of valuation lists if they are to be applicable to the dual purpose, the Council is of opinion that the local rating authorities must continue to be the bodies responsible for these local valuations and that apart from railways, which are dealt with in another section of this Report, all classes of property should be valued locally, and it suggests that if the revenue officer's powers were not to exceed those exercised by the inspector of taxes under the Valuation (Metropolis) Act, 1869, there would be no departure from this principle, but the definition of "revenue officer" contained in clause 60 of the Bill is too wide as it might cover members of the staff of the Valuation Office, and the introduction of the official Government valuer for this duty is deprecated. This first part of the Report, which so far we have been referring to, is confined to considering the general principles of the Bill, but this question of Valuers is also dealt with in more detail when the clauses of the Bill are considered separately, and in connection with clause 37 the report, referring to the serious disadvantages of employing the Government valuation staff for purposes other than in support of the revenue officer before the Assessment Committee or in appeals, thus summarises other disadvantages which would ensue if the Government department and not the local authority became responsible for the local valuations.

(*a*) The employment of a Government valuer might be viewed with suspicion by the ratepayers on the ground that he might be influenced (1) by valuations made by him for other purposes and (2) by the desire to meet the requirements of the National Exchequer.

(*b*) A comparatively small number of Government valuers have experience in rating work which is highly specialised in character.

(*c*) If the proposals made in this Report as to the assessment and rating of Government property are approved the Government valuers would necessarily be called upon to value a large amount of Government property for rating purposes and thus be acting in a dual capacity.

This latter objection is founded upon a proposal put forward in this Report that Government property now exempted for rating purposes should be assessed and rated in the same manner as all other hereditaments.

In the detailed portion of the Report it is suggested that members of the valuation staff should not be brought into these matters except as witnesses for the revenue officer on appeal or in support of the officer in laying facts and opinions before the assessment committees.

The Report goes through the Bill in detail and suggests many drafting amendments, but we are compelled to confine our observations to some of the principal points raised.

Gross Estimated Rental.

In the Memorandum issued with the Bill it is stated that the valuation lists are to show the gross and rateable value of each hereditament and that the "gross value" will be the "gross estimated rental" of the past, viz., the annual rent which a tenant might reasonably be expected "taking one year with another, to pay, the landlord bearing the cost of maintenance and the tenant paying the usual tenant's rates and taxes"; and the rateable value will be the operative rateable value, i.e., the actual amount upon which rates other than special rates in rural parishes are to be paid.

The Report points out that the elimination of "gross estimated rental" would tend greatly towards simplification, as in the case of many classes of property the net annual value has to be found in the first instance, the gross being built up afterwards by the addition of allowances in respect of repairs, and it suggests that the old "rateable value" might be called the "net annual value," which would mean the net annual rent which a tenant might reasonably—taking one year with another and with reasonable prospect of a continuance of such tenancy—be expected to pay for a hereditament, he undertaking to pay all tenant's rates and taxes and tithe commutation rent charge, if any, and to bear the cost of repairs, insurances and other expenses necessary to maintain the premises in a state to command that rent. The operative rateable value of the Bill (Clause 16) might then be designated the "rateable value." Schedule A tax, inhabited house duty, land tax, and license duty should be collected on the net annual value as defined above, and there should be no difficulty in adjusting—if and when required—the poundage in the case of taxes and duties now levied on gross value so as to secure a return equal to that at present obtained and to meet the reduction in the values upon which these imposts are now assessed. The report then goes on to say that if the above recommendations are adopted "gross value" will be abolished and there would be no difficulty in arriving *directly* at the net annual value for insertion in the valuation list, and therefore no scale of deductions would be necessary. This appears an important suggestion and it must be remembered that the Central Landowners' Association, in their report (*The Builder*, January 18), took exception to the scheme for fixing deductions from gross values in respect of maintenance.

Rating of Owners.

The present Report, like most of the other Reports we have noticed, takes objection to any extension of the principle of the rating of owners, and contains a detailed criticism of clause 8 of the Bill, which deals with this question. It recognises that it is impossible to collect rates from small weekly dwelling-house property, but it points out that any extension of the system of rating owners, to classes of property not at present within the principle of compounding, is strongly to be deprecated, and it criticises the clause in detail.

Special Properties.

There are some important suggestions as to the valuation of Special Properties, which if carried out would drastically alter the Bill. It is recommended that railways, including docks and canals owned, occupied or worked by railway companies, should be valued by a central authority, but that that authority should be elected, save as to the chairman, by the assessment committees of England and Wales from members of their own bodies, and that authority should be designated "The Railway Assessment Committee." The indirectly productive works such as stations, sidings, &c., should be valued locally by the rating authorities, under the direction and control of this Railway Assessment Committee. All other special properties should be valued locally by the assessment committees, joint committees being formed to deal with properties extending into more than one area.

The Report objects to the question as to what are to be deemed "special properties" being left to be determined by the Minister and, rightly in our opinion, considers that they should be defined in the Bill, and the following definition is proposed: "Hereditaments comprised in the undertakings of tram, gas, water, electric light

nd power, and hydraulic power undertakings, nd in those of docks and canals other than those wned, occupied or worked by railway com- panies." Any question as to what is a special roperty to be settled by the Railway Assess- nent Committee, whose decision should be final. n connection with this subject it is suggested hat a special tribunal of appeal should be stablished to deal with appeals in respect of pecial properties.

This is only a brief survey of some of the uggestions contained in this Report, which ppears the most comprehensive yet issued. t will prove a difficult task to collate the arious reports and extract the best solution rom the opinions offered. So far it appears hat the majority of opinion does not reject he principle of a single valuation for rates and axes, but that there is a consensus of opinion hat serious modifications must be made in the Bill as to the methods by which this should be ut in practice.

SHORTAGE OF TIMBER

Mr. R. L. Robinson (Forestry Commissioner) ectured recently before the Society of Arts on his subject. Lord Clinton presided. During the ourse of his remarks, Mr. Robinson said the otal extent of the North American forest was ,500 million acres, of which 770 million was n Canada and Newfoundland, 550 million in the Jnited States, 70 to 150 million in Alaska, and 4 million in Mexico. It would appear, said the ecturer, from those figures that the area of orest in North America was about double that f Europe, but from the point of view of timber upply great deductions had to be made from the otal. The area of effective forest was estimated t 750 million acres. In addition to the wood emoved for use enormous quantities were de- troyed annually by fire and by the ravages of nsects and fungi. Estimates had been made of he quantity of timber removed from the forests by all agencies, and the latest figures indicated hat the total volume was in the neighbourhood of 32 thousand million cubic ft. annually. On his basis, if there were no growth at all, and all he forest was accessible, it would all be used up n, approximately, thirty-five years. Very ittle had been done to replace the destruction. Natural regeneration to be successful required egulating, in order that the most useful species night be secured. As a rule some assistance n the form of planting was necessary. Those were the first stages in systematic sylviculture, nd so far had received very little attention; he area which was being planted in North America averaged under forty thousand acres; t was not double the amount in Great Britain. t seemed clear there must be considerable tringency in the supply of forest products in North America within the next twenty or thirty ears. The continent would absorb all the orest products it could grow, and the eastern states of the Union might even become com- petitors with the United Kingdom and Western Europe for the soft woods of Northern Europe. This might become a serious matter for the Jnited Kingdom since the present exportable nargin for Northern Europe was not capable f very great expansion. In regard to hardwoods, o doubt increasing demands would be made on ropical forests.

In the discussion that followed, Lord Clinton aid it was important for them to form some eal idea of what was to be done when the ountries from which they now obtained their mber required their whole production for heir own use. The softwood supply was a atter of great difficulty, but he was not sure iat the hardwood supply would not be a matter even greater difficulty. In regard to native ik they were working on timber planted a ndred years ago and more; little or no anting had been done for the last seventy ears.

Mr. G. R. Courthope, M.P., said in a few ears they must not expect to get any timber all from North America. In Europe the rate consumption of softwood timber exceeded e rate of production by something like 3½ ousand million cubic ft. a year, and at that rate there would be nothing left in about seventy years. Most of them would live to see the time when commercial softwoods would not only become very expensive but would be almost unobtainable, because directly exporting countries realised the danger of the present rate of exhaustion, they would place restrictions on export.

TRIBUNAL OF APPEAL

On March 25, at the Surveyors' Institution, 12, Great George-street, Westminster, the Tribunal of Appeal under the London Building Act, 1894, heard an appeal made on behalf of the North British & Mercantile Insurance Co., Ltd., against the refusal of the London County Council, dated the 9th day of February, 1924, of an application for rebuilding at Nos. 61 and 62, Threadneedle-street, City, to a greater height than that provided by Section 47 of the said Act.

Mr. C. Henderson, K.C., appeared for the British Mercantile Insurance Co., and Mr. Dimes for the London County Council.

Mr. Dimes, for the L.C.C., said, in order not to waste the time of the Tribunal he had a preliminary objection to the hearing of the appeal; it had not been lodged within the proper time.

Mr. Henderson, for the British Mercantile Insurance Co., said the appeal was lodged within 21 days of February 9, and was, therefore, in order. An application was made on behalf of the Insurance Company on October 12 last, as follows: "Our clients are reconstructing the greater part of their premises, and we are instructed to apply for permission to rebuild; the height of the building being the same as the proposed new Post Office." On November 17 the Council gave their decision as follows: "With reference to your application, I have to inform you that the Council has refused to permit the addition at 61 and 62, Threadneedle-street, as it is undesirable." However, at an interview on December 18, Mr. Thompson saw the Superintendent Architect, and showed him the original drawing of the proposed façade. In a letter, however, the Council stated they were not prepared to vary their decision. On January 8 Messrs. Thompson & Walford had a telephone message from the Superintendent Architect asking them to attend before a meeting of the Building Committee to be held on January 14. On this date they attended before the Building Committee and explained the needs of the Company, and the reason for their application for the extra height of building. At that meeting Mr. Taylor made a suggestion that the front wall should be lowered to 80 ft., with the upper part of the sixth floor incorporated into the roof under the seventh and eighth floors. After a further application from Messrs. Thompson & Walford that the original design be approved, the Council wrote saying that they were not prepared to alter Sections 175 and 178 of the London Building Acts. On February 14 Messrs. Thompson & Walford wrote saying that they could not consider the decision of the Council irrevocable, as the increased height had been allowed to the Post Office; and that the Council had already given consent on other occasions for the erection of buildings of a higher nature. The Post Office, Mr. Henderson said, were not required to submit plans, but as a matter of courtesy they did so, and the Council said they had no observation to make at all. Mr. Henderson submitted if on November 17 the final refusal was made by the Council, the only remedy for the Company would have been to come to the Tribunal at once. It was difficult to see why further correspondence should have been received from the Council. He contended there had never been a suggestion from the Council that they had finished with the matter; but at the interview on January 14 a suggestion had been made that the plans might be modified. As the Council had carried on negotiations he could not understand why a technical objection on the point of appeal should be made. He maintained that the Council did not finally conclude the matter until February 9.

The President said he outlined the position of Mr. Henderson as follows: (1) The Council could reconsider a decision; (2) fresh facts had been put before the Committee; (3) appellants had been brought into their position by the action of the Council themselves.

Mr. Henderson said it was not his position that the Council had consistently refused his petition, but that the Company had put fresh facts before the Committee; therefore the matter was not closed.

Mr. Dimes, for the L.C.C., said the suggestion made to Mr. Thompson was that he should modify his building in order to do without the Council's consent. If the parapet were 100 ft. high, it contravened the Act; but Mr. Taylor suggested if the parapet wall were stepped back behind an angle of 75 deg. in the roof, two stories could be built without contravention of the law.

All the Council had had were amplifications of the original scheme. If, when the Council made a suggestion in order to help an application, it were construed as a fresh decision, it would upset the basis of all negotiations.

The Tribunal allowed the preliminary objection of Mr. Dimes to the appeal.

BOOKS

Specification: For Architects, Surveyors, Engineers, &c. Edited by Frederick Chatterton, F.R.I.B.A. No. 26. 1924. (The Architectural Press, London, S.W. 1.)

This massive volume well sustains its reputation. It is quite unique amongst technical works relating to building matters, and the publishers can rightly claim—as they do on the title page—that "Specification is as necessary to the architect as an encyclopædia is to the man of letters." Within its covers is found a mass of information which is not to be found in any other one volume. Wherever we have been able to test it the information given is thoroughly reliable. Travellers are not always welcome in architects' offices. At the same time it is absolutely necessary for the modern architect, to keep up with modern methods of construction, and here will be found such particulars as will enable him to form a judgment as to their merits and suitability for any special class of work.

The special articles referring to hotels, half-timber construction, timber roofs and the Housing Acts are well worthy of study and include some interesting drawings and photographs of ancient and modern examples. Folding plates of brickwork, tiling and joinery add to the value of the work.

Effect of the Shape and Surroundings of a Hot Surface on the Radiation from it. By A. H. Barker and M. Kinoshita. (University College, London.) Bulletin No. 1, 1923.

This report is in part a résumé of Mr. Kinoshita's earlier paper on "The mathematical theory of heat exchanges, as applicable to practical work," and is published with the financial help of the Institution of Heating Engineers and the Industrial Research Department. The authors deal first with primary emission and absorption, and give a useful table of emission co-efficients for different materials, and the net energy gained and lost by a body due to heat transference is discussed. Mathematical reasoning is applied to various examples, such as the determination of the amount of heat received by different bounding surfaces in a room possessing a radiator. Interesting data on the comparative efficiency of column radiators of different types are given.

The last half of the work—some thirty pages—deals in an appendix with the distribution of emitted and absorbed heat over a surface of uniform temperature. This research is of an advanced and mathematical character, and beyond the scope of the layman, but should be of value and interest to the heating engineer and designer who wish to gain a fuller insight into the difficult problems of efficient heating apparatus.

EDUCATION IN HEATING AND VENTILATING INDUSTRY

In the course of their report the Education Committee of the National Joint Industrial Council of Heating and Domestic Engineers state that the education movement originated from, and was rendered necessary by, the scheme instituted by the National Joint Industrial Council for training heating and domestic engineer apprentices, according to the following specimen indenture :—

"And they further covenant with the employers that the said apprentice will, during his term of apprenticeship, regularly attend the classes for technical instruction where practicable, and diligently study the subjects that are applicable to his trade, and will present himself for examination at all such examinations held in connection therewith as students are required, or expected, to attend, and that he will satisfy his employers as to the subjects taken and to his regular attendance and study thereat, and the said employers shall provide all necessary fees required for the said classes."

At a Council meeting, held on January 8, 1920, it was remarked there were no courses of classes in being, and the Council resolved in the first instance to form local education committees, and, after investigation, the following centres were decided upon: London, Manchester, Birmingham, Leicester, Liverpool, Sheffield, Newcastle-on-Tyne, Bristol, Norwich, Brighton, and Nottingham.

Careful consideration was given to the curriculum to be adopted, which was so arranged that tuition should be a continuance of the education already attained by the prospective student, satisfy the requirements of the industry, and be adaptable to the existing arrangement of classes held in evening technical schools provided by the Board of Education. The Committee adopted for the first four years' training the junior and senior courses (two years each) of engineering set out by the Board of Education, which met the required conditions and were provided by almost every polytechnic, technical or science school throughout the country that included engineering as part of their ordinary curriculum. The Committee devised and adopted a final two year specialised course in heating, ventilating and domestic engineering, and building construction drawing, to meet the particular requirements of the industry.

The Committee prepared and issued a booklet, entitled "Advice to Intending Students as to Courses of Study," a copy of which can be had on application to the Secretary (price, 2s.). Mr. J. Scholes Hague, M.Sc., Principal of the Municipal Technical Schools, Liverpool, in the course of a letter expressed his interest and appreciation.

The Local Education Committees experienced many difficulties, the principal being: The small number of apprentices to enrol, apprenticeship not being a general custom of the trade; the variety of ages from fourteen to forty-five years of students wishing to enrol; the small number of students of all ages who had acquired any previous technical education; the dropping off of attendances at the classes during the session from waning or lack of interest or want of comprehension; and dropping off of attendances through the student being absent from home on country jobs.

The Committee later, at a conference, passed unanimously the following resolution: "That an endeavour be made to encourage technical education in day schools one day each week for apprentices up to eighteen years of age, and that employers be approached with the object of keeping students up to eighteen years of age in their respective towns during the winter months."

They are pleased to report that this resolution has been approved and confirmed by the Council of the Employers' Association and circulated to its members.

In conclusion, the Committee state it has laid the foundation stones of the technical education movement, and that the success and extension of the movement will largely depend upon the result of the work done in the various centres, which, in turn, devolves upon the encouragement, careful teaching and nursing by the Council, the Committee, the Local Education Committees, their Secretaries, and others, who may be interested.

THE RENT ACT: RENT BELOW STANDARD RENT

In the recent case Dufty *v.* Palmer, very briefly reported in *The Times*, March 14, an important point has for the first time been directly raised under the Rent Act, 1920. That point is whether where premises have been let at a rent less than the standard rent the landlord can, notice to quit having first been given, increase the rent up to the standard rent. Incidentally, it also raised the question on what basis the permitted increases should be made. The plaintiff was the landlord of certain premises the standard rent of which in August, 1914, was £68 per annum. In 1918 these premises had been let to the defendant at £40 per annum, and in January, 1922, the landlord had given notice to terminate the tenancy on July 25, and thereafter to increase the rent to £68, the standard rent. In September of the same year notices were served of increases under the Act and this action was brought to recover the rent and the increases made upon it.

It came before a Divisional Court on appeal from the County Court, where judgment had been given for the defendant, the tenant. The Divisional Court held there was nothing in the Act which authorised in addition to the increases specified in section 2, the increasing of an agreed rent to a higher standard rent. The intention of the Act was to give fixity of tenure, and payment of the agreed rent was a term of the original contract of tenancy which was consistent with the provisions of the Act. It was held that the plaintiff was entitled to 13 months' rent at £40 a year and the permitted increases in rent which, however, must be based on the standard rent of £68 per annum.

The point appears a difficult one and it has never been directly decided before, although it was raised in the case Glossop *v.* Ashley (1922, 1 K.B. 1), which will be found noted in the Court of first instance in *The Builder*, April 15, 1921, but was subsequently carried to the Court of Appeal. In that case the tenant had been in occupation of the premises since or before August, 1914, but there had been variations in the rent as the house was a "tied" public house and at one time since 1914 the rent had been lower than the rent on August 3, 1914. It was held both in the Court below as well as in the Court of Appeal, that as the tenant had been in occupation continuously since August, 1914, (which distinguishes that case from the case we are considering), the rent he then paid was the standard rent, but in the course of the case it was raised as a query whether where a tenant is paying less than the standard rent the landlord could without the tenant's assent raise the rent to the standard rent. Mr. Justice McCardie intimated that there was nothing in the Rent Act to prevent the landlord so doing. In the Court of Appeal Lord Justice Bankes left this point open; Lord Justice Scrutton thought the rent could be so increased, whilst Lord Justice Atkin was of the contrary opinion.

The Divisional Court has now decided the point, as it arose directly in the case under consideration, and from the short report of the case the judgment appears to have been founded upon the argument that there is nothing in the Act to authorise any addition to the increases permitted by section 2 and by a reference to section 15, which enables a tenant to retain possession on condition that he observes the terms and conditions of the tenancy agreement, but the Act is certainly not clearly drafted on this point, for if the question be put in another way, what is there to prevent such an increase, it seems difficult to answer.

Section 1 only restricts increases in rent which exceed by more than the permitted increases the *standard rent*, and the amount of such excess is made irrecovable from the tenant, and by section 14 it is only such excess that can be recovered by the tenant. Section 15 is to apply only so far as the terms and conditions of the tenancy are "consistent with the provisions of the Act," therefore it is difficult to see any provision which brings an increase only up to the standard rent and not above it within the machinery or provisions of the Act.

The nearest approach the Act makes to this point perhaps is contained in section 12, subsection (1) a. which deals with progressive rents under an agreement and makes the maximum rent payable under such agreement the standard rent, but provides that where at the date by reference to which the standard rent is calculated the rent was less than the rateable value, the rateable value at that date shall be the standard rent.

The point raised in this case should at any rate have been dealt with in this subsection of the Act. It has, however, now been definitely decided by a Divisional Court and the case provides one more instance of the difficulty of legislating on such a subject as rent restriction.

Building Industry.

At a recent meeting of the Darlington Rotary Club Mr. J. J. Blackett gave an address on "Getting Back to Pre-War Conditions in the Building Industry."

Mr. Blackett expressed the opinion that building was the greatest of all industries, as the happiness and comfort of the nation depended upon it. It dated back to the days of the Babylonians. The Romans introduced it into this country, and many of their buildings were still standing. The industry was first organised in this country by Sir Christopher Wren and his colleagues. The advent of cement, steel and electricity had done much to rob the industry of its craftsmanship. Pre-war domestic work in this country was often termed "jerry" building, but it was much better than a great deal of the work done under Dr. Addison's scheme a few years ago. Under that scheme every Tom, Dick and Harry who had the least idea of building was received with open arms, and the result was disastrous to the industry. It was a God-send when the Ministry of Health called a halt, for now they were slowly getting back to pre-war methods.

Fleetwood Builders' Association.

The Fleetwood, Poulton, Thornton and District Building Trades Employers' Association held their annual dinner recently at the North Euston Hotel, Fleetwood. The newly-elected President, Councillor C. H. Riley, said they all felt proud of the elevation of their retiring President to that of President of the North Western Federation, one of the best organised Federations in the world. The Federation has 70 local associations, with a membership of 3,500.

Mr. R. Leach, responding for the North Western Federation, said they were met together with a cloud hanging over them. At the present time they were having difficulties with the operatives, who demanded an increase of 2d. per hour over the present rate of wages. The employers were convinced the wages were quite high enough, and intended to resist the claim. The operatives, who were taking advantage of the shortage of labour in the building industry. In regard to the question of the shortage of houses, he considered it was the result of the high cost of materials, coupled with the shortage of labour in some of the crafts of the building trade, and if wages were increased at the present time it would seriously retard the progress of building. The Government were endeavouring to erect houses for the working men, but until the Government decided to take into their counsel the employers, operatives, and architects, it would be a long time before they obtained the number of houses they required.

Mr. S. Wigham, speaking on the demand for increased wages, expressed the hope that the Association and the rest of the associations in the area would follow the policy laid down by the leaders, whatever it might be.

HE TREATMENT OF THE DEATH-WATCH BEETLE IN TIMBER ROOFS

Ir. H. Maxwell-Lefroy, M.A. (Professor of tomology, Imperial College of Science and hnology), recently read a paper before the yal Society of Arts on this subject.

n the course of his remarks, he said during last ten years it had been realised that the st, actual or future attacks of the death-watch tle on all structural timber were of real portance, and if they were to hand on to er generations the fine timber constructions he past four or five centuries some definite ps must be taken to deal with this insect. He thought all who had been concerned with care of old timber roofs knew that the nage might be extremely serious, and so ch was common knowledge on this point t he need not stress it; but there were three nts which needed special consideration: w did the roof become infested? Why did attack stop? How could they recognise attack deep in an inaccessible structure?

The way in which an attack commenced was great interest, and he offered them three jectures; they were:—

1) That the original timbers were infested en put in place;

2) That at any time after construction the ect was brought in with renewals, repairs, resh timber objects, such as floors, pews, &c.;

3) The insect itself came in.

They had, unfortunately, no knowledge of third; beetles did fly and might come o buildings, but it was unlikely and ill orded with what they knew of the beetle's bits. All the cases he had seen had pointed the use of originally infested wood, or the roduction at some time of infested wood for pairs, renewals, church furniture, flooring, or e like.

The next point was why an attack ceased; undoubtedly did cease without reference finitely to anything that had been done to op it; these cases showed an abundance attack (which one could date, for instance, th reference to definite emergences of beetles rough a layer of lime wash put on at a known te), abundant further timber to attack, and evidence of actual attack at the present date. hat had happened? Had the beetles come t, flown away, and gone elsewhere? Had the ibs perished inside? Had the wood become o dry, or had the yeast perished? They did t know, but they must take account of the enomenon. A great sum of money had en spent on buildings in which all attack had ased; and cases were under observation now here the assumption was that no further tack was proceeding, and the risk was being finitely taken of doing nothing at present to al with the pest, merely on these grounds.

There were two sources of evidence that the tack was in progress in timbers; one was the oles in the wood from which the beetles had merged, and which were unmistakable; the her was the absolutely characteristic oval ttened pellets of excreta, which might pour t of a big roof joist, and which indubitably oved the presence at some time of the beetle.

TREATMENT.

Prevention of Infection.

The first and most obvious protection was to ake sure that nothing was brought into a ilding that would bring in the insect, whether be worked or unworked timber to be used for newal or repair, or it be wood furniture or oring. There was, unfortunately, evidence at quite ancient roofs, not hitherto infected, d been infected in this way.

Surface Treatment.

They then came to treatment of wood *in situ*, here it was possible to get at nearly all or solutely all surfaces, and where any damage ing on could be located, minimised or stopped by a surface treatment. This meant that if an attack were going on, the beetles either could not get out or could not get in to a fresh surface.

He knew of no other treatment but a chemical one: one could not heat timbers to 130 deg. F. when *in situ*; one could not, as a rule, use a vapour or any electrical action; and they knew so little of the beetle they had no way of enticing it out.

The ideal surface treatment should have these properties:—(1) Penetration, due to wetting power (*i.e.*, to low surface tension in regard to the interfacial action of liquid and wood); this meant only that the liquid would wet evenly all cracks, shakes, crevices, &c., not that it would actually penetrate across the grain into the wood itself. (2) Killing power on eggs or grubs at the surface. (3) A permanent poison to emerging beetles. (4) Deterrent to wandering beetles seeking shelter or a place to lay eggs. (5) Permanent, not chemically changing or altering in colour in course of time. (6) Reasonably non-inflammable. (7) Not a virulent poison to man while in application. (8) Not a permanent virulent poison which could, for instance, come off choir stalls or lecterns on to moist fingers—corrosive sublimate was a case in point which had been used in this way. (9) Not be a varnish solvent for cases where varnished or polished wood was concerned. (10) Comparatively simple and cheap. (11) Not too odorous. (12) Give off a vapour toxic to insects inside the wood. (13) Not corrosive to metal used in strengthening or bolting up. (14) Applicable as a liquid, as a spray, swab or cream. (15) Not form a dust on drying which would eventually dust out. (16) Not affect the colour of the wood.

Very stable and permanent soaps, which were non-poisonous, had been made with metallic elements, such as barium, zinc, &c., which could also be emulsified with paraffin wax and other ingredients in water as a medium; it was cheaper to use water to the extent, say, of 80 to 85 per cent., if it would carry paraffin wax, a metal soap and a deterrent oil. A typical formula which he suggested was as follows:—Zinc, or barium oleate, 3; cedar wood oil, 3; soap, 1; paraffin wax, 10; water, 83. This was applied liquid to surfaces with a brush or spraying machine; it left a film of the wax, soap and metallic oleate, invisible, not affecting colour or varnish, not dusting out, not a human poison. Where colour was immaterial one might use a copper oleate; one could also add a volatile poison, such as dichlorbenzene.

A mixture used in some buildings had been linseed oil and turpentine; this was an excellent temporary local application, the turpentine driving the insect in, but beetles came freely through it when the turpentine had gone.

Internal Treatment.

Cases did arise where one might have to work on a roof *in situ* where all principal timbers were to be left undisturbed, yet where there were believed to be colonies of insects at work deep inside. His suggestion was that one could cautiously penetrate into infested wood with a $\frac{3}{8}$ in. augur, screw in a pipe, and pump in a liquid which would do three things: it would give off a poisonous vapour, penetrating the burrow systems and killing larvæ; it would leave a permanent poisonous deposit against future attack; it would strengthen badly decayed wood.

The second point was to prevent re-infection, and one could use a wide range of poisonous substance inside wood, particularly if colour were immaterial; one would use creosote but for its smell and its lack of permanency; but he thought some form of the mineral soap such as copper, barium or zinc oleate was the best.

Thirdly, could one put in a liquid that would strengthen the much decayed timber and still carry a poison and disseminate a vapour? The simplest suggestions were cellulose acetate, synthetic resins, fluosilicates, hard waxes, and silicon ester.

Ventilation.

A last point of general treatment was one that was impossible to prove experimentally without abundant time, but frequent observation impressed it on one; it was the enormous influence of ventilation; wood that was kept well ventilated, even if attacked, would not ultimately perish. In two prominent buildings in London, of about the same date, one was attacked at the base of the principal rafters only, where they ran into the walls; the other had been attacked, but the attack had ceased, the whole timber structure being remarkably ventilated. He thought that this point was continually coming up, and observation did correlate ventilation and immunity in a decisive way. Perhaps insufficient attention had been paid to this point, and perhaps there might have been cases where it would have been a sound policy to improve ventilation, to watch at intervals for evidence of attack, and to exercise patience before actually dealing structurally with a roof or floor; when an insect reproduced only at two or three year intervals, it took a long time for an attack to develop, and one could afford, perhaps, to wait awhile and see whether improved ventilation alone would not prevent serious extension of damage.

NEW BUILDINGS IN LONDON

Coventry-street.— Alterations.— Structural alterations and redecoration will shortly take place at the Elysee Restaurant, Coventry-street. These premises are to be turned into a cabaret. Mr. Bertie Crewe is the architect.

Queen Anne's-gate.—Redecorations.—Further to the list of sub-contractors employed in the redecoration of No. 26, Queen Anne's gate, given in our last issue, Messrs. Thomas Faldo & Co., Ltd., are responsible for the asphalte work.

East Sheen.—Houses.—The plans are now being prepared for the second group of houses on the Barker estate. The architect of the estate is Mr. S. E. Castle, of 40, Albemarle-street, W.1. Messrs. C. & E. Melville, of East Sheen, are the agents dealing with the disposal of these houses, which will be of the three or four bedroom type, with two sitting rooms and the usual offices on the ground floor.

Builder's Estate.

Mr. Francis Read, of Royland-road, Loughborough, Leicestershire, builder (net personalty, £8,374), £10,183.

Wages on Public Works.

The Public Works Conciliation Board has fixed the award, dated March 21, for the London Area, namely: The City and County of London and the whole of the districts of all the local authorities the whole or any part of whose district lies within the Metropolitan Police district.

The award fixes the rate of wages to be effective for the three months, April, May and June, as follows:—Blacksmith, 1s. 8d.; Concrete Leveller, 1s. 3½d.; Duct or Earthenware Drain Layer, 1s. 4½d.; Fitter, 1s. 8d.; Granite Mason Kerb, &c., 1s. 9d.; Granite Sett Dresser, 1s. 8d.; Jointer, 1s. 4½d.; Kerb Fixer, 1s. 8d.; Pavior, 1s. 8d.; Petrol Locomotive, Petrol Roller, or Petrol Air Compressor Plant Driver, 1s. 5½d.; Pipe Jointer (iron up to 6 in.), earthenware or concrete pipes and conduits, 1s. 4½d.; Pipe Jointer (iron) above 6 in. diameter, 1s. 5½d.; Platelayer, 1s. 4½d. to 1s. 5½d.; Platelayer Labourer, 1s. 3½d.; Pneumatic Pick Operator, 1s. 4½d.; Rammerman, 1s. 4½d.; Scaffolder, 1s. 6½d.; Screeder, 1s. 4½d.; Steam Roller Driver, 1s. 7½d.; Street Mason and Flag Dresser, 1s. 8d.; Tarpot Man, 1s. 3½d.; Timberman, 1s. 4½d.; Wood Block Layer, 1s. 4½d.; Men working in "boots," 1d. per hour extra; Watchman, 7s. 6d. per shift minimum day or night. The hours of labour and overtime rates remain as before.

INSTITUTE OF CARPENTERS

ON March 22 the British Institute of Certified Carpenters held their annual dinner at Pritchard's Restaurant. Sir Frederick G. Rice presided.

After the loyal toasts had been honoured, MRS. BACK proposed "The Institute," coupled with the Hon. Secretary (Mr. G. T. Preston).

MR. G. T. PRESTON, responding, said their numbers were increasing, although they were bound to be limited as only about 70 men qualified annually. However, of these the Institute had about 30 as members. He hoped the time would come when architects would say, "Is this man a member of the British Institute of Certified Carpenters?"

MR. W. COX, proposing "The Worshipful Company of Carpenters," said it dated from the time of Edward IV—about the fifteenth century. In the old time there was need for some protection of the craft of carpentering; also to ensure that proper work was done. The Company had not only powers of search which enabled them to find out whether the material was of the right quality, but also they had the power to see that the work was done in a proper way. In the 'seventies certain of the old Guilds began to doubt whether they were necessary: the Carpenters' Company came out unscathed. He wished to emphasise that the Worshipful Company gave particular encouragement to the Institute. The time would come, perhaps, when their qualified men would have the privilege of joining the Worshipful Company. As craftsmen they should be enabled to make their own laws as to what had to be done.

SIR FREDERICK RICE, responding, in the absence of Mr. H. Blackborow, said among the members of the Worshipful Company were many men who had served in the joiners' shops. The Worshipful Company was always pleased to recognise the work of the Institute, and to do what they could for their interests.

MR. H. E. GIBBS, V.P., then proposed "The Ladies," to which LADY RICE responded.

MR. GEORGE AYRES, V.P., proposing "The Chairman," said Sir Frederick had been a member and vice-chairman of a Commission to consider lead poisoning; also chairman of the Moratorium Committee. He had also, when examiner in carpentering, suggested to the Institute of Builders that it would be a wise thing to provide prizes for practical work. Mr. Ayres then referred to the fine examples of oak at the Metropolitan Water Board, a building erected by Sir Frederick's firm.

SIR FREDERICK RICE, responding, said in regard to prizes the Institute of Builders had eagerly fallen in with his suggestion; also that prizes should be given to other trades. He had high regard and esteem for the work of the Institute of Carpenters, and hoped they would have many members pass through their examinations, which, he was glad to say, they insisted on: it kept up the high status of the Institute. In regard to the Metropolitan Water Board Offices, the oak was removed from the old oak room that had existed for some 300 years, and consisted of a new oak room with an old ceiling and old panelling. It was original Grinling Gibbons carving. Continuing, Sir Frederick said it was due to the Institute of Carpenters that they should be represented in the House of Commons; it was one reason why he had put up for Parliament. If successful in the future, it would be his desire and pleasure to regard the work of the Institute with special care; he would consider it a privilege to safeguard the interests of the carpentering trade.

Mr. C. Gordon Huntley, A.M.I.E.E., M.I.H.V.E., has relinquished his connection with the consulting engineering practice of Messrs. Huntley & Wood, and has joined the echnical staff at the London office of Messrs. Davidson & Co., Ltd., Central House, Kingsway, W.C.2.

RATES OF WAGES IN THE BUILDING TRAD

The following are the rates of wages in the building trade in England and Wales. E endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur

	Masons.	Brick-layers.	C'p'ters. Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers.

Change of Name.

The name of the Thames Paper Co., Ltd., has been changed to Thames Board Mills, Ltd. The change is one in name only, and does not involve any alteration whatever in the directorate, management, or personnel. They consider that as the company does not manufacture paper proper, the title is something of a misnomer, that the new name would be more appropriate, and would more clearly describe their operations, which are, briefly, the manufacture of fibre boards for various purposes, including "SX" board for constructional work.

Messrs. Ruston & Hornby, Ltd., inform us that, owing to the expansion of business passing through their City office, they have found it necessary to change their London address. On and after March 31 it will be: Imperial House, 15–17–19, Kingsway, London, W.C. 2.

PROPOSED NEW BUILDINGS & OTHER WORKS *

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ABRAM.—Further tenders were opened and considered for the erection of a mortuary. The surveyor is to prepare estimates for carrying out the work.

ANNFIELD PLAIN.—The U.D.C. have adopted a recommendation of their H.C. that 56 houses be erected on land owned by the Council at Catchgate.

ATHERTON.—A Manchester civil aviation company has been granted a twelve months' licence by the Air Ministry for an aerodrome to be situated off Bee Fold-lane, Atherton.

AXMINSTER.—The M.H. has approved the housing scheme for Colyton of the R.D.C., and sanctioned the borrowing of £1,500 for granting subsidies under the Housing Act.

BARNSLEY.—The Governors of the Beckett Hospital and Dispensary have decided to proceed with an extension scheme, comprising a new block containing wards for women and children, at an estimated cost of £12,000.

BILLINGE.—The Surveyor recommended that the new main sanctioned by the Ministry some time ago be laid to Summit, and that 6 in. cast-iron pipes be used. He also recommended a new 5 in. main from this point to Mount Pleasant, estimates of the cost were accepted. It was resolved that tenders for the material required should be advertised for.

BISHOP'S STORTFORD.—Plans passed by U.D.C.: Bungalow, Warwick-road, for Mr. F. Markwell.

BLAYDON.—The U.D.C. have decided to seek sanction to lay out the whole of the Bleach Green Estate, showing 300 houses.——The Consett Iron Co., Ltd., submitted plans for 60 houses they propose to erect at High Spen.

BOGNOR.—Plans passed by U.D.C.: House, Marshall-avenue, for Mrs. L. C. Baldwin; house, Victoria-drive, for Mrs. A. C. Jenkins; shop and dairy, High-street, for A. Kuhn; six houses, Linden-avenue, for A. A. W. Tribe; cottage, Cavendish-road, for Mrs. Fairfax; two houses, Green-lane, for B. Geall; house, Chichester-road, for W. R. Metcalfe; house, Linden-avenue, for Mr. Martin; bungalow, Nyewood-lane, for Mrs. E. Pedder; two houses, Parklands-avenue, for P. N. Gibbs.

BOLTON.—The trustees of the Foundry-street Mission are proposing to rebuild their Mission hall at an estimated cost of £1,200, towards which funds are being raised.

BO'NESS.—The T.C. has acquired the Clydesdale Hotel for the purposes of conversion into municipal offices.

BRADFORD.—An inquiry has been held by Mr. M. G. Weekes into the Corporation's application for sanction to borrow £29,795 for works of sewage, including the construction of an inverted syphon across the Aire Valley, in connection with the Esholt Works.

BRECONSHIRE.—The Builth R.D.C., in conjunction with the Tregaron R.D.C., has applied for grant toward cost of erecting a proposed new bridge at Nantstalwen.

BRIDGEND.—Plans passed by the U.D.C. are as follows:—Two houses, Brynteg, for Mr. G. Jones; two houses, Brynteg, for Messrs. Hawkins & Thompson; bungalow, Suffolk-street, for Mr. Taunton; two houses, for Mr. E. Clarke.

BRIGHOUSE.—Plans passed by T.C.:—Hargreaves, Longroyd-road, Calder & Hebble Navigation, house, Brighouse Wharf; W. D. Earnshaw, bungalow, Bracken-road West; Trustees of Chas. H. Macaulay, new street, Slead Hall Estate.

BURY.—The Sewering, Paving and Streets Committee have approved plans for 16 more houses in various parts. For the purpose of carrying out extensions and alterations at the Rochdale-road substation, application is being made to borrow £5,000.

CALLINGTON (CORNWALL).—The U.D.C. passed plans for eight houses.

CARLISLE.—Plans passed by R.D.C.: Misses A. and M. Little, of Watch Cross, near Crosby-on-Eden, for two cottages at High Crosby; Mr. M. Cowan, of Grinsdale, on behalf of the Building Committee, for the erection of a public building at the village of Grinsdale.

CARMARTHENSHIRE.—The Carmarthen and Llandilo R.D.C.s have decided to erect a joint girder bridge at Panteg.——The St. Clears-Langharne road is to be reconstructed at an estimated cost of £12,200 by the C.C. Grant of £9,150 has been promised by M.T. toward the cost.—— The Landovery T.C. has granted land to the Cottage Hospital Governors for erection of a new hospital.

CHESTERFIELD.—It has been decided to construct a new ward at the Royal Hospital.

CLITHEROE.—The T.C. has approved a plan for the widening of Lowergate and application is to be made to the M.T. for a grant towards the cost of the work. Plans for the erection of three pairs of villas in Pimlico and Waddington roads were approved.

CLOWNE.—Plans passed by R.D.C.: House, Boughton-lane, for Mr. H. Rayworth; pavilion at Miners' Welfare, Barlboro'; two houses, Elmton-road, Creswell, for Mr. T. Ducker; bungalow, Elmton-road, Creswell, for Mr. J. Shakespeare; 11 houses, Brookhill, for Mr. F. J. Hutchings.

COVENTRY.—The B.G. has consented to an expenditure of £1,500 for the erection of a children's ward at the Infirmary.

CUDWORTH.—The U.D.C. is applying for sanction to borrow £13,200 for the erection of 34 houses.——Plans passed: Bungalow, off Darfield-road, for Mr. Wardle.

DARLINGTON.—The Streets and Buildings Committee of the T.C. have approved plans for the erection of 10 houses in Bowman-street, Harrowgate-hill; two in Linden-avenue; and also additions to the Park Hotel, Victoria-road.——Plans have been prepared for 30 houses, which are to be erected at Brinkburn-road, in connection with the L. & N.E.R. Co.'s scheme for its employees.

DONCASTER.—There is an important proposal afoot to considerably enlarge the Doncaster Station. The present scheme, it is understood, is being considered in official quarters of the L. & N.E.R., and would be a very costly scheme.——The B.S. has been instructed by the Public Health Committee to prepare plans for the erection of an infectious diseases hospital on the Common-lane, Balby, site.——The Governors of the Royal Infirmary have decided that the proposed new infirmary shall be built on the Thorne-road site.

DUBLIN.—Plans passed: 29, Lower Pembroke-street, new premises, Mr. J. J. Higgins; South Circular-road, steelwork for No. 2 Tobacco Factory, Messrs. J. Clarke & Sons; corner Hollybrook-road and Strand-road, Clontarf, shop and dwelling, Mr. P. Somerville.

EASTRY.—Messrs. S. Pearson & Son have informed the R.D.C. that they will shortly be building some houses near Betteshanger Colliery.

EDINBURGH.—The Dean of Guild Court has granted warrant for a scheme by James Robb to construct in all 24 houses at West St. Alban's-road, and 20 self-contained houses at Plewlands-avenue by the Scottish Provident Property Company. Included in the petitions granted warrant were the following:—Edinburgh Corporation, tennis pavilion at Saughton Park, Gorgie-road, and tennis pavilion at Rosefield Park, Portobello; J. Russell Greig, villa at Kirk Brae, Liberton; M'Kendrick & Co., Ltd., six continuous houses at new arterial road off Saughtonhall-drive; St. Cuthbert's Co-operative Association, Ltd., convert dwelling-houses into shops at Hamilton-place; Wainwright & Williamson, three blocks flatted houses, Greenbank-avenue and Greenbank-crescent.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

Shortage: Materials or Bricklayers.

At a recent meeting of the Hammersmith Guardians, Councillor White said it was folly to suggest there was a shortage of bricklayers. He had, he continued, in his employ, bricklayers who were forced to remain idle because he could not obtain supplies of bricks under a fortnight's notice. He urged that the Government should be informed of the fact that the lack of supplies was holding up the building industry, and said there had been an increase of 5s. per 1,000 bricks.

Hartlepools Builders' Association.

Mr. Sydney Pearson presided over the annual meeting of the Hartlepools Master Builders' Association, held at West Hartlepool, at which the following officers were appointed for the ensuing year:—President, Mr. F. R. Turnbull; vice-presidents, Messrs. D. Corbett and F. M. Gibbon; Northern Federation representatives, Messrs. F. M. Gibbon, R. Mothersdale, S. Pearson, A. Stephenson, and W. H. Thompson. The *ex-officio* member is Captain Tweedle.

New Housing Scheme.

The Minister of Health, speaking at Liverpool recently, said he realised the desirability of bringing the unemployed into the service of the nation in the provision of houses, and was hopeful of being able to submit a practical scheme for overcoming the difficulties.

New Hospital for Glasgow.

The directors of the Glasgow Hospital, 144, St. Vincent-street, were granted the sanction of the Glasgow Dean of Guild Court recently to demolish the existing buildings, 306–308, St. Vincent-street, and to erect a new hospital on the site. The estimated cost is £40.000.

EDINBURGH'S CONCRETE HOUSING SCHEME

BUILDERS are active in Edinburgh suburbs at present with villa residences. The two- or three-roomed houses for those who are forced to leave slum localities are being erected by the Corporation. Messrs. Angus & Son have 60 villa houses being erected in a field close to the canal at the terminus of the Craiglockhart tramways, on the Colinton-road. The feature of these buildings is that there is no stone being used, but concrete blocks and inside brick partitions. The outside walls are all of concrete made on the spot. Mr. Robb and Mr. Grahame have a similar class of house being built at Blackford-avenue, on the south side. Builders are busy, too, at Corstorphine, Liberton, and other suburbs.

The Secretary for Scotland, in reply to a question by Mr. Duncan Miller, the other day, said that the number of houses proposed to be erected under schemes put forward by Scottish local authorities under the Housing (Town-Planning), Act, 1919, was 115,674. The total number sanctioned for erection by local authorities under that Act is 25,129, and of these 21,011 had been completed at January 31, 1924. Partly for speed and cheapness, Edinburgh Corporation is building houses with the duo-slab system of building at Lochend, on vacant ground between the town and Leith. Messrs. Airey & Son, contractors, Leeds and London, are building these houses, in the duo-slab system, which admits of the utilisation of unskilled labour. It is expected that the Corporation will go on with at least 1,000 of these houses. Messrs. Airey & Son have executed, or at present are executing, similar contracts at Leeds, Crossgates, Cardiff, and Kirkstall. The Edinburgh houses consist of blocks for four families, each house having scullery, a living kitchen, parlour-bedroom, and bedroom. There is considerable space between each block of four houses. On a visit to the houses of the Greater Edinburgh Club, a display was given by a machine with the nozzle which distributes under pressure the rough casting on the walls. The method of erection, with space in the wall between the slabs, avoids the chance of damp. These concrete houses are intended in the first place to rehous the people turned out from slum areas in Cowgate and Grassmarket.

Mr. A. Horsburgh Campbell, Director of Housing, is satisfied that such houses of concrete. two or three stories high, are as substantial as houses built of brick. The city's recent experience with the concrete houses at Wardie was a local demonstration in proof of that point.

Boulevard for Edinburgh.

A boulevard scheme for Princes-street was presented recently before a committee of the Edinburgh Town Council. The project will come up at a later date for the Council's approval. The scheme is to dispense with railings on the gardens side of Princes-street and extend the width of the street by the medium of a terrace. The terrace, which would have to be built up from the gardens level, would be 36 ft. broad and 1,600 ft. in length. The cost is estimated at about £50,000.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Labourers.	Plasterers' Labourers.

NEW BUILDINGS IN SCOTLAND

Port-Glasgow.—SCHOOL.—The Roman Catholic Church authorities have purchased Glenbank House as provision for a new school.

Beith.—CHURCH.—It was stated at the U.F. Presbytery meeting, held in Paisley, that the plans and estimates for the proposed new church at Beith had been submitted. The proposed building is to accommodate 800 persons and the total cost is estimated at £10,408. The plans were referred to the Church and Manse Building Committee, with the recommendation that a grant be given.

Forrestfield.—SCHOOL.—The Lanarkshire E.C. has passed plans for temporary school at Forrestfield. the estimated cost of which is £1,500.

Dundee.—EXTENSION.—The Royal Infirmary were granted power to carry out the reconstruction schemes in Ward 10 and Maternity Block, the estimated cost of which is £2,200.

Coupar Angus.—ADDITIONS.—The T.C. is considering a proposal to erect additional municipal offices at a cost of £1,000. The Council has approved of plans for the extension of the pavilion at the bowling green.

Deskie.—HALL.—A public hall is to be erected at Deskie.

Forres.—SCHOOL.—The Moray E.C. has approved of the modified plans for the erection of a secondary school, at an estimated cost of £14,000.

Glasgow.—EXTENSIONS.—An appeal is to be made for £60,000 for the extension to the Royal Children's Hospital.

Brechin.—BATHS.—The T.C. has requested a report on the question of the provision of public baths for the town.

Housing Progress in Scotland.

The following figures show the progress that has been made in State-aided housing schemes in Scotland to February 29, 1924:—

	Completed.	Under Construction.
1919 Act	21,428 ..	2,920
Private Subsidy Schemes	2,323 ..	—
Slum Clearance Schemes	334 ..	1,175
1923 Act	37 ..	1,476
	24,122 ..	5,571

Of the total number of houses, completed and under construction under the 1923 Act, 619 are by the local authorities and 894 by private enterprise.

Obituary.

The death took place recently at Edinburgh, at the age of 72, of Mr. William Anderson, a well-known Edinburgh architect. Born at Selkirk in 1854 he was educated at the Burgh School. In 1874 he went to Edinburgh and in 1878 to Galashiels, where he joined, as principal draughtsman, the firm of Messrs. Herbertson & Son, with whom he remained for ten years.

OL. CXXVI.—No. 4235. APRIL 4, 1924.

ATTRACTING PUBLIC INTEREST

THERE has recently been some attention paid to the matter and manner of exhibiting architectural drawings, probably coincident with the very desirable discussion of the fact that the public really knows little or nothing about architects or their art. We have always felt that press boosting (to use an Americanism) was undesirable, but there seems no reason for allowing the people to be more ignorant of architecture than of other kinds of artistic work, particularly when architecture is one of the most intimate of all things connected with their lives—do we not all eat, sleep, work, worship, and enjoy our leisure in surroundings for which the architect is responsible—or should be? It is probably very largely the profession's own fault, but while publicity of the ordinary journalistic kind may not be what we would seek, there is no reason why the man in the street should know less of a building than a picture. The fact that he does shows that we have allowed a delightful art to be neglected.

We think we are right in saying that amongst the lay press only one or two daily and weekly journals give regular and well-informed attention to architectural views or matter, but it is an excellent augury that at least one well-known provincial journal, which is admitted to be of the highest intellectual standing, frequently gives attention to buildings of importance. On the other hand, when the Royal Academy opens, or when any other interesting exhibition of pictures is announced, every newspaper and most weeklies give it some attention, and the leading picture is produced on back pages, while important illustrated weeklies publish selections of the exhibits—the artists are interviewed, and generally a great deal of delightful and sometimes foolish chatter and palaver is caused. We do not think our friends, the artists, are always conscious of the value of this in placing their names before the world, and there is certainly nothing undesirable in keeping people interested and therefore informed. But the public never have a proper opportunity of discussing or appreciating current architecture, although, as we have said before, it is the most intimate of the arts. It is not *its* fault that it is not given so much opportunity to speak of architecture as it is of the possible but speculatory constitution of the inhabitants of Mars.

Undoubtedly one of the reasons for this is the very small opportunity that is given to the public to examine and appreciate architectural drawings. We have only to notice how keenly interested they become when the opportunity is given them to realise that we are neglecting them. One of the reasons for this is probably that, as they are supposed to see certain buildings every day, or may sometimes see a photograph of one, they do not need such facilities for being informed. But this is an erroneous idea. While the general public seldom enter an artist's studio, they have a very good idea of the way in which he works, artists being supposedly romantic: they figure neatly in current popular fiction, which again familiarises the public with their work. Not so fortunate the architect. His work and life is not so known. The average person has no more idea of his ways than he has of "the religious scruples of a cannibal," as we heard it expressed once. The public, therefore, ought to have some opportunity of seeing the drawings and appreciating, as they readily do when given the opportunity, the grace and beauty of the processes by which a building is conceived and designed.

There are art galleries in most of the important towns, many of them with both permanent exhibits and exhibits which vary from time to time. In a very few cases architecture receives some consideration, but it is not common, and is more or less purely by chance. Recently the Manchester Art Gallery had two exhibitions of architectural drawings, the public interest in which was very marked, but it is not habitual for them to do so. Why should not the committees of these galleries allow a space for the most interesting of current architectural matter? It seems quite reasonable to suggest that the room or a portion of one room might be so utilised, and if, for instance, the suggestion made by a contributor in our issue of February 22, 1924, were put into effect the drawings of the medal buildings in that district might become semi-permanent exhibits, giving place from time to time to the needs of space, since if each year the medal design was hung in perpetuity the amount of architectural drawings might override their proper quantum of space.

We see no reason why the National Gallery should not provide for one room of architectural drawings—there are many interesting drawings hidden away in fusty libraries, where they can only be seen after a ceremony reminding one of the inspection of a vault at the Bank of England—which would be utilised much more usefully if they were displayed in some suitable place, properly protected from the effect of light, where all and sundry could see them. An exhibition of such drawings from the earliest known to some of our last great draughtsman's work would be most interesting and instructive, and we doubt if anyone has ever seen a set of such drawings grouped in this way, although there must be enough in existence to make a most interesting show. The Tate Gallery might have a room for architectural drawings, and it could contain, as in its pictures, the best of the modern school of work, with examples of some of our foremost perspective artists' drawings. Here would be an excellent place to display the medal drawings of London's medal buildings, as at present being selected by the Institute, in periods of, say, ten years, at the end of each ten years the best of the ten to be retained.

If some such scheme as this could be carried out, especially if it were done coincidently with a scheme for selecting the most interesting buildings of the year in different districts, there is no doubt that a great deal of legitimate attention would be attracted from the public itself, and intelligent comment from the lay population would be fostered. It would be a great advantage also to those of the public who are potential clients of the architects to have a more enlightened outlook on the work of the profession. It would clear away a great quantity of misunderstanding of the functions of the architect, and we might no longer be congratulated by intelligent friends on our "tender for designing and building" having been accepted.

One does not hear the public speak of asking competitive prices from barristers, solicitors, and doctors; while it is quite a common thing for a member of the public to imagine that they are astute and getting some "architect" (who, of course, is no architect) to "do" a design for them "cheap," and lay the blame for the inevitable disastrous result on the profession. What, in short, architects sadly need is a little more publicity, not so much as individuals, but as a body; and it is by such means as we have suggested that the public will learn to know more of, and to appreciate, a great profession and the art it represents.

NOTES.

The Government's Housing Plans.

The housing proposals of the Government have been stated in some detail in a portion of the daily press, and we understand that the report of the Committee appointed to consider the housing question is to be presented immediately. The Government scheme is for the erection of three million houses in the course of fifteen years, and it is proposed, we are told, "to set up a statutory committee, composed of representatives of building trade manufacturers, building trade operatives and building material manufacturers," which is not very explicit, unless by "building trade manufacturers" is meant building trade employers, who appear to have some claim to be represented on such a committee! The Committee is to be responsible to the Government for carrying out the housing programme, except as to finance, which will be dealt with by the Treasury and the Ministry of Health. On the question of cost, the Committee recommend, it is stated, that the minimum floor space of any house built under the scheme should be 850 superficial feet, and the cost not more than £450 per house. Houses of 950 superficial feet, the Committee state, should not cost more than £515 per house. In the absence of the text of the Report, we accept these statements with reserve, though we may remark that the minimum floor space proposed is a great improvement on the proposals of the late Government in their Housing Bill as introduced. The Report also deals with the shortage of labour and the allocation of work, the control of prices, and the "guaranteed week." It will be noted that the three million houses in fifteen years are the 200,000 houses per annum which it is known the Government desire to provide, but, according to the statement made in the House of Commons, 200,000 houses per annum would exhaust the supply of bricks available for all classes of building.

Waterloo Bridge.

We are now seriously faced with the problem of London bridges. The opposition to St. Paul's Bridge steadily grows in strength and influence; and the, various suggestions for dealing with Waterloo Bridge are discounted by the announcement that a vote of a million pounds is to be brought forward for strengthening and widening it. We have been expecting the blow to fall for some time, for Waterloo Bridge was clearly inadequate to the immense volume of traffic passing over it. The present state of affairs in regard to London bridges' traffic affords a striking illustration of the lack of foresight in the management of our affairs. We cannot help wondering how it is that so fatal a misapprehension exists as to the importance of road approaches to existing and projected bridges. The whole question of the bridges is inevitably linked up with the general development of road traffic in and about them, and in the interests of the future well-being and growth of London it is of the utmost importance that the relation of its bridges to its road traffic should be seriously considered at once. If we have wasted the expenditure on Southwark Bridge, and are going to waste more on St. Paul's, and spend more still on Waterloo, what can be said of the wisdom of this present wide-awake time? It certainly behoves all those who have worked strenuously for a better London to take some urgent measures for an official recognition of the seriousness of the situation. The L.C.C. has done so much for London that we may reasonably hope it will consider well proposals affecting one of the finest bridges in the world.

Looking Ahead.

We are fairly certain have a new bridge over Thames in the near fut whether it be St. Paul's Charing Cross. May we raise our v in time with a warning prompted memories of the waste places of Aldw and Kingsway, which we suffered so lo and which even yet have not enti given place to decency? These brid will mean the laying out of many streets and the demolition of many a which may lay in their ugliness for m years before the slow tide of eve washes them clean. Surely the wea of the metropolis can stand for the c paratively slight expense of laying such areas as temporary parks and garde so that the long process of metamorph may be made tolerable? Or are never again to look tidy?

The Wembley Strike.

The building trade str at Wembley is signific of the attitude of mind some sections of labour, is to be regretted for more reasons t one. The known desire to complete Exhibition for the opening day appe to have had much to do with the act of the men, but we are glad to know t the union repudiates this action. A well known, a national demand has b made on behalf of the building tr operatives for an increase of 2d. an ho and it appears to be part of the calculat of the strikers at Wembley that the str will induce employers elsewhere to c cede the national demand, but there really no analogy between the Wembl undertaking and building work in oth parts of the country. At Wembley t operatives have been receiving more th the current rate of wages, and labour been attracted there to the detrim of employers in other districts, and doubt whether these employers will any more willing to-day to pay the

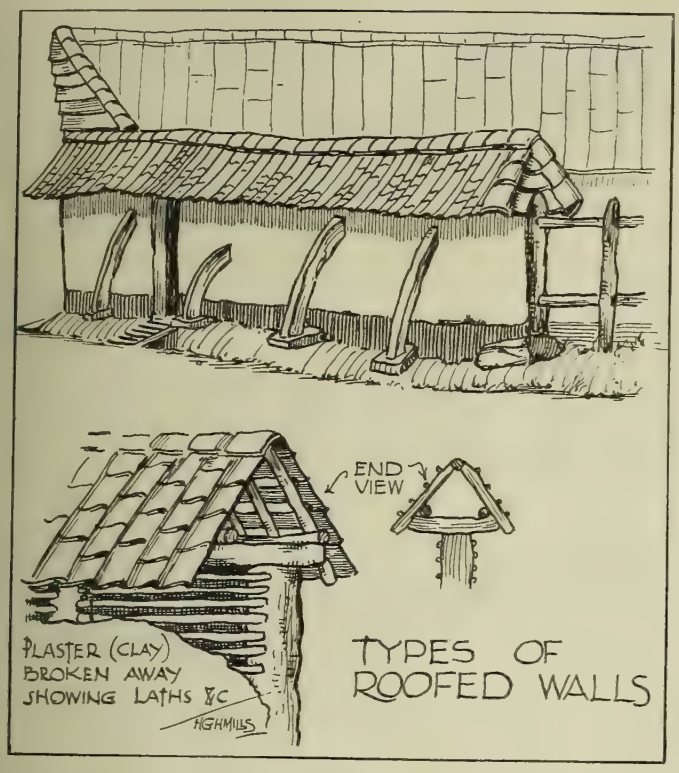

Fig. 5.

From Sketches by Mr. H. G. H. Mills. (*See p.* 528.)

ease demanded than they have been in cent months, and certainly not by ich a strike brought about in such a ay.

The Rent Bill.

The new Rent and Mortgage Interest Restriction Bill has now been issued, and its second reading has been oved by the Minister of Health. A more astic measure affecting one class of operty-owners it is difficult to imagine, d the Government can have little hope carrying it in its present form. The ıuse which will excite the greatest ıount of opposition decrees that the urt shall not make or grant an order r the recovery of possession of a dwelling-house or for the ejectment of the tenant therefrom on the ground of non-payment of rent in any case where it appears to the Court that the non-payment is due to the inability of the tenant to obtain employment, unless the Court is satisfied that greater hardship would be caused by refusing to grant such order or judgment than by granting it. If tenants are to be exempted from paying rent on account of unemployment, why should they pay for anything else?

A Wasted Opportunity.

The Architecture Club exists to promote interest among laymen in current architecture, and the admirable exhibition now at Grosvenor House is directed to that end. It is much to be regretted that the series of informal lectures given every afternoon should be so little known and so poorly attended. The panel of speakers has been carefully chosen, and the subjects are popular in character. We are certain that if this series had been advertised amongst "arrangements for the day" in the general Press the exhibition would have benefited by an increased attendance, and that many people would have enjoyed the opportunity to learn something about the varied facets which the subject presents. As it is, the few casual visitors who happen to be at the exhibition during the lectures glance into the lecture room and assume the alarmed expression which overcomes the sensitive tourist when escaping from a professional guide. There is no notice outside the room to explain who the lecturer is and what is the subject, or to make it clear that admission is free. While congratulating the Club on its initiative, we wish it would take steps to secure a wider field for its influence.

London's Sunshine.

Dr. J. S. Owens, in a recent letter to *The Times*, draws attention to the steady improvement that has taken place in the records of London's sunshine as calculated from the Meteorological Office records. The percentage of sunshine in London as compared with that in the rural stations of Oxford, Cambridge, Geldeston and Marlborough, is shown on a table which we illustrate in graphic form on p. 528. The table forcibly brings home Dr. Owens' statement that, in spite of the improvement, the air in our cities is still vitiated to an intolerable degree. It also occurs to us that the improvement may be partly illusory on account of the increased smoke in the towns of Oxford and Cambridge. Our comparison places should be situated outside the effects of smoke altogether.

GENERAL NEWS

Professional Announcements.

Messrs. Cooke & Davies, F. & A.R.I.B.A., architects, have removed to No. 44, Great Russell-street, W.C. 1. Their telephone number remains the same (Museum 4136).

Mr. Wallace J. Gregory, L.S.A., has removed to 7, Carteret-street, Queen Anne's-gate, Westminster, S.W. Telephone number: Victoria 4093.

Messrs. Lionel U. Grace, F.R.I.B.A., and W. G. Farmer, M.S.A., have removed from 114, Queen Victoria-street, E.C.4, to 3 and 4, Wardrobe-place, Doctors Commons, London, E.C.4.

The address of Mr. F. C. W. Stacey, quantity surveyor, is now 176, High-street, Acton, W.3.

Architect's Estate.

Mr. A. E. Mullins, of Wilton, Mickleburgh Hill, Herne Bay, Kent, for many years an architect and surveyor at Peckham (net personalty, £5,501), £5,651.

St. Paul's Bridge.

A deputation of the Royal Institute of British Architects will attend a meeting of Metropolitan Members of Parliament at the House of Commons on April 8 to impress upon them arguments against the proposed St. Paul's Bridge scheme.

New Thames Port.

Plans have been prepared by the Thames Land Co., Ltd. (a subsidiary of S. Pearson & Sons, Ltd.), for a new industrial town and port, with a deep-water wharf a mile long, at West Thurrock, on the Thames, near Tilbury. The property extends inland for 4½ miles, and is intersected by the L.M. & Scottish Railway, with which line railway connections will be made to the wharf and factories which it is hoped to develop. The cost of the wharf is estimated at £1,200,000; and of the railways, £270,000. It is understood that Parliamentary powers are being sought, and that constructional work will be begun as soon as possible.

The Walls and Gates of Peking.

The beauty of the City Gates of Peking, their importance as characteristic elements in some of the finest views of the Chinese capital, their wonderful setting amidst old buildings, fresh trees and decaying moats, their decorative architectural character, are well known to those who have visited the city, but no adequate representation of them has yet appeared in this country. Professor Osvald Siren of Stockholm, with the permission of the Chinese Ministry of the Interior, has devoted several years to a faithful study of the subject. He has now brought to England 110 photographs and 50 architectural drawings made by Chinese draughtsmen under his supervision, which illustrate with remarkable completeness the artistic and historic importance of these ancient gates and walls. These drawings and photographs will be exhibited in the Galleries of the Royal Institute of British Architects (9, Conduit-street, W.1) from Monday, March 31, to Saturday, April 5. The Exhibition will be open (free) between the hours of 10 a.m. and 6 p.m. (Saturday 1 p.m.).

Victoria and Albert Museum.

The roodloft from the Cathedral of St. John, at Bois-le-Duc ('s-Hertogenbosch), in North Brabant, Holland, which was pulled down in 1866–7 and ultimately purchased by the Victoria and Albert Museum in 1871, has been moved from its old position in the Cast Court of the Museum and re-erected across the East Hall. This excellent example of decorative architecture was erected in 1610-13 by Coenraet van Noremberg, of Namur, after the pattern of the roodloft in Antwerp Cathedral, which is now destroyed.

It is composed of red, black and grey Belgian marbles with figure sculpture and decoration in alabaster—the original contracts for the work, which are still preserved in the archives at Bois-le-Duc, stipulate that some of this alabaster was to be English. The west side has figures of five virtues (Faith, Charity and Hope in the west face, Justice on the north, and Peace on the south); between these are four smaller figures holding shields charged with the arms of Brabant, Duke Godfrey of Bouillon (the founder of Bois-le-Duc), the Archduke Albert and Isabella, and Bois-le-Duc. Small panels set under the balustrading are carved with scenes from the life of Christ, beginning with the Nativity and ending with the Ascension. This series is continued on the east side with the Last Judgment and the Seven Corporal Works of Mercy. Above the pairs of columns which support the arches of the roodloft are statues of the Virgin and Child, St. Peter, St. Paul, and St. John the Evangelist. This latter figure has been ascribed, on the analogy of the figures on the monument of William the Silent at Delft, to the Dutch sculptor, Hendrick de Keyser (1565-1621), and it seems possible that the St. Peter and St. Paul may also be by him.

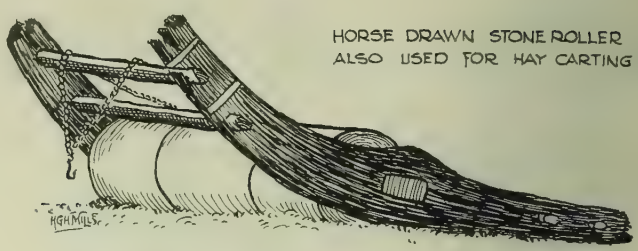

Fig. 6. Sketch by Mr. H. G. H. Mills.

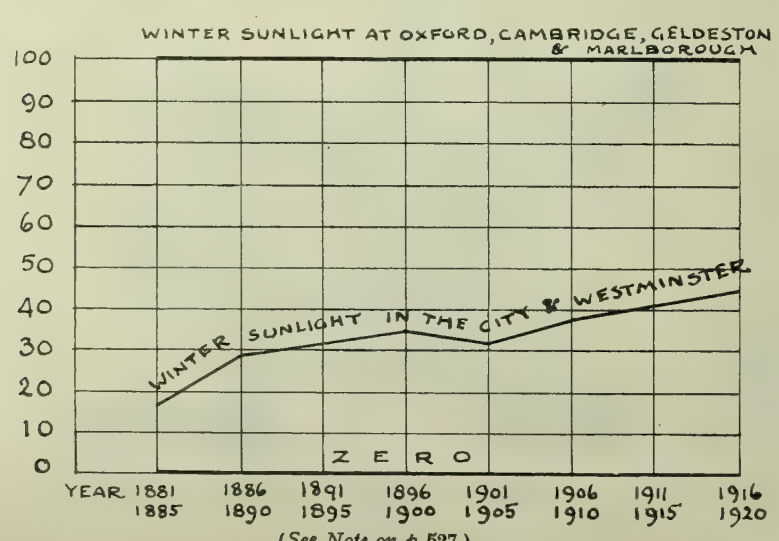
SKETCHES IN FRANCE



The sketches on this page and on pp. 526–5 are by Mr. H. G. H. Mills.

Figs. 1, 2 and 3 are different types of roof entrances to farms. Fig. 1, dated 1776, bei pre-Revolution, was probably originally t entrance to a chateau, and has some slight pr tension to Classic design, while Fig. 2 w probably built for its present purpose, but sho indication of either having been restored or t roof rebuilt. Fig. 3 is practically a cartw through the end of the barn—of the usual timb and plaster type—another barn adjoining, a both having entrances from the cartway. The farm buildings, built round three or four sides a rough square, are invariably raised, with cobble path outside, necessitated by the centr square being the general manure and refu heap, and drainage being largely consider superfluous.

Fig. 4 shows an interesting arrangement f shoeing horses, in that the movement of t horse is considerably restricted when placed the cage. A chain passed loosely under t animal further restricts movement, while if hind hoof is to be shod it is firmly lashed wi rope to the crossbar at the end.

Fig. 5 shows two types of roofed bounda walls in one of which is a doorway into th farmyard. The other indicates the gener method of construction, the posts and stru being thick branches or roughly squared timbe

Fig. 6 is a very simply constructed and in teresting horse-drawn stone roller, and is fre quently used as an aid to harvesting by pra small holders, who will harness a horse to an thing that will move and transport hay, even small quantities.

(See Note on p 527.)

COMPETITION NEWS

Salford Baths and Washhouse.

The Baths Committee invite applicatio from architects for permission to submit co petitive designs for public baths and a was house. Applications to be sent not lat than April 22 to the Town Clerk.

Hollbrook School.

The Board of Admiralty propose to inv six architects with experience in the planni and erection of large schools to enter into limited competition for a school to acco modate 1,100 boys. The Board will consi the names and qualifications of those will to compete, who should send in their names the Director of Greenwich Hospital, Admiral 48, Cornwall-gardens, S.W.7, on or before Ap 11. The professional adviser is Sir Ast Webb, P.R.A.

Kingston Union Nurses' Home Competition

We understand that particulars of this Co petition, details of which have yet to be arrang are not available at present, but will be issu later in such form as the promoters thi desirable.

Other Competitions.

Other competitions still open include following (the dates given are, first the sendi in date, and second the issue of *The Builde* which full particulars were given) :—Indust Designs (June; Dec. 21, 1923). Natio Theatre (April 26). Ross-Smith Memo (Sept. 30; Feb. 1). Bradford Masonic Tem (June 30; March 28).

CORRESPONDENCE

Professor Pite on Architectural Education."

Sir,—Professor Pite, in his scholarly treatment the subject of architectural education at the inburgh Architectural Association, recently, urally assumed that the primary object education is to enable the rising genera- n to produce better work than the present ieration (an idealistic and altruistic motive); t there are other aspects of the question which peal more to the commercial mind of to-day. t has been truly said that the mind only sees at is in itself. Our contact with the world is y within the limits of our physical and mental periences. Education may appeal to the ividual for several reasons:

1) The increased capacity it gives for doing ter work.

2) The increased enjoyment it gives to our nan relations and contact with the world erally.

3) The increased capacity it is supposed to e to earn a livelihood.

The first is the ideal reason, but as Professor e said: "Ideals die when economy takes the is." No past age has ever seen such economic os introduced into the world of art as we e to-day. Few of us have remained un- ited by the pressure of economic circumstances. What is the attitude of the student of to-day? finds himself in a world where scholarship no ger receives its due reward. On every hand hear the same story. The student of to-day not the enthusiasm of the student of 20 or years ago.

The failure of the R.I.B.A. Studentships to act competitors is only a sign of the times, we have not yet seen any statement which ears to me to give the real reason of their ure to attract competitors. The student of lay on looking round sees men who have er been trained—perhaps an ex-clerk of ks—carrying on, as architect, contracts of e amounts, or an ex-joiner acting as arbiter a competition; or half-baked architects are civil and Corporation draughtsmen ying on contracts of (presumably in their time?

e (the student) sees architects who have r received any academic, classic, or technical ning with touring cars and living in large ses built by themselves.

he student of to-day naturally asks: "How these things be?" He sees men who spend their afternoons loafing in the smoke-room billiard-room at the club with a large and unerative practice. Again he asks: "What ne use of perseverance and scholarship?"

venture to suggest from our contact with rising generation that these considerations ainly greatly influence the mind of the lent of to-day.

eedless to say, Professor Pite's lecture was masterpiece of clear thinking and sound oning, but he took the high ground of the list and altruist for his outlook. He hinted he futility of our present system of exami- ons. No lover of the profession would like e men like Wren or Kemp (I do not say Kemp was a great architect) debarred from practice of architecture because they had not through some academic mill with its dule of examinations, but so long as anyone call himself an architect by putting up a the futility of trying to close the doors into profession by means which do not ultimately a man of culture and training some guaran- f adequate return for years of labour and acrifice are futile. Certainly it has been ly demonstrated that the laborious study work does not necessarily produce a great en a moderately efficient architect. We all men who have ignored the academic way have turned out masters in their art; no t because of some inherent traditional n which gave them that natural intuition of s in all things.

e thing seems clear: no system of school or ersity education will of itself produce any- but academic rearrangements of old styles s it is founded on the practical needs of nt-day requirements, structural necessities, and present-day economic limitations, into which are infused some element of spiritual ideals and intellectual vision. The architecture of the Egyptians, Greeks and Romans died when the people lost their vision. So will the architecture of Britain die when ideals of beauty as an end above price cease to exist.

To acquire a practice, personality is a greater asset than scholarship, and an agreeable manner than great erudition. Of what use, then, is a cold-blooded system of academic examination? So asks the student.

William Davidson.

Whitby Abbey Restoration.

Sir,—As the writer of the letter which is referred to at the beginning of Mr. Harvey's article on this subject in your last issue, I must intervene with a brief rejoinder. He writes with such evident sincerity that I am reluctant to criticise what seems to him a reasonable procedure, though the artistry of faked ruins is not one I can endorse. The frank recognition of the impossibility of restoration in such a case is much better expressed in what the writer calls "crude masonry" repairs than in any plausible attempts to imitate the original—and what is to be said for imitating ruins? Here is a new form of revival the Gothicist never dreamed of. To rebuild ruins which have been blown down by Hun fire in the name of preserving the past produces a sort of cerebral disorder in the mind, which cannot grasp it. To hasten the disappearance of the ancient remains in this way, in the belief we are conservators, paralyses the understanding? The writer tells us that "it is possible to recognise a spiritual quality in the sincerity of fine craftsmanship," in speaking of ancient monuments, but what evidence of such recognition is conveyed in raising up a new ruin out of the old one? The artistry of such ruins I am unable to appreciate, because they blot out this very quality. Is it being alive to the appeal of ancient monuments to obscure their message in this ridiculous way? It is pathetic to think of such restoration as that bestowed on the entrance to Whitby Abbey by the Historic Buildings Branch appearing to anyone as preserving the "spiritual quality" of these old ruins. If ruins, as the writer suggests, become matters of indifference to the public, unless kept in this sort of repair, is it not better that they should be indifferent rather than misled and the ancient monuments disfigured? Such restorations as imitating ruins, &c., falsify history and the spirit of old work, accustoming us yet more fatally to shams; and the argument of the "turnstile" as evidence of popular interest is no justification for these grotesque resuscitations. To re-establish decay is not preservation of the spiritual quality the writer so justly values, but a kind of body snatching. Let us rather prefer to see these old ruins rest as they are, baring our heads before their inspired endeavour, which forbids such sacrilege and disturbance; and if repairs are made, to prop a wall or stay collapse, let them be limited. As the repairs at Whitby Abbey, we are told by the writer are only "part of a larger scheme," the imagination recoils at the possibilities that may be in store for us.

The Correspondent.

Beverley War Memorial. Mr. F. L. Pearson, Architect.

[This memorial, executed by Mr. Robert Davison of London, was unveiled in the Soldiers' Chapel of Beverley Minster.]

Mr. J. A. Gotch (President) occupied the chair on Monday at 9, Conduit-street, W., at an ordinary meeting of the Institute.

Mr. A. Keen (Hon. Secretary) announced the decease of the following members: Mr. Albert Edward Murray, R.H.A., elected a Fellow 1889 and placed on the list of Retired Fellows in 1923. Mr. Murray was a Past-President of the Royal Institute of the Architects of Ireland and represented that body on the R.I.B.A. Council during the Sessions 1911–1912 and 1913–1914. Mr. William Edward Willink, M.A., Cantab., elected Associate 1885, Fellow 1898. Mr. Charles Stuart Delfosse, elected Associate 1882. Mr. William Charles Antcliffe, elected Associate 1909. Mr. John William Key, elected Licentiate 1912. It was agreed that the regrets of the Institute be entered on the Minutes and a message of sympathy conveyed to the relatives.

GOTHIC ARCHITECTURE OF THE 19th CENTURY.

Mr. H. S. Goodhart-Rendel then gave an address on "English Gothic Architecture of the 19th Century," in the course of which he said Gothic architecture, as everyone knew, was the only architecture in this country from the acceptation of the pointed arch until the gradual perversion at the end of the sixteenth century of the style of the Renaissance. This successful style gradually ousted Gothic from its place and power. The Church of England held to the old way of building for a century or so, compelling even Sir Christopher Wren to its occasional practice, and it was not until the second half of the eighteenth century that new Gothic buildings for ecclesiastical or educational purposes became unusual.

Very soon after this conscious revival began, sometimes as serious as in the octagonal churches built in 1756 at Hartwell in Buckinghamshire, any little thing Gothic became the fashion among the *beau monde*. Gothic hermitages and Gothic parlours with traceried wall-papers, with Gothic baths in noblemen's parks, might not seem very robust descendants of the ancient lines of Canterbury and Westminster, but it was impossible to find any point at which the succession broke. In itself it must be admitted that this revival of Gothic forms was of little importance. It contributed, however, towards something quite important, when considered together with the revival of the constructional in Gothic which could be seen appearing in the humble building tradition of England during the seventeenth and eighteenth centuries.

In the year 1800 James Wyatt, the leading architect of the day, had already been at work for four years upon William Beckford's palace, Fonthill Abbey, in Wiltshire. Of this building, which cost more than a million pounds, and upon which at one time 460 men were at work in day and night shifts, not a stone now remained.

This prodigious house was the most magnificent and the most famous of a large number of similar buildings which the Gothic taste brought into being at the beginning of the last century. Europe had turned from reason to romance, and men of true sensibility sickened at the sight of porticoes, even in France, where the architectural elements of Roman antiquity had become embodied in a living and fertile style; the call of the Middle Ages broke up for a time the academic camps.

Almost contemporary with the works of James Wyatt were those of John Nash—afterwards famous for his London improvements during the Regency. Nash was, like Wyatt, a great picture-maker, but he was incorrigibly idle or ignorant in his choice of details. James Wyatt and John Nash had many imitators, among the earliest of whom William Wilkins, William Porden and William Atkinson were conspicuous. Many old houses of post-Renaissance design were recased within Gothic exteriors—generally absurdly enough. Mulgrave Castle, in Yorkshire, for example, was so treated by Atkinson, and Hawarden Castle in North Wales, by James Cundy, architect of Grosvenor House. The high fever of castle-house building upon which the last century opened did not at first infect any other department of architecture. There was, if anything, a falling-off in the normal supply of new buildings for public and educational purposes. Speculative building of small houses, which was to change the face of England after Waterloo, had not yet been dreamed of. Nor had the wildest dreamer foretold the battle between the "Gothic" taste and the established "Grecian." Almost the only churches of the passing period which they could esteem as of architectural merit were those designed by that distinguished student and theorist of mediæval architecture, Thomas Rickman. Rickman was a Quaker with a passion for Gothic churches. In 1812 he published some literature on Gothic architecture which was republished five years later in the form of that handbook which had been, ever since, the accepted primer of English Gothic. Perhaps his chief claim to commemoration was his invention of those terms, "Early English," "Decorated" and "Perpendicular," by which three phases of English Gothic continued to be commonly designated.

In 1825, John Chessel Buckler designed Costessey Hall in Norfolk in a Gothic style which, unlike Wyatt's, comprised no features of ecclesiastical architecture, and unlike Nash's, made no pretence of castellation. The new fashion became instantly successful; everywhere the castle gave way to the manor-house. The mention of this coquetry with the Renaissance was necessary because this backsliding from the Gothic faith was one of the things which roused the wrath of the great reformer, Augustus Welby Northmore Pugin. At the age of fifteen Pugin designed the furniture for the new rooms at Windsor Castle; at 32 he was the best-known church architect in Europe. At 39 he went mad, and at 40 he died. His enormous power of draughtsmanship, his love of the stage, his skill in religious polemic, his passion for the sea, and his humour as a writer, all emerged in the memorials of him compiled by his friend, Benjamin Terrey.

Pugin's true principles, disentangled from his untrue prejudices, had since been accepted even by the descendants of the neo-Classical school which he so strongly condemned. The foundation of them all was his message to a self-tortured architecture that it was not necessary to suffer to be beautiful. Plan your house to suit your habits, he said, in fact, and let your plan suit your elevations.

Pugin's friend and exact contemporary, Richard Cranwell Carpenter, was the architect hope of the Tractarians. Of the few churches which he lived to build, St. Paul's, Brighton, and St. Mary Magdalene, St. Pancras, were the best known. Carpenter was a true artist without the fire or the precocity of Pugin, but perhaps with more discretion in design.

In 1845, Derick acted as Dr. Pusey's architect in the planning of St. Saviour's Church at Leeds. This building is markedly in Pugin's style, and other works of its designer showed the same influence. The Tractarians, however, appeared not to have been satisfied for long with Derick's abilities, and as the movement progressed he dropped out. The Cambridge Camden (afterwards Ecclesiological Society) controlled the architectural taste of the T tarians, and propounded about 1845 a d which Pugin could scarcely have suppo This dogma was the exclusive claim amon Gothic styles of the Middle Pointed for m adoption.

In conclusion, the lecturer said to the stu of religion there was nothing more intere in the history of the nineteenth century the unconscious Puritanism of many o early Tractarians. This was not hard to u stand considering the circumstances under the Tractarian movement began. Butte was its only exponent in architecture. buildings never condescended to please. fact, they often seemed intended to a Strange and harsh outlines, violent con of colour, and heavy masses com in his works with great vigour and nobili form, and a constitutional logic very fin unswerving. No artist could fail to be unn by the great mass of St. Matthias's Chur Stoke Newington.

Discussion.

Professor Beresford Pite, in proposing a of thanks to the lecturer, said the extent acquaintance with the work of the last ce was remarkable and the paper would be e ordinarily valuable in their record. It strange how rapidly things moved and how all that was stimulating and virile passed the scene; how rapidly the architectural scape changed. Mr. Goodhart-Rendel confessedly dealt with an era which was although he concluded with the hope tha Gothic work would still live. This revie important; it was not merely intere The amusement with which some of its had been received was scarcely well t It behoved them, in their modern la enthusiasm, in their modern scepticism regard to architectural ideals, in the v impotence of their imaginations—all of were abundantly proved by the competitio the past twenty years and by the desig the students in the most recent day—to with the greatest respect and to seek to as consistently and earnestly as they could extraordinary mental vigour, imagina agility and fertility of the Victorian archi Nothing was more deplorable than to cultivated men and women of the present unable to appreciate the standpoint of a pre generation and unable to perceive what architects thought when the buildings erected which they unhappily had to inh Respect, piety, not to say affection for ancestors, was a decency of ordinary life. cynicism of some of the lecturer's referen the successful architects of the last centur been dignified by the justness of his criti There was a great deal which was hum about Sir Gilbert Scott's zeal for business that was not strange to them now; and everything had been discounted, the g grandeur and completeness of his achiev as a great architect was patent. Th Pancras buildings were certainly remarka any review of European art, and their disti originality, the way every detail had thought out and brought out, and the g success of the grouping were most suf testimony to the mastery which Scott exe But apart from the smaller buildings, was remarkable that that age produced at on Houses of Parliament—surely the most be group of modern buildings in Europe—a Royal Courts of Justice (extraordinary ir power and scholarship and freshness of ou Place with these the churches and the cha work of Norman Shaw and its influe country houses, and they must be co that they were face to face with an archit period of immense importance and prodi ness, and the work was that of a group equal in vigour and outlook to the architects of the fifteenth century.

Professor A. M. Hind (Slade Professor Arts, Oxford) seconded the vote of than said he did not feel that the designs o younger architects and students showe

le's house at Strawberry Hill was seen by
one, and did an enormous amount to
arise people with the idea of building
s in the Gothic manner. It was clear that Pugin got his knowledge of Gothic in the first place by working on his father's books. Later on someone asked him how he acquired his knowledge of Gothic and he said, "I lived in three cathedrals." He wished students would bear that in mind, for that was the real way in which the Gothic revival went on—it was the study of actual buildings. England was a built-up country, and much of the work architects were likely to get was the reconstruction of existing buildings, and it was a defect of the present flourishing school that there was not the study of these old buildings there used to be.

Mr. Goodhart Rendel, in reply, said he was compiling a list of all the churches in England and their architects, and he would always be pleased to give information to architects in relation to these.

NOTES FROM THE MINUTES.

We take the following from the Minutes of the R.I.B.A. Council Meeting held on March 17 :—

R.I.B.A. Essay Prize.—The annual value of this Prize was increased from 25 guineas to £50.

The Royal Artillery War Memorial.—It was decided to approach the Fine Arts Commission with regard to the site of the memorial.

Professional Conduct.—Three members having infringed the rule of professional conduct which protects a member from attempts to supplant him in his employment, one of them was censured and suspended for twelve months, one was censured and suspended for six months, and the resignation of the third was accepted.

Newbury Building By-Laws.—It was decided to communicate with the Ministry of Health in support of the Berks, Bucks and Oxon Architectural Association's appeal against an oppressive by-law.

The Manchester Society of Architects.—The admission of the Burnley District Society of Architects as a branch of the Manchester Society was approved.

Reinstatement.—Mr. J. S. Heath (F) and Mr. J. F. Schofield (A) were reinstated.

Memorial Gates at Tattenhall Church, Cheshire.
Messrs. Douglas, Minshull & Muspratt, Architects.
[These gates were executed by Mr James Swindley of Chester.]

R.I.B.A. Diploma in Town Planning.

The Examination for the R.I.B.A. Diploma in Town Planning will be held for the first time on October 15, 16, 17 and 20, 1924. Candidates applying for admission must be either Fellows, Associates, or Licentiates of the R.I.B.A., and applications must be made before May 31. Forms of application for admission, containing the Regulations and Syllabus, may be obtained at the R.I.B.A.

St. Paul's Bridge.

The Royal Institute of British Architects state :—

"It is evident from the reply which was given by the Minister of Transport when he received on March 11 a deputation from the R.I.B.A., the London Society, the Town-Planning Institute and the Architecture Club, that the Government are committed to a financial contribution towards the cost of the approaches of St. Paul's Bridge, if and when the authorities responsible finally decide to proceed with the scheme. At a meeting of the representatives of the abovementioned societies, held on March 17, it was decided that further steps must be taken to acquaint the public of the necessity of opposing the building of a bridge at St. Paul's. At the request of the societies concerned, Sir William Bull, M.P., has invited the Metropolitan Members of Parliament to a meeting in the House of Commons, which the deputation will attend; and selected speakers will impress upon those present the arguments already advanced against the St. Paul's Bridge scheme by letter to the Prime Minister and verbally to the Minister of Transport. The meeting will be held in Committee Room No. 9, House of Commons, on Tuesday, April 8, at 4.30 p.m."

THE LONDON SOCIETY

On March 26 members of this Society visited Chelsea Hospital. The buildings, which, perhaps, few Londoners visit, were designed by Sir Christopher Wren in the reign of Charles I, who died five years after. It consists of two quadrangles, the side next the river being open. The dining-hall and chapel are of similar design, the latter being adorned with some wood-carving by Emmett. The former is not used for dining but is fitted up as a recreation room, and in both are a number of flags taken in the wars of the last century.

There are houses for the Governor—always a life appointment for a General—and a Deputy-Governor. In the absence of the chairman the party was in charge of Mr. Henry Lovegrove, member of the Council, and Miss L. Crum, the assistant secretary.

It is stated that the ugly buildings which disfigure Burton-court will shortly be removed.

EXHIBITION NOTES

The A.A. is to be congratulated on getting together from time to time exhibitions of varied character, which should appeal to all tastes. The present exhibition is a small but interesting show of posters by Mr. F. Gregory Brown. Those executed for Messrs. Bobby & Co. appeal to us as being the most successful; also his "Epping Forest" for the L.N.E.R. This is a broadly-handled woodland scene, with gnarled old trees in sunlight and shadow, effectively handled. Mr. Gregory Brown excels in his treatment of trees and foliage, and his posters do not leave too much to the imagination. The public have not all received an art training, and do not stop to solve puzzles. It is the masses to whom the posters should appeal, and not only the aesthetic and cultivated few. Arresting designs are those advertising Dorking, and the Animals' Welfare Week poster—the latter, a lamb on a strikingly dark backgrounnd, should make an appeal to many. The exhibits collectively are highly meritorious. Some 25 designs are exhibited and remain on view until April 24.

STAIRCASES.—II

(BASED ON THE WORK OF M. GUADET).

By T. P. BENNETT.

HAVING considered the staircase as an architectural detail, it remains to discuss it as an element in architectural composition.

The "perron" first claims attention, and it should be said at the outset that, although its effect is extremely monumental, it will be found that in many cases it is accompanied by a small and unobtrusive staircase, which actually provides the principal communication between the ground and the first floor, the "perron" or external staircase being reserved for entrance and exit on important occasions only. It is an important architectural element designed for a crowd and suitable only where many people are using it.

External staircases are very varied in form. Broadly speaking, they consist of straight flights forming a direct approach as at St. Paul's Cathedral in London, the Madeleine in Paris, and many Roman temples. Secondly, of straight flights, parallel to the face of the building as at the Mansion House, London, the Capitol at Rome, and the Palais de Justice, next to the Place Dauphine, Paris (Fig. 1). Thirdly, of those which are a combination of both these forms, as at University College, Gower-street, and fourthly, of stairs which are of special shape and design, as in the Great Court of the Cheval Blanc at Fontainebleau (Figs. 2 & 3). In all these cases it is necessary that the slope should be flat and the landings wide and numerous; nothing is more disagreeable than an external staircase with narrow landings, steep risers and mean approaches.

When occasion justifies its use, however, the "perron" is a magnificent feature. It may be enriched by groups of sculpture, balusters, podium walls and other adjuncts; the famous Giants' staircase of the Ducal Palace in Venice (Fig. 4) is a case in point, being a direct approach of considerable height, with two splendid figures at the top which give it a most monumental effect. Or, again, there is the great staircase, almost becoming a ramp, at the Capitol at Rome, the motif being similar to that in the design of the Giants' staircase at Venice, the colossal statues at the top representing Castor and Pollux.

Of much greater breadth and relative importance, but otherwise a "perron" of the same type, is that found in the Old Museum at Berlin, the groups of sculpture in this instance being particularly fine. The simpler treatments in our own city, at St. Paul's Cathedral and the Royal Exchange, are without their architectural interest. It is obvious that such a treatment requires substantial depth in front of the elevation of the building, and this depth is not always obtainable. We get, therefore, the steps which rise parallel to the face of the building and may have one of two different treatments:—

(1) They may commence at the extremities and rise to a central landing.

(2) They may commence in the centre and rise to landings at each end.

The Mansion House is a minor example and the Senators' Palace in the Capitol at Rome an important example, of the former treatment, while the Fountain Court at Fontainebleau is an instance of the latter. Sometimes the height from the ground to the principal floor is such that it is not possible to reach it in one flight, and in these cases a staircase of special character is necessary. London, again, provides instances at the National Gallery and University College, both by William Wilkins, and Paris has the external stairs of the Palais de Justice, designed by François Duc, as a portion of the façade. An internal example of somewhat similar character is a portion of the original work by Hardwicke at Euston Station.

The curved staircase has rarely found favour in England, but in France its ingenuity always appears to excite admiration, the most famous being, perhaps, the Cour du Cheval Blanc at Fontainebleau. At the

owever, the curved form is more suitable r the ramp which is required to take traffic, , for example, the Horseshoe Ramp at the ew Louvre in Paris (Fig. 5) and the Ramp the Opera House. The difficulties of deal- g with ramps on curves are emphasised by e latter example, which is rarely used on count of the difficulties experienced in unting by vehicular traffic. There are ny examples of the use of a few steps to e from the ground to the ground floor ich have been made the basis of an effec- e exterior design. These call for no special

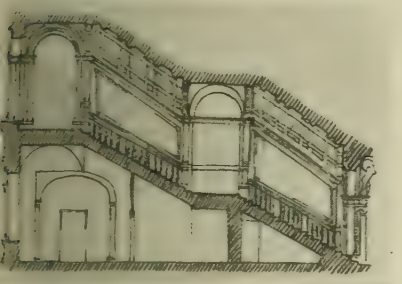

Fig. 10.—Scala d'Oro, Venice.

ervation, the only difficulty which will, babbly, be encountered is the necessity for ple space. All external stairs require ce, a fact which should never be for- ten.

nternal staircases have called for the atest possible variations in design. Their cing in the composition is of great im- tance, as is also their architectural effect. is necessary that they should be:—

1) In the centre of the part of the build- to be served.
2) Easily seen.
3) As far as possible rising through all rs of the building in one enclosure.

Monumental staircases which, by their im- ance, must be reserved for the use of one at the most two floors are exceptions to third necessity of staircases.

hen there is more than one staircase in uilding the lateral communication be- n each and the others should be obvious direct. Internal staircases may be clas- d in three groups:—

) "Show" staircases of monumental arance and effect, rising usually from the nd to the first floor; beautiful luxuries h must be used with care and discretion.
) Principal staircases of various grades importance.
) Service stairs.

1.—Staircase at Audley End, Essex.

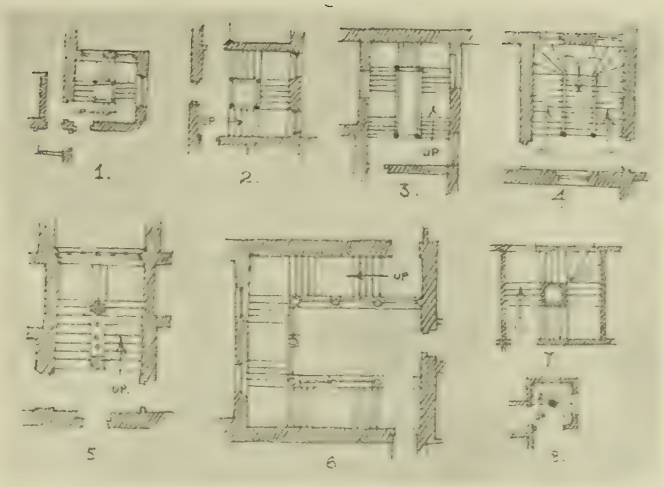

Fig. 12.—Staircases by John Thorpe.

Staircases of all grades must often lead from a landing of departure to one or more landings of arrival by a revolution of the stairs. Thus the landing on each floor level is immediately over the one below, but, at times, monumental stairs and perhaps others

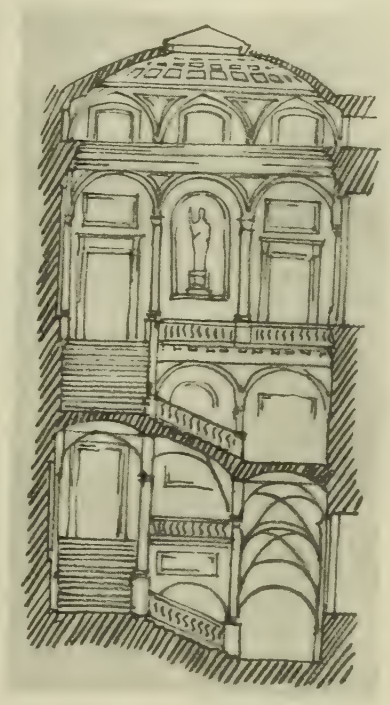

Fig. 13.—Staircase at the Palazzo Braschi, Rome.

of less importance start at one point on plan and land at another which is far distant. The important points, therefore, in the planning of stairs may be summarised as follows:—

(1) Their placing in regard to the plan.
(2) To provide landings where required.
(3) The arrangement of treads and risers of good proportion.
(4) Adequate natural lighting.
(5) Ample but not extravagant width.
(6) Effective design.

In monumental buildings the main or "show" staircases often become structures in themselves. There was a magnificent stair of this character, known as the Staircase of the Ambassadors, at Versailles, and the main staircase at Hampton Court almost rivals it in importance. In such staircases the design is made primarily for effect, and where it is in a staircase hall both ground and first floor will be included in its height, a ceiling covering both and providing a staircase hall of monumental proportions. Such stairs must always be spacious.

Landings, according to their respective purposes, must be ample and communicate with the main horizontal corridors running through the building. Top and side lighting are needed, the windows on the side walls facing, if possible, the more important flights. The shapes created by the line of the stairs on the wall surface bring into existence problems in decoration which are not always easy to solve, and considerable ingenuity has, at times, been exercised to create a straightforward scheme which would give the maximum effect. For instance, Garnier in the stairs of the Opera House, Paris (Fig. 6), kept the strings free from the walls and, therefore, had rectangular spaces to deal with.

Not the least of the difficulties of staircase design is that of lighting. Of necessity the landings at each floor level require to be in the centre of the building to assist economic planning, and this, in many cases, forces the intermediate landings to the outer wall, with consequent difficulty in dealing with regular ranges of windows which are features of a classic treatment of a façade.

The demand for beautiful stairs is relatively modern. Ancient buildings appear only to have known staircases which were useful. As the desire for a rich staircase became felt it was first designed as a straight flight with the walls and roof ornamented, but such straight stairs can only lead satisfactorily from one floor to another. Their disadvantage is the amount of space occupied, which is indicated by the plan of one of the stair-

Fig. 14.—Staircase at the Ecole Militaire, Paris.

cases in the Old Town Hall, Paris (Fig. 7). In buildings with narrow wings this was exaggerated, and in the Luxembourg, after rising from the ground to the first floor, it was necessary to return along one of two narrow galleries to enter the rooms in the wing of the building which lay behind the staircase. One of the most beautiful and most monumental stairs of simple character is to be found in the Vatican. In a few cases it is advantageous to land on the first floor at a point distant from the point of departure on the ground floor, but in many other cases this is a serious disadvantage, and as soon as staircases were constructed to serve many floors, the difficulties became almost insuperable.

When monumental staircases are placed so that the flights are parallel to the main façade there is a tendency to double them as in the case of the Odéon in Paris, or of the Convent of the Benedictines at Catane (Fig. 8). Occasionally this duplication is justified by the effect produced, but more often one staircase or the other appears to be redundant. There is a certain fascination about some of the English stairs constructed on this principle, which is felt in spite of their costly character.

Early staircases, even where they rise in several stories one above the other, have walls on either side and a solid roof. Such is the character of the Henry II's staircase at the Louvre, that at Burghley House, Northamptonshire (Fig. 9), and many other cases, notably, the Scala d'Oro at Venice (Fig. 10), but gradually, as staircase planning developed, the designers realised the possibility of obtaining light from floor to floor by supporting the stairs upon strings. At first the newels which carried the strings ran through the whole height of the building, an instance of which is found at Audley End, Essex (Fig. 11), and it was very soon discovered that these newels need only be of sufficient height to carry the handrail, and they were then reduced in size accordingly. John Thorpe exercised his ingenuity in planning stairs, some of which show unsupported strings while others indicate supports (Fig. 12).

Apart from the detail of design, however, the invention of the stairs with unsupported strings opened up a whole new field of composition, while the construction of such staircases in wood eliminated the need for a costly and elaborate system of arches and vaulting, which is found, for example, in the Palazzo Braschi at Rome (Fig. 13). It is easy to discover the reason for the universal employment of cantilever steps. They are easy to construct, have the greatest possibility of good lighting, and lend themselves most readily to manipulation in relation to the length of flights and the position of landings.

The English appear to have invented the "cut" string so universally employed in the eighteenth and nineteenth centuries, while the French maintain the use of the "closed" string in stone as well as in wood staircases, very fine examples of its treatment being found in many of the important buildings of France. The one illustrated is from the Ecole Militaire, Paris (Fig. 14).

WATERLOO BRIDGE

In reference to the proposal of the Improvements Committee of the L.C.C. to reconstruct and widen Waterloo Bridge, we take the following extracts from a letter of protest which recently appeared in *The Times*:—

"We, the undersigned, being conscious of the unique artistic significance of Rennie's Waterloo Bridge—one of the finest masterpieces in architecture to which our country can lay claim—are yet aware that a purely negative attempt to preserve its identity after the necessary repairs have been effected would be as little likely to meet with success as the similar appeal, made a short while ago, for a reconsideration of the St. Paul's Bridge policy. The very acuteness of the traffic situation in the present instance, however, happily enables the problem of the preservation of the original Waterloo Bridge to be met with a constructive suggestion instead of with one of a dissuasive tendency only.

"Proposals have recently been put forward (and one of them, at any rate, rewarded with universal public approval) for the erection of new bridges within short distance of Waterloo—namely, upstream at Charing Cross and downstream at the eastern end of Somerset House. Both these proposals have been thrust aside in favour of the St. Paul's and Lambeth schemes, neither of whose warmest supporters have claimed a tithe of the merely utilitarian urgency which in the Strand region is reckoned, it would seem, to demand the lasting disfigurement of Waterloo Bridge. But not only do we hold that the exigencies of communication in this area would be more aptly, more permanently, and more economically met by splitting up the traffic and diverting some—preferably the heavier—over a new bridge, than by concentrating the whole of it upon Waterloo (especially without a remodelling of the Strand approaches), but we see in the construction of the proposed temporary bridge an expenditure justified by not the smallest return, and one which either of the above permanent bridges might, given sufficient forethought and expedition, render unnecessary.

"A new metropolitan bridge between Westminster and Blackfriars, in fine, has suddenly ceased to be a matter for public advocacy and enlightened suasion—a promising germinal idea to be gradually matured, enriched, and fortified. It has instead become a question of immediate urgency in which the promptest action is patently requisite. Each of the schemes mentioned above has its peculiar merits, the one for the eastern bridge being perhaps destined to stand in a closer relation to Waterloo Bridge itself, while the Charing Cross proposal is one of incalculable importance to the life and the greatness of London. Our business here, however, is primarily to point out how the brutality of the measure now contemplated, ruthless though it may appear, is altogether equalled by its inadequacy and probably by its ultimate extravagance as well."

Martin Conway	J. St. Loe Strachey
A. Trystan Edwards	Charles Walston

The following, while dissociating themselves from any reference to positive proposals made in the above letter, join in protesting against the threatened vandalism.

Edwin L. Lutyens J. A. Spender

Sir Reginald Blomfield, in the course of a reply in *The Times*, states:—

"The proposed reconstruction of Waterloo Bridge is undoubtedly a matter for the gravest consideration, but I venture to suggest that the protest appearing in *The Times* has rather overshot the mark. Apparently signatories wish to repair the bridge, and le it as it is, and to construct a new bridge, or new bridges, 'upstream at Charing Cross downstream at the eastern end of Some House.'

"In regard to repair, the cause of the su dence in the pier between the fifth and si arches is the increased scour due to the Emba ment, which has gradually washed away bed of the river round the foundations. W has happened to this pier may happen to the and I am informed by the engineers that various reasons it is impracticable to deal the pier as it stands, and that the only co open is to reconstruct the bridge. If that i it might be an immense gain from the poi view of public convenience to widen the br and the question then arises whether this would outweigh the possibly injurious effe would have on the architectural value of bridge. It is, of course, taken for granted if widened, the existing granite façades arches would be re-erected stone for stone new work being in the centre. This pro is a serious matter, but to talk of it in terms as 'ruthless' and 'brutality' does help things much.

"As to the proposed new bridges, desc by the signatories as 'a promising germ idea,' a bridge between Waterloo and Blackf would be useless, and the Charing Cross sc has been familiar for years, and has been st ously advocated by many of us, but the n sary data of cost, alignment, and the other d of so vast an undertaking are not yet avail and till they are, it seems rather futile to ag about this 'germinal idea.' Meanwhile, L traffic has got to get across the river some and neither Waterloo nor Lambeth Bridg wait for Charing Cross. The signatories s in disparaging terms of the 'merely utilit urgency' of Lambeth Bridge. They do seem to realise that Westminster Bridge, w it has to relieve, was designed before the of heavy and speedy motors, and that, wh it is, it is inadequate for the traffic that passes over it.

"It goes without saying that we are all ag and have been for generations, as to the sup architectural quality of Waterloo B Personally, and from the æsthetic point of I believe it to be the finest bridge ever built I would suggest that before these violen not quite intelligible protests are issued, inquiry should be made into the actual In the absence of this knowledge, this p seems to me to be beating the air."

Mr. Andrew T. Taylor (Chairman Improvements Committee of the London Council) stated in the Press recently it was only from sheer necessity and with regret that the Improvements Committee London County Council decided on the they have taken. No member of that mittee would consider any tampering wi beautiful bridge had it not been for the put before them by their Chief Engineer, n that the bridge was in a dangerous conditi that in view of the safety of the public steps must be taken without delay. Th mittee had no alternative but to report t bridge must be taken down and rebuilt. felt that the dislocation of traffic would great for the bridge to be closed. In cons the proposed widening it had to be reme that it was only 42 ft. 6 in. wide; while friars Bridge was 105 ft. wide and other bridges were also wider. He could not c of anyone seriously urging that this should be re-erected only 42 ft. 6 in. wide, of present and future traffic.

Housing Costs, 1924-25.

The Ministry of Health's estimate for during 1924-5 is: Housing grants £8,05 decrease of £597,500 on 1923-4.

Royal Masonic School Competition.

We give this week the design submitted in e recent competition for the Royal Masonic stitution School for Boys, Bushey, by essrs. H. T. Buckland & Wm. Haywood, F.R.I.B.A. The estimated cost was £240,377 th an additional £3,500 if covered ways were ovided for communication.

The design placed first by Messrs. Davis & nanuel and Henry C. Smart was given in our ue of February 22.

The design by Messrs. Gotch & Saunders, P. d F.R.I.B.A., with S. C. Kirby, A.R.I.B.A., as given in our issue of February 29.

Palais de Danse, Croydon.

This building was specially erected for its rpose. The front elevation is in "Atlas hite" cement on brickwork. The interior s a maple sprung dancing-floor, black com-sition jointless flooring for the surround, corative fabric wall panels, fibrous plaster lumns and pilasters. Concealed lighting is ed throughout; the light, emanating from hind the cornice, is reflected on to the ceiling, thout a single naked lamp being visible. The chitect has endeavoured to produce the grace d purity of the Greek outline without its companying severity, and the atmosphere of iting comfort so essential to a building of s nature. The question of economy had of cessity to be considered, and the lowest nder works out at about 1s. 5d. per foot cube. . H. Victor Kerr, L.S.A., is the architect.

"Conway," Byfleet.

This house is now nearing completion. vantage has been taken in the planning and -out of a natural fall in the ground. The terials used are local bricks, and the roof is ered with antique tiles. Mr. Gerald Warren, S.A., is the architect, and the builder Mr. G. Tarrant, of Byfleet.

Coventry Colliery Housing Scheme.

The houses (illustrated on pp. 544–547) are ng erected on the outskirts of Coventry adjoining the new Coventry Colliery in parishes of Keresley and Exhall. The tractors engaged on the construction of the ses are Messrs. H. Clarke & Sons, of nation-road, Coventry, and Messrs. Pearson Burden, of Coventry. The sub-contractors ployed are: Electric wiring, Burbury & Co., entry; slating and tiling, Wormells, Coventry; grates, baths and sanitary fittings, Messrs. Cornes & Haighton, Messrs. Parker, Winder & Achurch, Ltd., and Messrs. W. E. Farrer, Ltd.; steel casements, The Crittall Manufacturing Co., Ltd.; street works and sewers, Messrs. Kelley & Son, of Coventry; the main electric cables are being laid by Mr. R. M. Russell, of Glasgow, to the specification of the consulting electrical engineers, Messrs. Mountain, Son & Wood, of Newcastle-on-Tyne. Mr. S. J. Oldham, M.S.A., of Coventry, is the architect.

WAGES AND UNEMPLOYMENT

There is much worthy of consideration in the discussion at the Conference of the League of Nations Union on Unemployment. Mr. G. N. Barnes expressed the view, as reported, that, having regard to the present world conditions, except in a relative sense, hours and wages had little bearing on the question of unemployment, and he pointed to countries where long hours were worked but yet there was unemployment, notably Germany. He, however, recognised that continual employment depended upon the largest production of goods, regard being had also to demand. High wages and short hours are compatible with large production, and the above statement must be qualified by this consideration, and Professor Bowley made this point clear when he said that the practical problem as it appeared to him was to obtain 54 hours' product for 48 hours' labour.

Professor Bowley also observed that he supposed it was too late in industrial history to lay stress on the obvious fact that the balance between wages and leisure would vary greatly as among individuals, according both to their temperament and their needs, since a common rule in an industry had inevitably become very general. This is a fact lost sight of by the wage earners as a class. The professional classes and the masters of industry have no fixed hours and work as occasion demands, and the wage earners fail to appreciate the fact that this is the reason that they are not mere wage earners. Intense application and unlimited hours of work have placed them in the position they occupy, and a slavish adherence to trade union rules has formed no part in the progress of the master of industry towards the position he occupies.

Both Mr. W. L. Hichens and Mr. P. J. Pybus laid emphasis on the point we have always urged in these columns, that it is the world's trade we have to consider, and it is that which must in the long run dominate industrial conditions in this country, and we cannot be parochial in our economic conditions.

Mr. Pybus pointed out that the export trades have to produce to meet the world price and the remuneration of the worker must be governed by that price, but the group immune from foreign competition calculated what it considered a fair rate for labour with no international check whatever on the efficiency of the labour, and this created an obviously improper difference between the standard of life amongst workmen doing precisely the same kind of work in the two great groups, and he instanced the case of the fitter in the railway workshops who was in receipt of 16s. more per week than a similar workman engaged in the export group, and he pointed out that the selling price in the export groups was determined by principles which were economically sound, whereas in the protected groups the method was economically unsound.

This is a most important point, and it must be observed that it is the group whose remuneration is fixed on uneconomic principles which is the most restless and apt to resort to the strike to intimidate the public. In the protected groups it is sometimes urged that speeding up is a ground for demanding increased pay, but this must depend upon whether speeding up shows increased revenue to the undertakings. Speeding up which results in greater output or greater revenue may well be a ground for increased wages, but it is a characteristic of the protected groups to demand increased pay without any regard to the results obtained by their industry. The equalisation of the standard of wages and living between the two groups is the problem of the day, and both Mr. Hichens and Mr. Pybus laid great stress upon this.

Besides this there is the question of the world's trade to consider, and Mr. Hichens expressed the view that the lower wages paid per unit in other countries was the main, though not of course the only cause of our inability to compete in prices, whilst as regards hours of labour, the principle must be accepted that it was the duty of everyone to work as long and as hard as he could to contribute as much as possible to the national wealth; when the emergency was past the demand for leisure would rightly come to the fore again.

These are truths which we have repeatedly put forward in these columns. It is extraordinary that a nation which has performed prodigies in the war should have relapsed into a condition of apathy after the war is won, before it has consolidated its position in the peace. Artificial standards of living are set up, and wages are demanded to attain them regardless of the fact that after a great war the standard of living, following on the depletion of capital, must of necessity be lowered. Every increase in wages forces up the standard of living, and if it takes place in an export trade drives away trade which is not plentiful but which has to be bid for in the foreign market.

OBITUARY

Mr. Charles Sebastian Nelson, of Leeds, died recently on his 80th birthday. He was a member of the firm of C. S. Nelson & Birkinshaw, Articled in Bradford as an architect, he commenced business in offices in Park-row, Leeds, where Beckett's Bank now stands, and although there had been several enforced removals Mr. Nelson never left Park-row, where he was in practice for between fifty and sixty years.

The death, at the age of fifty-seven, took place recently of Mr. H. J. C. Cordeaux, F.R.I.B.A., of the firm of Cordeaux & Farrow, East London, Cape Colony.

We regret to announce the death of Mr. William Frowde Young, F.R.I.B.A., of 12, Norfolk-street, Strand, W.C.2, which took place suddenly at his residence early on Thursday last week. Mr. Young was a student at the Royal Academy Schools, entering about the year 1890, and practised for thirty years as an architect and surveyor. He was the architect for a building scheme at Abingdon, and domestic work at Crawley, Dorking, Shirley, Hayes and various other places. He became a Fellow of the Institute in 1904, and practised up to the day before his death. His funeral took place at Brockley Cemetery on Tuesday last, and was attended by many personal and professional friends.

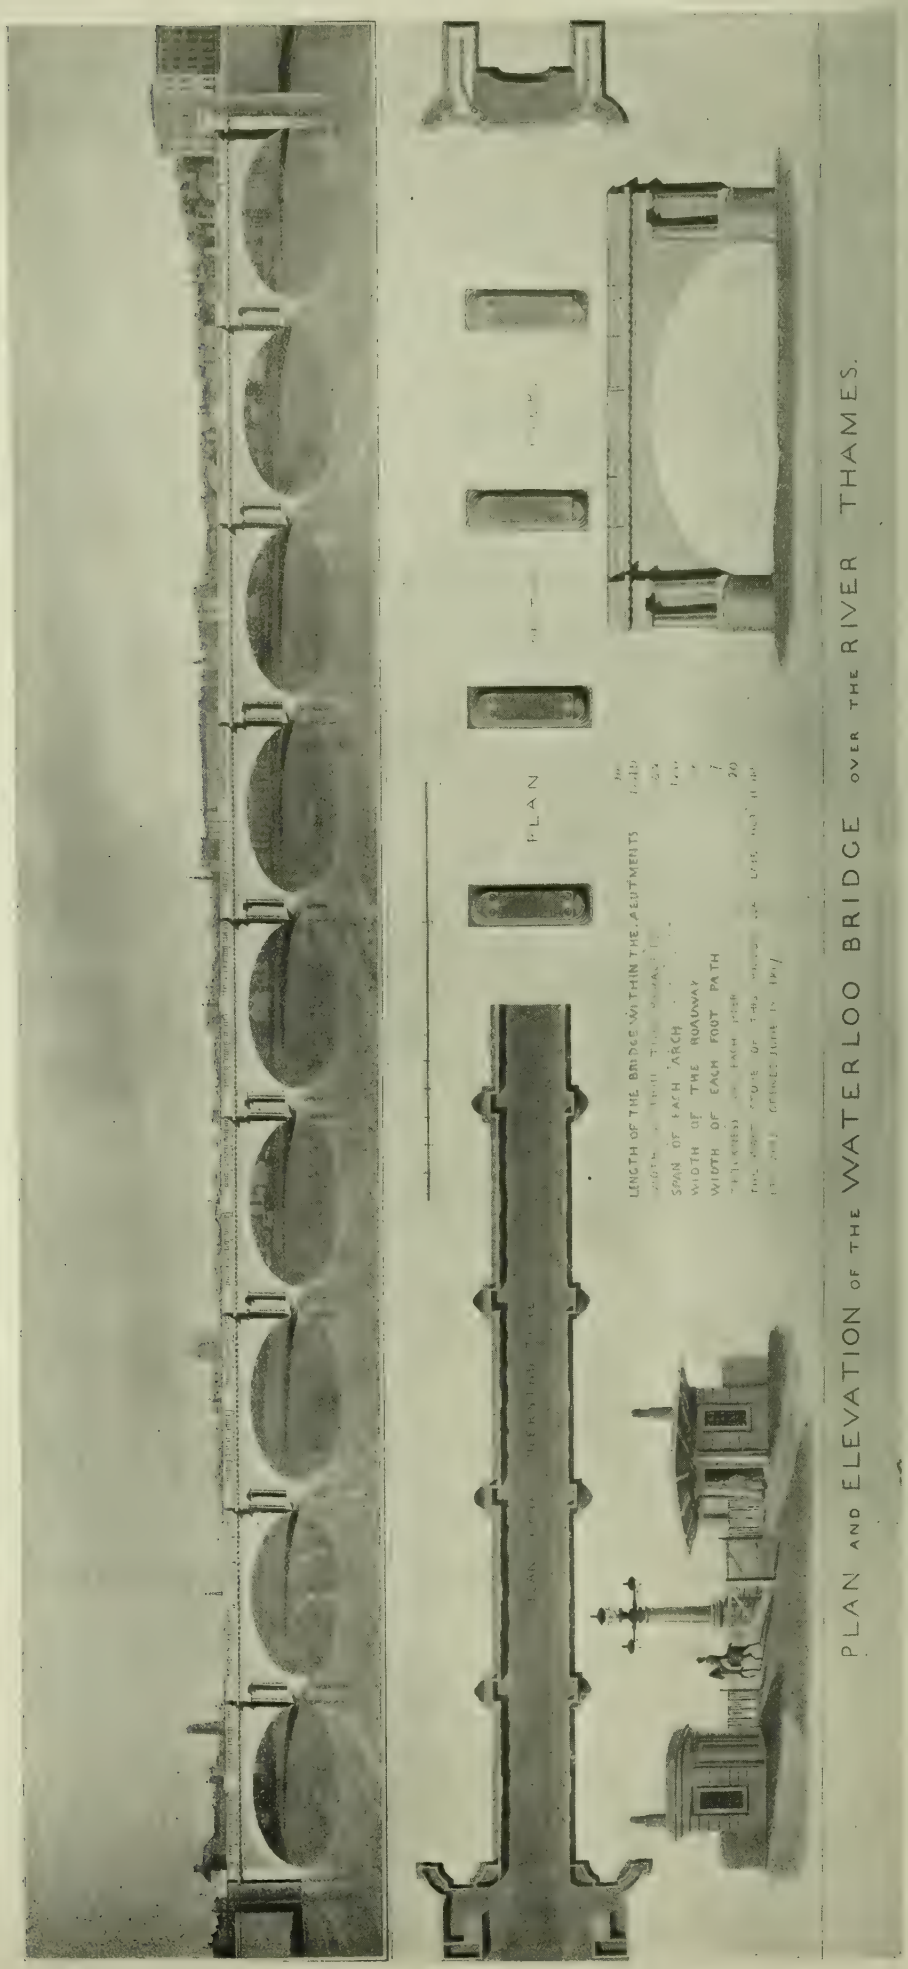
MEETINGS.

Friday, *April* 4.

Royal Society of Arts.—Mr. G. M. Booth on "The Amazon Valley and Its Development." At 18, John-street, Adelphi, W.C.2. 4.30 p.m.

Monday, *April* 7.

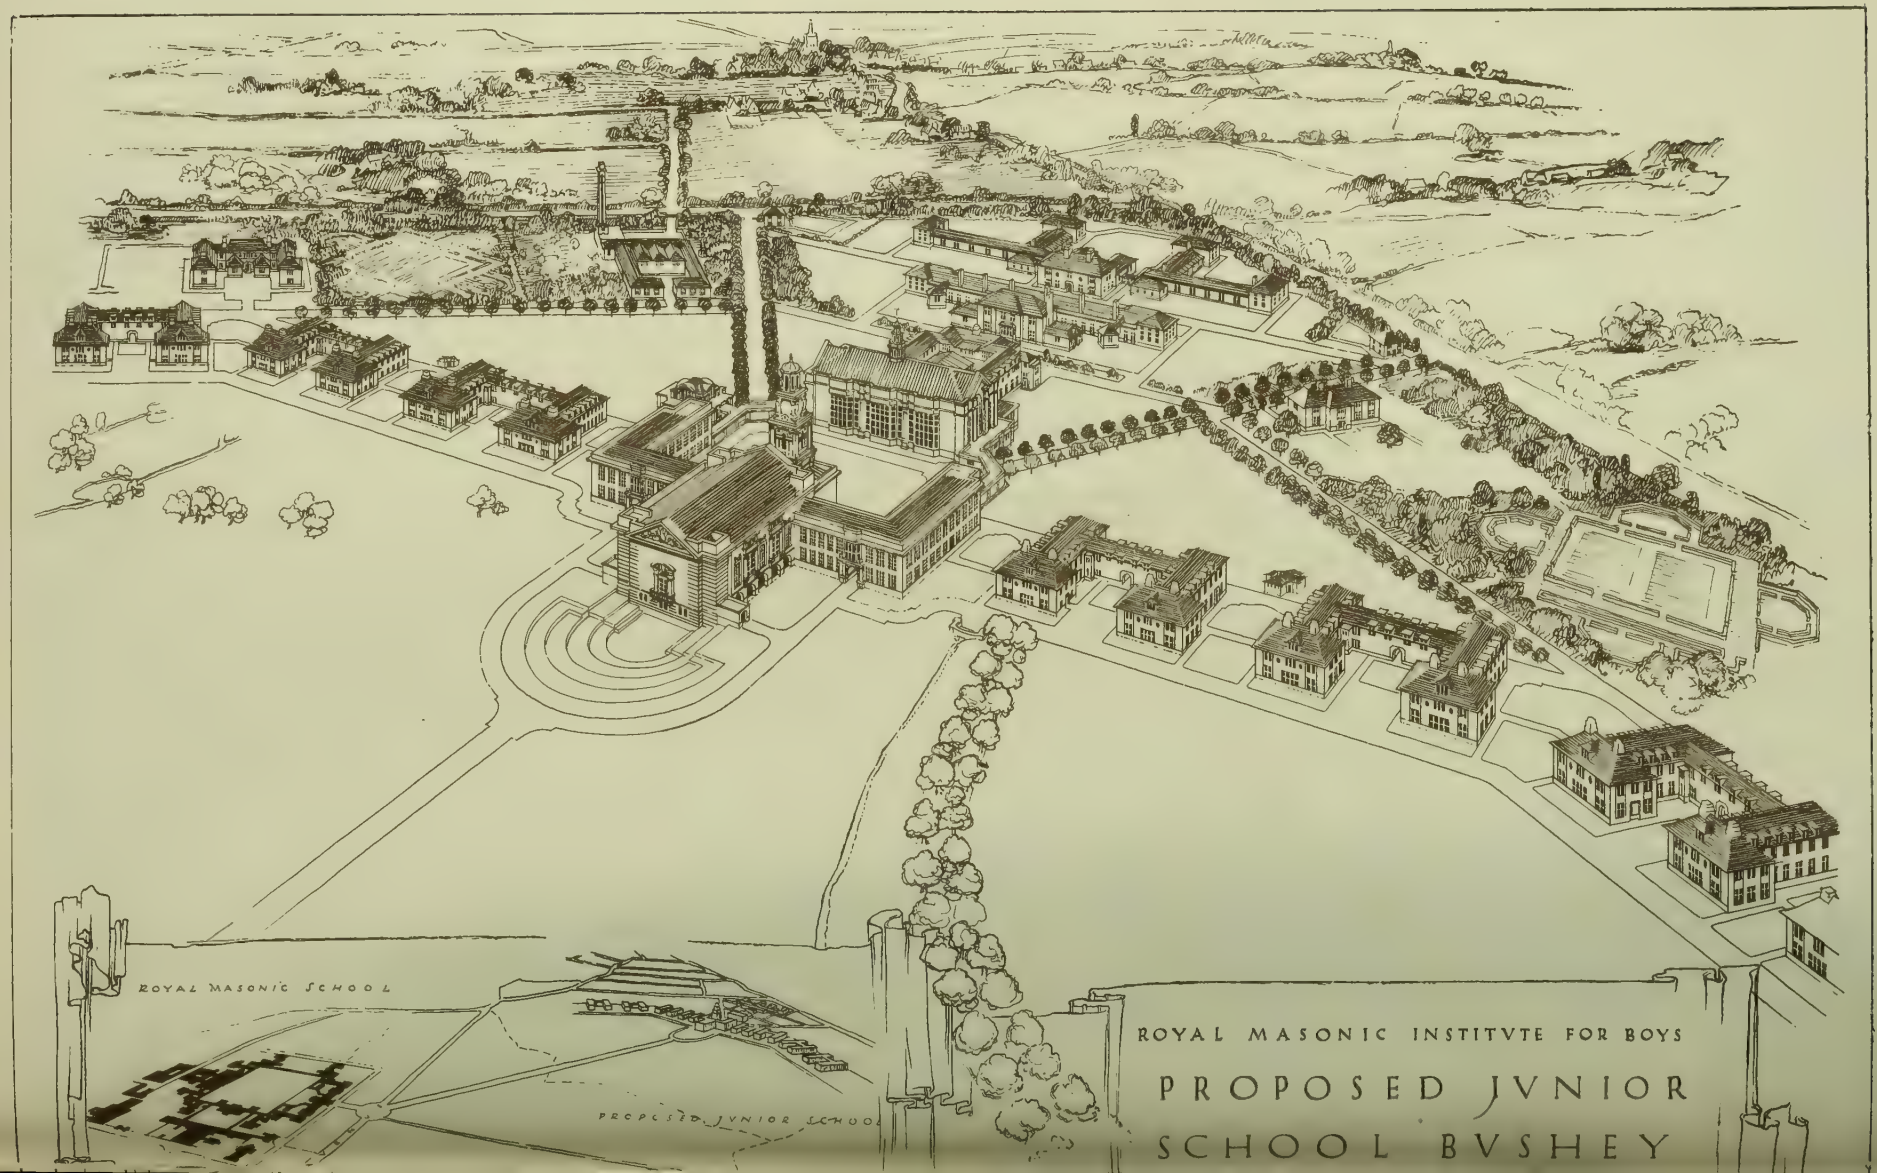
Architects' & Surveyors' Assistants' Professional Union.—Mr. H. R. Sayer on "Municipal Engineering Quantities." At 92, Victoria-street, S.W.1. 6.30 p.m.



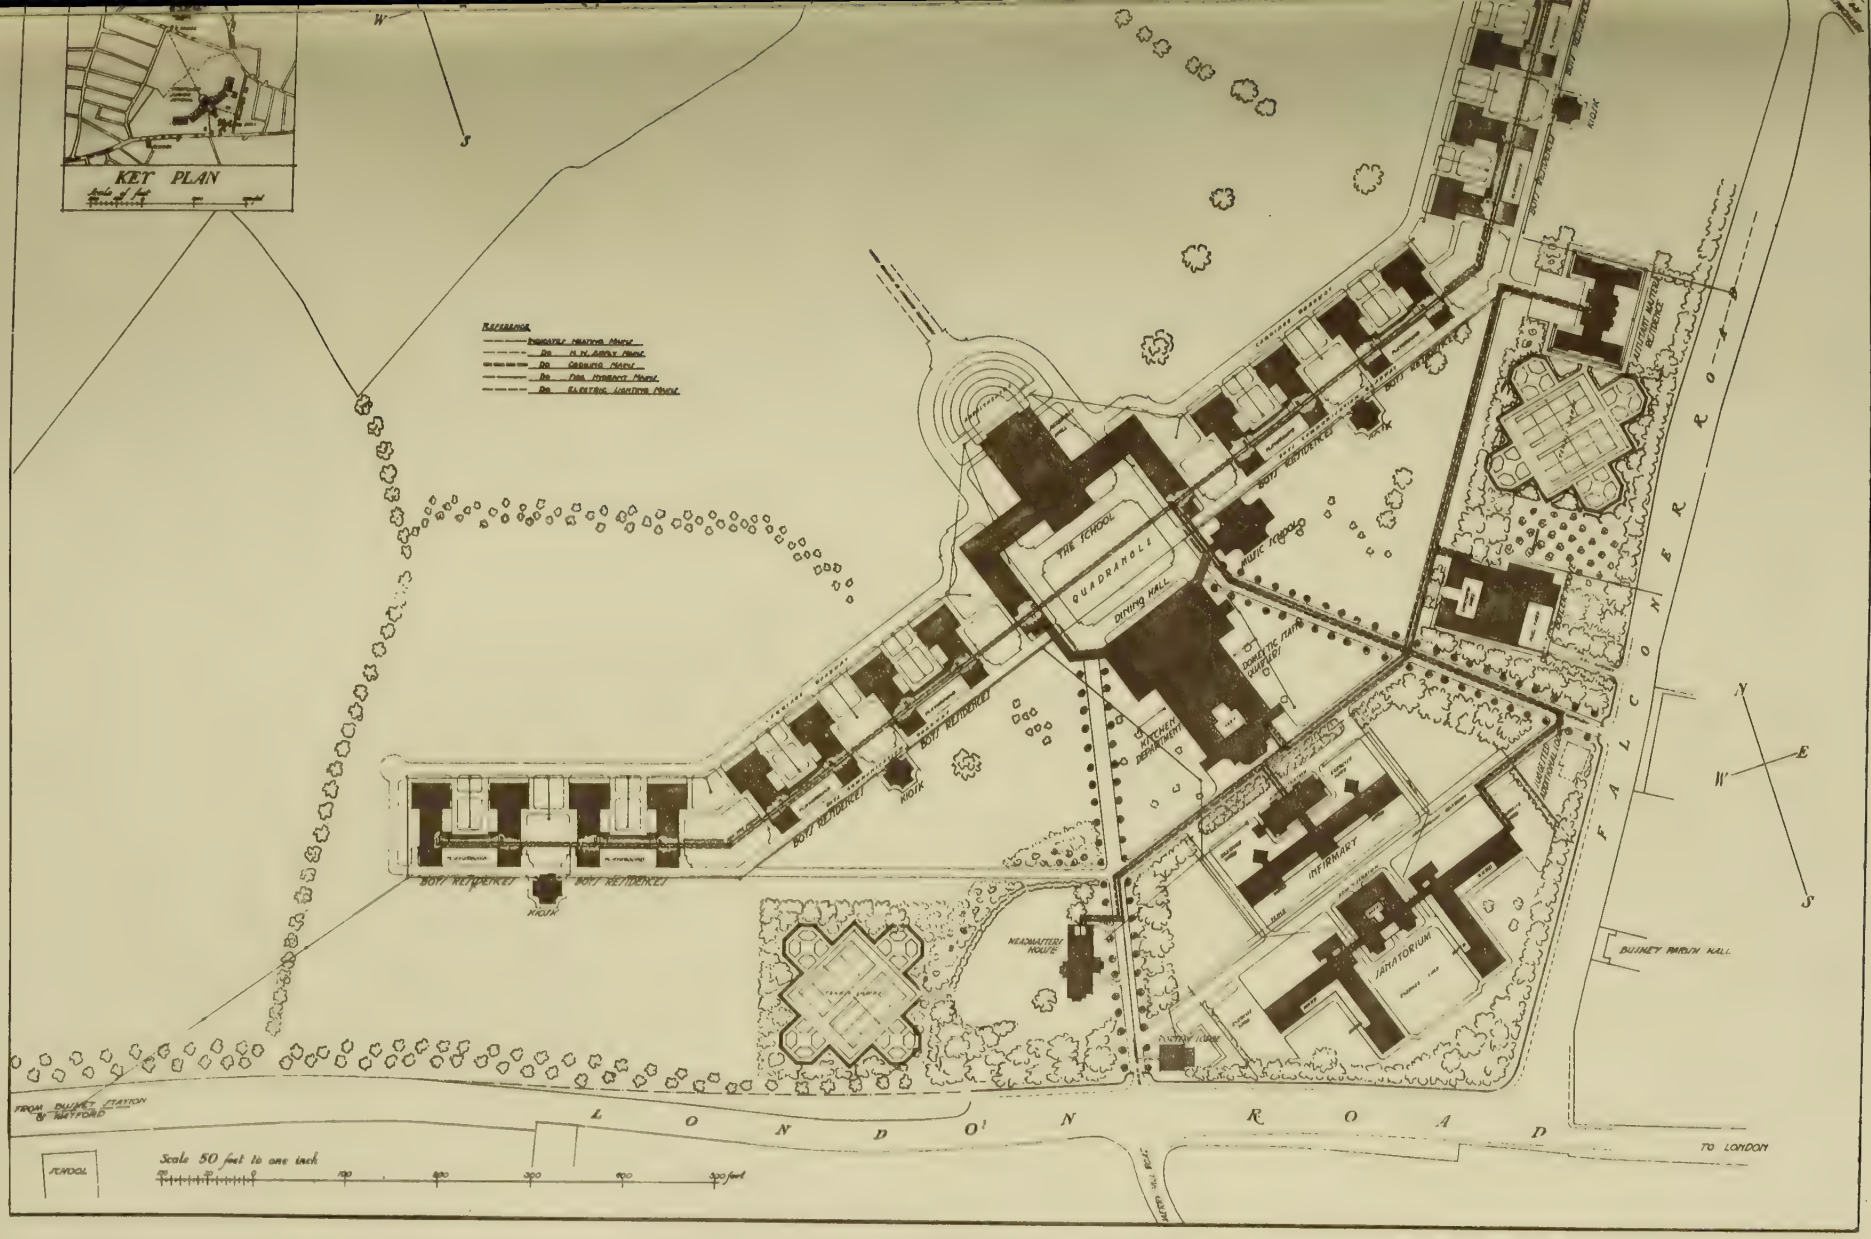
Surveyors Institution.—Mr. C. H. J. Clayton on "The Place of Arterial Land Drainage in Agriculture." At 12, Great George-street, S.W.1. 8 p.m.

Tuesday, *April* 8.

Surveyors Institution.—Annual Dinner. At the Connaught Rooms, Great Queen-street, W.C.2. 6.30 p.m.



Thursday, *April* 10.



Society of Antiquaries.—Ordinary Meeting. At Burlington House, Piccadilly, W.1. 8.30 p.m.

Rennie's Waterloo Bridge.

THE BUILDING TRADES EXHIBITION

THE Building Trades Exhibition is to be opened at Olympia by the Right Hon. John Wheatley, M.P., Minister of Health, on Friday, April 11, the chair to be taken at 12 noon by Mr. J. A. Gotch, President of the Royal Institute of British Architects. The Exhibition promises to be of considerable interest, and in order to provide our readers with a ready and convenient means of reference to the position of Stands, we give below a full list of exhibitors and their Stand numbers, and on the reverse side, plans of the main and new hall. For visitors' convenience we give it as a loose supplement.

A

Acme Ladder Co. (Stand No. 173, Row J).
Adamite Co. (Stand No. 98, Row E).
Adams, Robert (Stand No. 58, Row D).
Aeronautical and Panel Plywood Co., Ltd. (Stand No. 183, Row H).
Aerostyle, Ltd. (Stand No. 122, Row F).
Alabastine Co. (Stand No. 138, Row G).
Alexander & Co., Ltd. (Stand No. 221, Row L).
Allan Taylor & Co. (Stand No. 268, Row O).
Allen-Liversidge, Ltd. (Stand No. 292, Row Q).
Anderson Grice Co., Ltd. (Stand Nos. 256, 257, Row O).
Anderson & Sons (Stand No. 118, Row F).
Anti-waste Appliances, Ltd. (Stand No. 235, Row M).
"The Architect" (Stand No. 103, Row E).
Architectural Press (Stand No. 94, Row E).
Art Metal Equipment Co. (Stand No. 108, Row F).
Ashley Trading Co. (Stand No. 124, Row F).
Associated Crafts, Ltd. (Stand No. 274, Row P).
Australia Concrete Machinery Co. (Stand No. 125, Row F).

B

Baldwins, Ltd. (Stand No. 306, Row R).
Banger, Henry (Stand No. 264, Row O).
Barnett, H., & Co. (Stand No. 73, Row D).
Bath Artcraft, Ltd. (Stand No. 162, Row H).
Batsford, B. T., Ltd. (Stand No. 86, Row E).
Bayley & Halstead (Stand No. 319, Row S).
Beaver Board Co., Ltd. (Stand No. 307, Row R).
Bellman, Ivy & Carter (Stand No. 113, Row F).
Bell's Poilite and Everite Co., Ltd. (Stand No. 279, Row P).
Birnwell Iron Co. (Stand No. 14, Row B).
Bland, J. W., & Co. (Stand No. 300, Row Q).
Blay, George (Stand No. 320, Row S).
Board, John, & Co. (Stand No. 174, Row J).
Boby, Wm., & Son (Stand No. 99, Row E).
Borst Bros. (Stand No. 308, Row R).
Bowden, Wm. (Stand No. 22a, Row B).

WESTMINSTER ABBEY RE-EXAMINED.—II

By W. R. LETHABY.

HENRY THE SEVENTH'S CHAPEL AND THE KING'S MASTER MASONS.

"1502.—*This year in the month of January was the Chapel of Our Lady, standing at the east end of the high altar of Westminster, pulled down; and the tavern of the Sun there also standing with other housing; and the foundation begun of another chapel at the costs of the King*" (*Kingsford, "Chronicles of London," p.* 258: *the date is* 1503 *in modern reckoning*).

My purpose is less to describe what still exists than to discuss what Henry VII's chapel was like when first completed. This chapel, one of the latest of our mediæval works, is also one of the most perfect buildings ever erected in England. It is profusely decorated because it was customary at the time it was built to panel and fret all surfaces, but beneath this system of surface patterning the structure is amazingly frank and energetic. It was clearly seen as building, although it was finished as a sort of cabinet work of stone cutting. The work has always been acclaimed as a masterpiece, even during the dangerous reactions of the generations directly following that in which it was erected. This is well shown in Norden's description (MS. Harl., 570). This, I believe, has never been fully printed, and as it is the longest piece of early building description known to me I give it here from the manuscript. Original spellings are in italic:

"*The new Chappel by whome it was buylded and of the admirable bewtye therof.*"—There is adjoining unto this famous temple, in the east end thereof a chapel erected by H. 7, the beauty and curious contrived work whereof passeth my skill at large to set down so curious and full of exquisite art it is both within and without. And which is not least to be considered the foundation is most artificially proportioned and it showeth most exquisite invention and skill in the builder, for the foundation is the guide to extract a formal and artificial work. Out of this curious foundation groweth, as Leland saith, *miraculum orbis*, the wonder of the world. In regard of the most curious and artificial workmanship thereof, whereof I dare not wade too far in, describing the beauty and form thereof, lest my skill failing me I be forced to retire without performing what I began. Only this much I dare to adventure to report that whoso beholdeth the exterior parts with due consideration of every matter of singular art, will consider it to be a work whereof (be he never so wise or eloquent) he cannot sufficiently demonstrate every particular point of beauty that therein may be noted. But beholding with judgment the body and internal glory he shall find it so admirable both in the *vautinge on the roofe* in regard of the curiosity of work as also in the proportion. And the walls, windows and the rest so exquisitely performed that he will deem them to be the only rare work in the world and as Leland says *the wounder of the worldes*.

"This mirror of *art and architect* is not only in itself beautiful, but it is also beautified with many rare and glorious monuments and curious sepulchres of kings and queens, among whom the founder lyeth, Henry 7, under a most royal tomb framed and most artificially formed wholly of brass richly laid over with gold which now seemeth something to have lost the beauty."

The uncertain use of the new and grand word architect may be noted, but what interests this contemporary of Shakespeare is invention, contrivance, skill, curious and artificial workmanship.

According to Stow, the Chapel was built of stone brought from Huddlestone, Yorkshire, but Wren says "it was performed of tender Caen stone." Neale is probably right in saying that the springers of the flying buttresses were from Huddlestone and the superstructure of Caen stone. Original work fortunately remains in the "Well" between the west window and the great church. This west window is an exceptional work fifteen lights wide and delicately wrought; even on the outside the cusps have terminations of roses, &c. (Fig. 1). Within, the side compartments have a crocketted label added to the tracery and the transomes (as throughout) have little battlements. Neale states that "all the windows except those at the west end were rebuilt and reglazed during the late repairs."

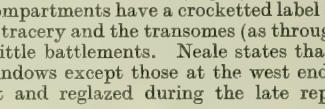

Fig. 1.

A few stones of the original exterior have been found re-used with the wrought face inside, and these show the sharpest and most minute cutting.

There is something wrong with the upper parapet and its row of tall, lean pinnacles. Neale says: "The design for the present parapet was furnished by Mr. T. Wyatt; yet there is strong reason to believe that it bears very little resemblance to the original battlement, which had been entirely destroyed long before the commencement of the late repairs. . . . The whole is terminated by elevated pinnacles, the crockets and finials of which were partly designed from some remnants of ancient ones found among the rubbish; but as they now stand without any merlons between them they are decidedly too high. In some old prints the battlement appears as though perforated by a twofold range of openings. . . . Above the coping was a sort of pierced merlon with an angular termination in the centre."

Carter had collected authorities on this question in the *Gentleman's Magazine* for 1811. The tomb of Prince Arthur at Worcester has such jutting gabled forms in its parapet and the whole tomb has so much in common with Henry VII's Chapel that it may have been designed by the same master. Mr. Sydney Lee had a drawing of Wren's time which showed a bay of the Chapel with the statues and parapet. The parapet of the eastern Chapel at Windsor follows the same tradition (Fig. 2). Those which crown the western towers at Westminster (*c.* 1740) are so like that at Windsor that both seem to have been inspired by the same prototype. At Henry VII's Chapel, however, there seems to have been only one gabled form to a bay.

Again from the old prints it is evident that the pinnacles at Westminster were surmounted by vanes. In the finishing of old buildings there

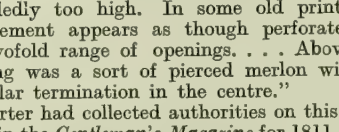

Fig. 2.

were imaginations and a gay play element which are almost impossible for us to think back. A large number of gilt vanes seem to have been one of the ideals of the Tudor time. We know that the King's beasts on the pinnacles of St. George's Chapel supported a similar series of vanes. Some illuminations in books suggest that buildings were stages to carry vanes! Flashing as they turned, they gave a building a sort of life.

The octagonal turrets which surround the aisles housed a large number of statues: three in each of the side turrets and four in those around the apsidal end. They were removed about 1712, but there are names carved on labels attached to the pedestals that once supported them which, so far as they are authentic, show whom the images were intended to represent.

Mr. Micklethwaite, who collected the names (Archæol. xlvii), remarked: "The selection has a very modern look and there seems to be no system of arrangement. Apostles, prophets and kings are all mixed up in the most co plete confusion; but the apostles and ev gelists are all there, as are the greater lesser prophets. For the rest the sole qu fication seems to be that they should mentioned in the Old Testament." On other hand they are all of "holy men old." The kings were, I think, ancest of the Virgin, appropriate to a Lady Cha and care was taken to spread the var classes so that apostles, prophets and ki should not come together. Even the th Hebrews of the fiery furnace did not app as a group in the three niches of one tur but all were separated. The appearance these three, with their names as in *Benedicite*, suggests indeed that the thou behind the sculptures was: "O ye holy humble men of heart, bless ye the Lord. Ananias, Azarias, and Misael, bless ye Lord: praise him and magnify him for eve

The creatures which project at the cor of the turrets and run down the slopes of buttresses are not mere "grotesques," t are the King's beasts.

The structure in its essence is a mausole chapel. According to the original arran ment Henry VII was to have had his to and brazen chantry with its special altar the middle between the stalls, and Henry Sixth, made a saint, was to occupy the east radiating chapel (see *Gleanings*). Marga the King's mother, lies in the southern a chapel, which, as the imagery shows, intended for her, and it was probably expe that the King's successor (Henry VIII) wo lie in the northern aisle-chapel, where Qu Elizabeth's tomb now is.

Before the original arrangement of the st was altered by continuing them eastwards, eastward bays of the aisles or side cha opened to the central area by curved scre similar to those in the next bays eastwar like them doubtless having doors. What now think of as the "nave" was thus be occupied by the bronze tomb of the foun The south chapel contained the bronze t of his mother, and the northern chapel wa contain a corresponding royal tomb. T the original arrangement, made the "aisl count for more in the internal space. opened diagonal lines of sight of great v (Fig. 3 is from a plan *c.* 1600).

Even the "nave arches" of the bays w opened into the aisles are different from others and like those of the eastern cha Traces of the screens in these bays may be seen on the piers. The four originally appropriated radiating chapels were al certainly intended for so many more r tombs and chantries. There were thu have been eight such chantries surroun the central altar of the Virgin.

The other main points in the concep must have been: the miraculous vault structed wholly of thin wrought ston triumph of geometry and of stone cu (notice the way in which the springings pierced to allow of sight of the windo the system of support by a series of octag turrets; the bowed windows between turrets; the brazen chantry in the centr the choir of singers; the great congregatio saints; the ornamentation with the K beasts, Lion, Dragon, Greyhound, and Tudor badges, Rose, Fleur-de-lys, Porte etc.; the profusion of undercut carving; tishings to the window transomes; and flood of light through stained windows

The central object of the whole struc the chantry chapel of the King, in bronze about 20 feet long, was an amaz daring thought and a triumphant piec skilled craftsmanship. Several details v have now disappeared are shown in Ho delicate etching given in Sandford's His We should realise that when new it must been dazzlingly bright, as also would been the beautiful gilt bronze entrance of the "nave."

Beneath the clerestory of the "nave" on the walls of the chapels is a great gregation of images of saints, and under a band of angels guarding the King's re

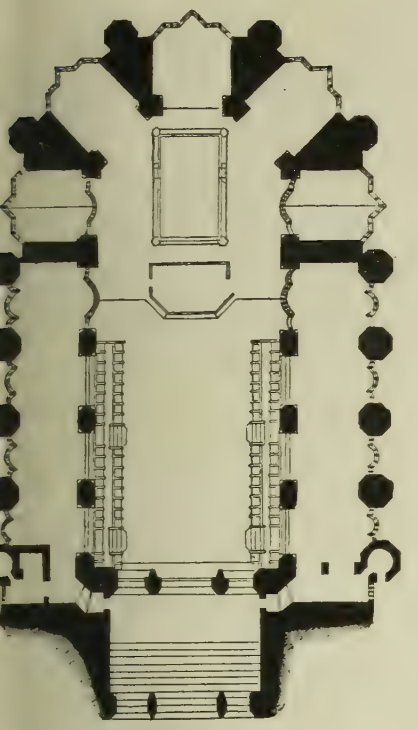

Fig. 3.
Plan from "Gleanings."

ce. That this was one of the root ideas in nning the work is suggested by a passage the King's will:—

"I trust also to the singular mediations d prayers of all the holy company of ven; that is to say, Angels, Archangels, triarchs, Prophets, Apostles, Evangelists, rtyrs, Confessors, and Virgins, and espe-lly to mine accustomed Avouries I call and , St. Michael, St. John Baptist, St. John angelist, St. George, St. Anthony, St. ward, St. Vincent, St. Anne, St. Mary gdalen and St. Barbara. . . ."

Masons.

The structure, begun in 1503, was com-ted in ten or twelve years. In 1506-7 he King's iii Mr. Masons" reported as to cost of the proposed tomb: they were bert Vertue, Robert Jenyns and John bons, and the first-named was probably the ef master in charge of the work. Mr. estlake has recently objected that there is actual proof, and he points out that in the ng's will (1509) Prior Bolton of St. rtholomew's is mentioned as master of the rks. A master of the works, however, was general controller of accounts: Abbot lling was "master of the works" of the ve (Rackham). In the accounts for the nb of the Lady Margaret the Prior of St. rtholomew's is mentioned "for his counsel devising the said tomb and for costs in veying and controlling the workmen at dry times and for sending for workmen ond the sea for making of the said tomb." is was in the fourth year of Henry VIII, the Prior was probably appointed by ry VII in the time of his approaching th. The workmen from beyond the seas e none other than Torrigiano and his panions, and the "Florentine" is men-ed in another passage. All the devising Prior can have done was in the sense of ng down conditions and approving pro-als. Of course every intelligent employer in part the designer of the work he is rested in, but great technical works in sonry can only be designed in the stricter se by a mason. In Neale's day "the dit of designing this chapel" was generally n to Sir Reginald Bray, who seems also have been a master of the King's works, he was one of those who laid the founda-stone of the Chapel.

Correspondences between Henry the VII's Chapel and other works of known craftsmen at Windsor, Eton, Oxford, etc., afford practical proof that one of the three master masons of the King who were consulted on the tomb was the chief "architect" of the Chapel, as naturally would be the case. The vault is a developed copy of the vaults of the Divinity School, Oxford, and of St. George's Chapel, Windsor. By approaching the Westminster work through these we shall be better prepared to consider who was its designer. The Divinity School was erected during the last three years of Edward IV (1480-1483). On the vault is found the monogram of William Orchard, the master mason (Miss Edith Legge, 1924). All that is known of St. George's Chapel is contained in Sir W. Hope's quite perfect account of Windsor Castle. The works at Windsor appear to have been begun as early as 1477, under the direction of Henry Jenyns, King's mason, who may have been a son of the Robert Jenyns who, about 1450, was the master mason of the tower of Merton College, Oxford. Parker remarks in *Gleanings*: "It is on record that the work of the Divinity School in Oxford was suspended for several years in consequence of the skilled workmen being sent for to Windsor by royal writ" (p. 70). Of the relation between Windsor and Westminster, Sir W. Hope wrote as follows:—

"The Lady Chapel built for Henry VII at Westminster, apparently by the same master masons who carried out the work at St. George's Chapel, has towards the east a polygonal apse which is strongly reminiscent of the transepts at Windsor. . . Another feature of the Westminster chapel is the curious series of lofty bay windows that light the side chapels. The prototypes of these are clearly the oriels in Henry VII's tower at Windsor. The masons named in connection with the Windsor work are Richard Nymes and Robert Jenyns. The latter was probably a son or brother of Henry Jenyns, the master mason of the earlier works of St. George's Chapel, and his connection with Westminster is suggested by the fact that he was one of the three master masons who gave estimates for the making of King Henry VII's tomb in 1506-7. Another of these was Robert Vertue, evidently a kinsman of William Vertue who, with John Hylmer, contracted to vault the choir of St. George's, and the Lady Chapel beyond, and by himself apparently set up the fan-vault above the crossing." (This vault, it is added, is dated 1528—p. 586.)

"Robert Jenyns was working upon the King's Lady Chapel at Westminster, and was probably the son of Henry Jenyns, master mason of the work of St. George's Chapel from 1477 to 1484, and perhaps later. The master mason of the Windsor work was undoubtedly the same man who designed the Westminster Chapel and who, after the King's death, began in 1511 the noble mansion-house at Thornbury, in Gloucestershire. He apparently also rebuilt the King's palace at Shene after its destruction by fire in 1497" (p. 247).

Hope had no doubt whatever that the masonry of Henry VII's Chapel was designed by a mason, or of the close relation between it and St. George's Chapel, Windsor. He agreed, also, that the master of Westminster would have been one of the three King's masons consulted as to the cost of the tomb in 1506-7. Without giving any reasons, however, he substituted the name of Robert Jenyns for that of Robert Vertue. In speaking of the three masons as giving "estimates" for the King's tomb Hope may suggest a mistaken view. I should rather understand that they concurred in *one* estimate as to how much a certain project (prepared by a foreigner) would cost. Robert Jenyns, the King's mason at Windsor, might join in a conference as to the cost of a tomb without being engaged at Westminster.

The fact that Robert Vertue is the first named of three King's masons who give their opinion on a Westminster question while the main work was going forward is evidence that he was the master actually in charge.

Robert Vertue is mentioned in the copy of Henry VII's accounts at the British Museum as receiving in 1501, £40 in part payment of £100 for building of a tower in the Tower of London. (Was this the "Brick Tower" on the north side?) Robert Vertue was thus working in London at the very time Henry VII's Chapel was being prepared for. Only the year before this I find Robert Jenyns mentioned in the same accounts as "mason of Windsor." Again, in 1503, £10 was advanced "to Vertue in part payment for a new 'platt' at Greenwich." Later work was done at Windsor itself by William Vertue who was probably a son of Robert. In 1 Henry VIII William was paid £50 in full content for vaulting the chancel of Windsor College. I do not know on what evidence Hope assigned Thornbury Castle (1511) to Robert Jenyns except its obvious resemblance to Windsor.

In the British Museum manuscript room is preserved a drawing on vellum of a tomb in a style very similar to the King's Chapel (Cott. Ang. II, 1). It is lettered in a somewhat later hand, *The Monument intended for Kinge Henry the Sixte*. It is skilfully drawn in a two-sided view that can hardly be called

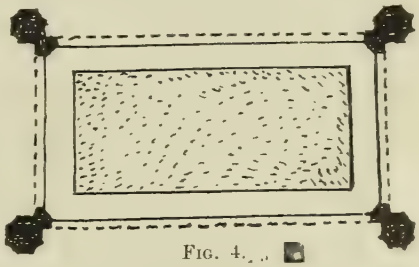

Fig. 4.

perspective and clearly must date about 1500 and be by one of the royal masons of the time. Slender octagonal turrets rise from the angles of the tomb proper. These run up the full height, and are terminated above with ogee curved cappings cut into scales and similar to the turrets of the chapel. Fig. 4 shows the scheme; arches following the dotted lines spring from "turret" to "turret," and above the arches is a tier of rich niches for about twenty statues. It has been said that this stage must have surrounded an upper chantry chapel, but the scale does not allow of this. This range of imagery is again in the manner of the Chapel, and moreover the images were supported on pedestal pillars like the figures of the Chapel. Smaller details like running foliage in the hollow mouldings and rose terminations to the cusps also resemble

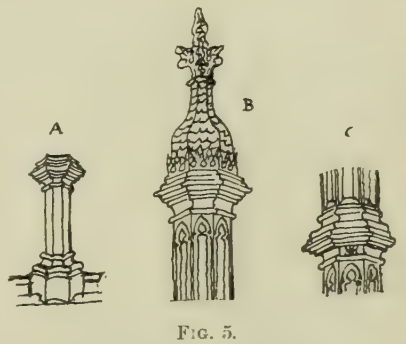

Fig. 5.

details in the Chapel, and I think it is probable that the tomb drawing was by the master mason at Westminster. The supporting "turret" element was a new thing at the Chapel, but it became a great vogue; even the brass chantry has open work octagonal turrets at the angles. In Fig. 5, *A* shows the image pedestals; *B* the tops of the turrets (compare the brattishing to the cornice with that at Westminster); *C* is a band on the turrets (compare those on the brass turrets at Westminster). Altogether I venture to assign this "platt" to the master of Henry VII's Chapel, that is, as I suppose, Robert Vertue.

ARCHITECTURAL SOCIETIES

SOUTH WALES INSTITUTE OF ARCHITECTS.

The annual dinner of the South Wales Institute of Architects was held at Cardiff recently. Mr. Percy Thomas, F.R.I.B.A., presided, supported by the Lord Mayor of Cardiff (Alderman Sydney Jenkins), the Mayor of Newport (Councillor Charles F. Williams), Messrs. J. Alfred Gotch, F.S.A., F.R.I.B.A., President of the Royal Institute of British Architects; Ian MacAlister, B.A., Secretary of the Royal Institute of British Architects; E. J. Partridge, President of the Society of Architects; C. McArthur Butler, F.C.I.S., Secretary of the Society of Architects; Charles Coles, B.Sc., Principal of the Cardiff Technical College; Principal A. H. Trow, University College, Cardiff; Messrs. Gilbert Shepherd, President of the Cardiff Chamber of Trade; A. J. Howell, Chairman of the Cardiff Technical Instruction Committee; Albert K. Foy, President of the South Wales Art Society; I. J. Chorley, F.I.O.B., President of the South Wales Federation of Building Trades Employers; Isaac Watkins, Secretary of the South Wales Federation of Building Trades Employers; James E. Turner, J.P., President of the Institute of Builders, South Wales Branch; J. A. Wilson, Chief Constable, Cardiff; J. C. Gould, M.P. (Cardiff Central); W. H. Jones, Director and Librarian, the Royal Institution of South Wales, Swansea; Douglas Duncan, Director, *South Wales News*; John Davies, President of the Cardiff Master Builders' Federation; William Thomas, Cardiff; E. P. Warren, F.S.A., F.R.I.B.A., President of the Berks, Bucks and Oxon Architectural Association; W. Glen Dobie, A.R.I.B.A., President of the Liverpool Architectural Society; Francis Jones, F.R.I.B.A., President of the Manchester Society of Architects; W. S. Skinner, F.R.I.B.A., President of the Bristol Society of Architects.

The toast of "The Royal Institute of British Architects, the Society of Architects and the Allied Societies" was given by the President.

In response, Mr. J. A. Gotch said it was a pleasure to do anything in a spirit of friendship to unite the Royal Institute with the Allied Societies. The greater the number of architects who distinguished themselves in the provinces, the greater was the need for one representative body to voice their views. The body most suitable for that purpose was the Royal Institute of British Architects, and this applied to other matters in addition to the important one of registration. Whatever might happen with regard to registration—and there was reason to suppose that was attainable—it was necessary to maintain the wide influence of the Institute. This was of paramount importance. The wider its sphere of influence the more efficient would it be in its task of representing architecture. There were innumerable matters outside this question with which the Institute dealt, and one of the most beneficial would be to weld the whole profession into one solid body. In this task the Council had a great opportunity, and they had approached the Society of Architects with a view to carrying out amalgamation. In that they had been singularly successful so far as the two Councils were concerned. Absorption had been practically arranged upon terms that were honourable to both societies. One indispensable condition insisted upon by the Society of Architects was that the question of registration should be pursued to its final issue. That the Royal Institute willingly undertook. The profession ought to speak with one voice, and not with two or more.

Education, competition and a high standard of professional conduct were other objects for which they strove, and in dealing with public authorities they should speak with one authoritative voice. There has been a considerable change in the Institute since it was founded some ninety years ago. Then they were chiefly concerned with London architects, but now they had to give attention to matters such as education and learning to meet the altered conditions in which they lived.

Mr. J. E. Partridge, alluding to the Commission of Fine Arts, said if it had been formed some years ago they would not have been encumbered with the awful entrances to some of their cities. He wished every city were blessed with the same far-seeing government that Cardiff appeared to have. The primary object of the formation of the Society of Architects was to secure registration. Everyone recognised that this was most desirable, not only for the practitioners, but those whom they served. It might be urged that they were trying to form a Trade Union, but they were trying to do nothing of the sort. Their objects were entirely different, and, indeed, in some respects they had suffered from the manner in which Trade Unionism had developed. They were out for the benefit of their craft. If the scheme of registration went through, they, as a society, would cease to exist, and though they felt some little sadness at the prospect, he felt it would be for the good of the profession.

Mr. J. C. Gould, M.P., replying to the toast of "Our Guests," referred to the question of housing. He said he trembled to think of the cost of the schemes which were being advanced. The present proposals of the Ministry of Health did not in the slightest degree take into consideration the question of economic rent. How much were the people of the country prepared to pay to subsidise those schemes if the proposed rent would not meet even the capital interest. He viewed the situation with great alarm. In 1921 they went forward with schemes in the belief that the trade boom would be continued—unfortunately he was one—but when things came down the most courageous thing they could do was to come down with them. He had never seen a time during the past three years such as they had had recently when things industrially had been so good, and yet during the past month that feeling of confidence had been sunk by the strikes that were taking place.

The thirty-fourth annual general meeting of the South Wales Institute of Architects was held at Cardiff recently. The president addressed the gathering on the work which had been accomplished during the past twelve months, particularly with reference to the possible amalgamation of the two leading architectural bodies in the country, the Royal Institute of British Architects and the Society of Architects. The honorary treasurer (Mr. Harry Teather, F.R.I.B.A.) presented the balance sheet, which showed the Institute to be in a very strong financial position.

On the proposition of Mr. C. F. Ward, F.R.I.B.A. (Newport), seconded by Mr. H. C. Portsmouth, F.S.Arc. (Swansea), Mr. Percy Thomas, O.B.E., F.R.I.B.A., was unanimously re-elected as president for a third term of office. The following officers were elected:—Vice-presidents, Messrs. C. F. Ward, F.R.I.B.A., and H. C. Portsmouth, F.S.Arc.; hon. treasurer, H. Teather, F.R.I.B.A.; hon. auditor, C. S. Thomas, F.S.Arc.; hon. librarian, C. H. Kempthorne, Lic.R.I.B.A., hon. secretary, Ivor P. Jones, A.R.I.B.A. Members of the Council (Central Branch): A. G. Edwards, M.S.A., J. P. D. Grant, A.R.I.B.A., W. S. Purchon, M.A., A.R.I.B.A., R. H. Winder, M.A., A.R.I.B.A., F. H. Heaven, A.R.I.B.A., T. Alwyn Lloyd, F.R.I.B.A., J. B. Wride, C. F. Jones, A.R.I.B.A. J. Williamson, A.R.I.B.A.; Associates' representative, L. S. Hatchard. Western Branch: J. Herbert Jones, F.S.Arc., G. R. H. Rogers, E. E. Morgan, A.R.I.B.A.; Associates' representative, G. L. Crocker. Eastern Branch: Horace Jones, F. Swash, F.R.I.B.A.; Associates' representatives, J. E. Lenton.

DEVON AND EXETER ARCHITECTURAL SOCIETY

The annual meeting of this Society, which embraces the counties of Devon and Cornwall and is in alliance with the Royal Institute of British Architects, was held at Plymouth recently. The members present were t President, Mr. Percy Morris (Exeter), in t chair, and Messrs. L. F. Tonar, W. J. M. Thoma son, J. Bennett, O. Ralling, and J. Challice, As Hon. Secretary (Exeter), J. L. Fouracre, A. Bewes, A. S. Parker, A. C. A. Norman, Priestley Shires, R. A. Mill, Victor Prigg, W. May, E. Coath Adams, F. A. Vercoe, S. Ackroyd, H. Watts, B. S. Baily, P. O. Wakeham, J. R. Millman, E. E. Brown, and F. Stilwell (Plymouth).

The minutes of the preceding meeting we read, adopted and signed by the President, a Mr. F. S. Stilwell was duly elected an Associa Member of the Society.

The annual report, which showed a conside able increase of membership—the numbers n being 109—and balance sheet were presente received, and unanimously adopted.

The President, Mr. Percy Morris, F.R.I.B. then delivered his address. In the course of remarks he said when the history of rece years was seen in its proper perspective it wou be noted, he thought, as a curious parado that, at a time when upwards of a million their population were unemployed, and the ne of houses never more urgent, the activities the building industry were curtailed by la of skilled operatives, whose numbers h shrunk nearly 50 per cent. since 1911, and t efforts of this remnant were frequently dissipat by intestine feuds. And the comparison wou be made that in the four years following t war, France had restored 598,000 houses and established the normal population of liberated areas; besides building 20,000 fa tories, and bringing back to cultivation 88 p cent. of her devastated regions. But in reviewi the past, they must also look forward to t future. They could not shut their eyes to t fact that there were post-war elements of t situation which were inimical to rapid recove and the establishment of lasting prosperi Among the most disconcerting features were t lamentable decay of craftsmanship and gene slovenliness of execution, which had become marked since the volume of work increas But another fact was clearly emerging, it w that low grading of wages did not necessar mean economical work, because in the pres state of the labour market a very high perc tage of inefficients drifted to the low-grad districts.

Then there was the high price of materi They knew instinctively that there was conti and cases had been brought to his notice; also of charges by merchants considerably excess of retail prices fixed by manufacture But when these cases were followed up one fou some flaw in the evidence which prevented th being exposed. It was those practices wh kept alive that widespread feeling of mistr and suspicion which was hindering progre and it was hypocrisy to blame labour for ev ill whilst those things pass unchallenged.

But if the future were to bring better c ditions, it could only be by determined ef to organise upon lines better fitted to n modern needs, and by a return to sound cra manship under capable direction. Rec struction must be on lines differing in m respects from those suited to towns and t must be more elastic; there could never that rigid line between different trades wl inter-trades union jealousy fostered, and s simple but reasoned system of estimating pr must replace the present guesswork. Met in setting out and handling work must be brought to bear in eliminating the wast process of trial and error one so freque met with. Co-operative effort, in the direc of depots for the supply of materials and t transport, would save intermediate profits was worthy of consideration.

There remained two fundamental probl The first was the man and his equipment his work; the second, the means by whic was to be retained in country districts. far as the man was concerned, there coul little doubt that the right type was one and reared in the country; and the equipm he needed was education. By educatio this sense, he meant, first, a sound ground

build upon and the knowledge of how to arn, so that education could be continued in ter life if there were ambition. And—equally nportant—the formation and moulding of haracter, and the art of rational amusement in mes of leisure. Second, a return to apprenceship under proper safeguards, and, the comement of this, a course of technical training. echnical schools were invaluable but they ad their limitations, and, alone, would never rn out a completely equipped craftsman for ie work they were considering. There was ope for the right type of man to rise comratively early in life, after passing through ie ranks of apprentice and journeyman, to the osition of a master craftsman; whereas most his confreres in the towns would remain urneymen all their days.

But architecture, too, had entered upon a hase which was pregnant with possibilities. hey recognised that new forces were stirring, nd if in their Western remoteness the scinllations of new planets revolving in the rchitectural system, sometimes in conjunction nd frequently in opposition, were a little azzling to the eyes of those whose orbit lay utside the path of brilliant constellations, et they detected beneath this friendly rivalry ie same enthusiasm as they remembered in ygone days; but it was only when they ompared the opportunities of present-day tudents with those of their own time, that hey realised the width of the gulf which was eing bridged.

Let them look forward to the time when a niversity of the South-West would have its chool of Architecture; and, beyond that, to he day when each school would have its ostgraduate course to keep alive their enthuasm and their knowledge abreast of progress.

At the conclusion a vote of thanks was xpressed to the President for the address, to hich the President responded.

NORTHERN ARCHITECTURAL ASSOCIATION.

An increased membership was recorded at the nual meeting of the Northern Architectural ssociation, held recently at Newcastle, under e chairmanship of Mr. W. T. Jones. The ouncil's report stated that the total membership as 291, as compared with 269 for the previous ssion. Officials for the ensuing session were ected as follows: President, Mr. W. T. Jones; ice-President, Mr. G. Reavell, O.B.E.; Hon. reasurer, Mr. J. T. Cackett; Hon. Librarian, r. F. N. Weightman, M.A.; Hon. Secretary, r. G. H. Gray; Assist. Hon. Secretary, Mr. F. H. Checkley. Members of Council: Messrs. W. Boyd, J. W. Hays, W. Milburn, junr., K. Tasker, and L. W. Taylor. Associate embers of Council: Messrs. G. Talbot Brown, A. Child, R. N. MacKellar.

NCORPORATED SCOTTISH ARCHITECTS

The monthly meeting of the Council of the corporation of Architects in Scotland was d at Edinburgh recently, Mr. T. P. Marwick, .I.B.A., president, in the chair. During the rse of the meeting reference was made by chairman to the recent death of one of the ncil members, Mr. John Watson, F.R.I.B.A. dinburgh), and it was resolved to send tter of condolence to his widow and family. students were elected. A presentation was de by Mr. J. B. Brechin, 131, George-street, inburgh, of 14 large coloured drawings, 13 ng of architectural work carried out by the Mr. David Bryce, R.S.A., and one of the ab of Sir John Crosby, St. Helen's Church, hopsgate, by the late R. W. Billings, architect.

Change of Address.

The British Reinforced Concrete Engineering , Ltd., are removing on April 12 to King's ldings, Smith-square, Westminster, S.W.1.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

*** *We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in type-script?—Ed.

[Reply to "Hospital."]

The cost of hospital building varies so considerably according to the character of building to be erected, number of patients accommodated, and whether teaching facilities are to be included, that each building must be taken on its merits. For prices ruling before the war there is a list given in a paper in the R.I.B.A. *Journal*, December 23, 1911, on German hospitals. English General Hospitals varied from £300 to £600 per bed. The writer built one hospital in 1914 costing £330 per bed, and another of two pavilions only to existing hospital £150 per bed. The prices at present ruling are about £500 to £1,000 per bed.

"Unit."

Libraries and Inhabited House Duty.

Sir,—We are designing plan for a library building, in which it is desired to have a resident caretaker directly connected to the main library building. If this were done, would the whole building be liable for inhabited house duty? On the other hand, if the caretaker is entirely cut off from the library and has a separate access to the outside, would his house alone be liable for duty and the remainder of the building exempt? "Designer."

Portraits of Inigo Jones.

Sir,—With reference to your list of the portraits of Inigo Jones, published in your issue for March 14, may I supplement this by another example, viz., that in the collection of Lord Mildmay at Berkley-square, but who the artist is, I believe is not known for certain, though it would appear to belong also to the school of Van Dyck.

E. R. Hudson.

London, S.W.1.

Asphalting Zinc Roofs.

[Reply to Inquiry, March 14.]

Sir,—If the zinc has become porous it is probably due to the action of acids contained in the air, soot, &c., of town, as it is not a particularly long-lived material under the conditions obtaining.

I would suggest a thick coat of Portland cement wash, on top of which a good roofing felt should be laid in accordance with the firm's instructions. This will give a good waterproof roof, easily repairable at little cost that will last for years.

W. G. Watkins.

Plymouth.

Planning for Subsidy.

Sir.—The rules governing the eligibility of houses for the subsidy vary in different districts, but generally include a clause that excludes verandahs and porches outside the containing walls of the house from the prescribed floor area. Would you consider that a porch built over on the first floor must be therefore included in such floor area, even if entirely open on the ground floor? or can the "containing wall of the house" be considered to be the inside walls of the open porch in this case?

"Subsidy."

Measurement of Brickwork.

[Reply to "Puzzled."]

Sir,—Building practice takes its lead from the nearest big city—in the case of the Home Counties, from London. Here most building is on a big scale with walls for the most part 18 in., 14 in., and 9 in.—an average of 1½ bricks thick. Recent years experience lead us to forget that brickwork was once cheap, making a higher unit of measurement than the yard more convenient when dealing in round figures, and the square rod, pole or perch comes next above the square yard as a unit of measurement. The yard would certainly somewhat simplify squarings and be very convenient in these days of high prices, and the thickness of one brick be perhaps more handy in an age of activity in small domestic work; but custom is hard to eradicate and different districts will no doubt continue in the methods to which they are used.

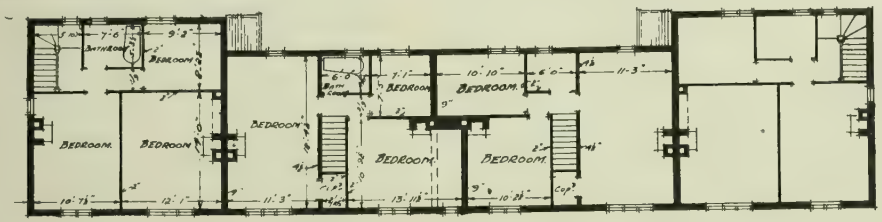
"Perhaps."

Removing Paint from Brickwork.

[Reply to H. Taylor.]

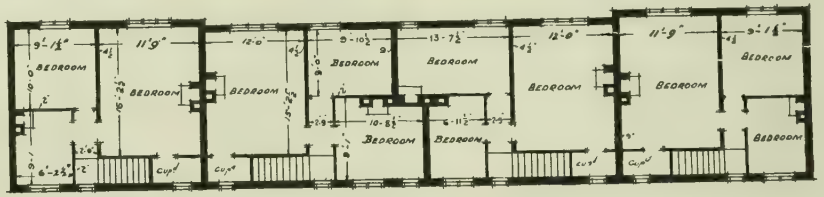
We should advise the use of the blow-lamp to burn off the paint. This can be applied more thoroughly than in the case of woodwork as there is no fear of damaging the under surface. The brickwork should then be thoroughly brushed with a stiff wire brush and the joints raked out as a key for the cement.

EARLY CHRISTIAN EUROPE.



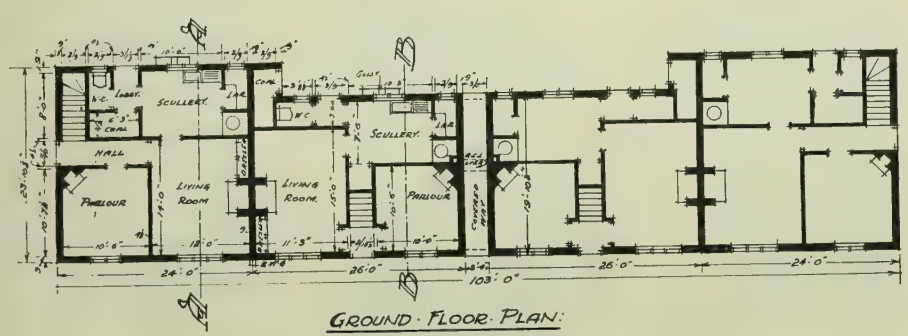
Sir Banister Fletcher, in a recent lecture at the Central School of Arts and Crafts, dealt with early Christian Churches in Ravenna, Torcello, Sicily, Egypt, Syria, and the Near East. After the Peace of the Church he said the Early Christian building epoch through the Roman Empire began in the fourth century. The building activity of the world passed from the hands of empire-builders into the hands of church-builders. In all the provinces of the Roman Empire, just as there were built forums, camps, and amphitheatres, so there were found the remains of these basilican churches in England, in Egypt, and in Syria. In plan and construction these churches were Roman, in detail and decoration they were largely Byzantine, but in purpose and spirit they were entirely and essentially Christian.

The position held by the city of Ravenna, both historically and geographically, made her an important factor in early Christian architecture. There were beginnings of things that became important elements in mediæval church architecture. S. Apollinare Nuovo had a circular tower. It was an instance of an old form adapted to a new purpose, and thus the Early Christians evolved the belfry tower from the fortified watch-tower with its look-out. There, too, was the dosseret block above the capital, which was ultimately to change the concave Classical capital into the rounded Byzantine capital.



THE WESSEX SOCIETY OF ARCHITECTS.

The first annual general meeting of the Wessex Society of Architects was held at Bristol. This Society has come into existence as a result of the federation of the Bristol Society of Architects (founded in 1850) with its younger sister, the Gloucestershire Architectural Association, and is allied to the Royal Institute of British Architects.



Officers were unanimously elected for 1924–1925 as follows:—President, Mr. G. C. Lawrence, A.R.I.B.A., R.W.A., Bristol; Vice-Presidents, Mr. G. P. Milnes, Stroud (President of the Gloucestershire Architectural Association), Mr. W. S. Skinner, F.R.I.B.A., Bristol (President of the Bristol Society of Architects); Hon. Secretary, Mr. H. Stratton Davis, M.S.A., Gloucester; Hon. Treasurer, Mr. T. A. Skinner, A.R.I.B.A.

THE TOWN-PLANNING EXHIBITION AT UNIVERSITY COLLEGE

By W. R. DAVIDGE.

Professor Adshead, with his usual thoroughness, has brought together a very fine collection of studies in town planning, carried out largely by present and past students of the Town-Planning Department of University College, under Professor Adshead's own direction.

The larger portion of the work executed is naturally within fairly easy reach of London, and the civic survey work and the actual lay-out plans indicate an exceedingly high level of attainment, in most cases the result of several years of patient and continuous work. Professor Adshead's success with his students is due very largely to the fine measure of enthusiasm which he himself instils; and the pioneer work done by the Town Planning Department of the School of Architecture, London University, is already having, and is certain to have in the future, a very marked effect upon the development of Greater London and of many of our provincial towns throughout the country.

The outstanding features of the Exhibition are the two models made by the students, one showing the Duchy of Cornwall Estate at Kennington, now under reconstruction by Messrs. Adshead & Ramsey, on behalf of the Duchy, and the other showing the interesting London County Council re-housing scheme on the Tabard-street area, which has been carried out under Mr. Topham Forrest, the Architect to the L.C.C..

It will be remembered that the latter consists of five-story blocks grouped round a central open space, and the Kennington scheme of two or three stories only.

Both schemes are excellent in their way in showing what can be done by re-housing on existing areas, however congested, whether in tall blocks or in cottages; and both, although entirely different in character, are interesting object lessons of the way in which the whole of the dilapidated slum areas of London might be, and should be, reconstructed.

The acres and acres of old worn-out residential property which exist all over London, especially around the fringes of the commercial and industrial districts, call for drastic treatment on a big scale, and, although it is not feasible to undertake more than a few of these areas at a time, it is more than ever essential that all such reconstruction work should be carried out as part of a general plan. It must not be overlooked, however, that in both the estates in question there is a benevolent ownership—in the one case the Prince of Wales, in his capacity as Duke of Cornwall, and in the other the greatest municipality in the world, in the shape of the London County Council.

What is wanted is an extension of these magnificently drastic methods to other areas of London, equally squalid and equally in need of attention. The main difficulty is in the multiplicity of small owners, and the fact that even the most drastic of Housing Acts must have respect to the individual rights of the small owner. Confiscation is not possible or desirable; what is wanted is either a system of pooling of interests for the purposes of a common improvement or, preferably, a general plan of reconstruction laid down by a competent authority, to which all owners must conform in due course. With a forty years' programme of consistent progress and improvement, even such sordid and blighted boroughs as Shoreditch and Bermondsey would begin to see daylight, and the hopeless would begin to take hope in the future of our great cities.

A careful study of the civic survey zoning plans of the London Society shows, borough by borough, how the steady pressure of industry and commerce, in its outward expansion, is as steadily worsening the already congested conditions in the adjoining residential areas. These diagrams, too, are useful in showing how diversified are the areas brought into use for business and residence—in many the areas best suited for commerce or factories are already allocated to residential use, and it can only be a matter of a few years before such areas are entirely absorbed for business purposes.

Professor Adshead and his students are to be particularly congratulated on the attractive and graphic way in which the various town-planning proposals are presented. The students have visited and studied on the spot most of the problems which to-day vex the inhabitants of London and Greater London, and they have been particularly fortunate in the happy selection of colours in which the result of their work is recorded.

Probably no town-planning exhibition so far has been so uniformly well presented as the one now to be seen at University College. The Exhibition is not a large one, but is of uniform and high excellence in pictorial presentation, and is in every way a model of what such an exhibition should be, if it is to appeal to the general public through the medium of the eye.

Amidst so much really excellent material it is a little difficult to mention names, but there are several drawings of such outstanding merit that they deserve particular mention. Chief among these may be mentioned the fine work of Mr. W. Harding Thompson, A.R.I.B.A. His drawing of The Great West Road, or Brentford By-pass as we still prefer to call it, is finely shown, and is given a place of honour at the entrance to the Exhibition. His lay-out for the Ramsgate Scheme is also an excellent piece of work, both in planning and in draughtsmanship.

The skilful handling of colours, which is so marked a feature of the work of Prof. Adshead and his students, is shown to particular advantage everywhere in this Exhibition, and the blue waters of the Adriatic are brought to the service of the Thames or the Hamoaze in a most delightful and inspiriting way.

The work of Mr. Blake in constructing the Tabard-street model, with the aid of assistance from the L.C.C. architectural staff, also deserves special mention. As a model it is particularly successful, and when one understands that the whole idea was conceived and carried out in a week or so, it is especially noteworthy as a brilliant piece of work.

Mr. Dixon's model showing the junction of the Great West Road and the Chiswick High Road as it should have been constructed is also interesting as a reminder of the many opportunities which are daily being missed in the development of our arterial roads. It is to be hoped, however, that these valuable suggestions will, many of them, be adopted before the opportunity finally passes. On all our main roads there are many such points where the architectural possibilities are at least as important as the soundness of the road construction itself, and once the matter is so forcibly brought before them, the Ministry of Transport are not likely to overlook so obvious and convincing an argument for architectural assistance in all that they do.

The Civic Survey of Barnet is well shown on a number of well produced drawings, the work of Mr. Fincham and Mr. Heck being particularly good.

Mr. A. G. Waller has also done some very good research work in connection with town planning, and his drawings at the Exhibition show that, although in another field, he has inherited some of the ability of his talented father, the late Professor Waller.

Mr. R. A. Hudson shows a study of the Lydden Valley—a small section of the Kent Coalfield—an area which is undoubtedly destined in the near future to become one of the most important industrial areas of Great Britain.

The work of Mr. B. F. Brueton, an old student of the School of Town Planning, is also noteworthy, and his examples of practical town planning carried out at Bristol under Mr. L. S. McKenzie, the City Engineer, are of interest.

Mr. L. C. Foulkes' work in connection with war memorials at Llandudno and elsewhere also deserve special mention. In the problem of development of our seaside towns there is an ample scope for the present generation of town planners, and it is gratifying to note that the municipal authorities of most of our seaside towns are fully alive to the solid commercial value of good town planning.

Apart from town planning proper, however, there is much of interest to note in the purely architectural side of the Exhibition. Public garages and open-air swimming baths, pergolas and pavilions, offer magnificent scope for the architect, and it is all to the good that there should be the closest of touch between the town planner and the architect or architects responsible for the principal objects of town furnishing.

In congratulating Professor Adshead and his students on this most successful of exhibitions it may perhaps be opportune to remember that the R.I.B.A. itself has recently introduced a special diploma examination in town planning specially adapted to members of the Institute, and such exhibitions as the present, together with the valuable series of conferences with which it is accompanied, serve to emphasise yet once again the essential connection between architecture and town planning. The University of London, together with its sister University at Liverpool, is doing a great work in training the architect of the future in the all-essential principles of town planning and town extension. Neither the municipal engineer nor the architect can afford to ignore the art of town planning, which is here so excellently presented, and there deserves to be a great influx of students in the near future.

With the introduction of compulsory town planning for all towns of more than 20,000 inhabitants, the field for statutory town planning is a wide one, but it is as nothing compared with the need that exists in every community, large or small, throughout the world, for men of capacity and imagination to look ahead and prepare a considered programme of essential work in advance of actual need, so that when the opportunity occurs the plans are ready.

THE OPENING CEREMONY.

In declaring the Exhibition and Conference open, on Monday last, Prince Arthur of Connaught referred to his previous connection with the University College, when he opened the Bartlett School of Architecture. The movement in favour of town planning, he continued, began in the latter part of the nineteenth century as a revolt against the unsightly and ugly buildings springing up everywhere according to the passing whim of the time, or the enterprising but not very artistic conception of the "speculative builder." The Public Health Act of 1875 had no doubt made our towns probably the healthiest in the world, but the standardisation which the universal by-laws created produced an ugliness and monotony little short of appalling. The Town Planning Act of 1909 gave local authorities power to prepare plans the success of which depended on the imagination and foresight of officials, and therefore it was most necessary that they should be highly educated in order to secure the greatest efficiency in administration. Town planning was one of the newest subjects taught at universities, and it was obvious that the education of officials in town planning ranked in importance with that of municipal engineers. Since the war it had been a source of great pride and gratification that Great Britain had led the way in carrying out big housing schemes on town-planning lines, and in spite of all the difficulties which had since arisen in the matter of building these housing schemes would always remain an example to posterity of what town planning really meant. The advantage of town planning became increasingly evident year by year and almost day by day. He would like to tender his congratulations to the official of the Ministry of Health, who had not only set

h standard of administration, but had taken triking lead in the matter of public education. would also draw attention to the services dered to the town-planning movement by fessor Adshead.

Professor S. D. Adshead, in a statement on work of the Department of Town Planning the University of London, said they held that vn planners were about as far ahead of engi- rs as statesmen were of politicians. There s hardly a local authority in and around ndon whose area the students had not visited l decided how things ought to be improved. there were a "fire of London" to-morrow all plans were ready for the rebuilding. He ught they should seek combination of effort, architects, engineers, and surveyors were all essary in the preparation of a widely-con- ered scheme. He hoped in the future to ate the Department more closely to the partments of Engineering and Hygiene. In w of the increasing importance which was ng attached by local authorities to town- nning, it should be an important subject in curriculum of any student who intended to ome a municipal engineer.

Sir John Bradford occupied the chair at the emony, and amongst those present were Sir egory Foster, Sir George Blacker (Dean of the dical School), Mr. E. de Q. Quincey (Treasurer the College), Mr. Andrew T. Taylor (Chairman the Managing Sub-Committee), the Mayor of Pancras, Professor A. E. Richardson, Sir ank Baines, Mr. G. Topham Forrest, Mr. J. alker Smith, Mr. Raymond Unwin, Mr. Paul aterhouse, and Sir William J. Collins.

Zoning.

The first of the series of conferences on town nning subjects, which are being held during week, was opened by Mr. Raymond Unwin, R.I.B.A., on Tuesday. The subject under cussion was "Zoning Requirements of Town- nning Schemes under the Act." The chair s occupied by Mr. J. A. Gotch, President of Royal Institute of British Architects.

In opening the discussion, Mr. Unwin said oning" was a term for indicating the areas land in and about our centres of population ich were to be allocated for certain purposes, restricted in certain ways, or to be limited buildings adapted to certain specific purposes, a limited range of uses, heights and character. e necessity of zoning was urged for the general son that it had been borne in upon them ng to the catastrophic destruction of the enities of towns which took place during the wth of the industrial age during the last tury mainly, but not exclusively. At that e people concentrated their attention on the velopment of industry, and not sufficient ught was given to the effect of that growth the character of the towns and the character the dwellings of the people. It was now lised that in regard to the use of land, rticularly land in districts where human settle- nts might take place, it was of vital impor- ce that each part of the limited area of d should be put to the use for which it was t adapted, and which would most conduce he benefit of the community. If care were taken that land was used in the best and st economical way in the public interest they ht largely destroy the possibilities for an nomical, efficient, comfortable, and beautiful upon such land. It was recognised that the rests of owners of land, as a body, and the lic seldom differed; the interests of in- dual owners might be considerably different the interests of the community, but the rests of landowners, as a whole, very nearly cided with the interests of the community the economic point of view. Anything h ministered to the economic prosperity of community would enhance the value of land he whole of the owners as a class. The e of land depended primarily on the total of the advantages to be derived from g on a certain piece of land instead of ewhere else, and anything which improved total sum of the advantages of a piece of helped both the community and the land- owners. There was no conflict of interest between the landowners as a body, although there might be conflict of interest between the public and any one individual landowner. Zoning was, therefore, based on the consideration that individual owners of plots of land were not in a position to judge what was best in the public interest, and frequently had no immediate interest in zoning. That was where the individual owners of property differed in their point of view from the point of view of the whole of the owners if looked at collectively. The main purpose of zoning regulations in regard to built-up areas and towns, which were at present only included to a limited degree, but for which it was expected further powers would be granted before long, was to secure the regulation of the distribution of different classes of buildings so far as was consistent with the general interests of the town, and gradually to eliminate harmful or incongruous buildings. It was also necessary to improve the existing arrangements by making suitable provision for buildings of different classes which, though not unsuitable, were more or less of a different character from the remainder of the buildings in a town, and to conserve areas over which expansion should be prevented from taking place. At the present time towns grew haphazard, with the result that usually no particular part of a town could grow unless at the expense of another part. That entailed a huge economic waste, because the commercial heart of a town was growing at the expense of another part; it was only possible to get a business area increased by pulling down buildings which were built in a place which ought to have been reserved for the expansion of commercial building. Town planners sought to lay out land so that each part would have scope for expansion. In connection with unbuilt-on areas they thought more of the future, and to secure the orderly development of a town by providing that each area of land might be used, and in some cases reserved, for the exclusive use of the particular range of purposes for which it was best suited, and which was most likely to contribute to the amenity and prosperity of the town. Looking to the future in this way would save the community a great deal of expense in pulling down one class of property to make room for another, and protect owners of property from injury which might arise through owners of neighbouring land putting up incongruous buildings which would reduce the value of existing buildings. Greater attention would also be given to the character of buildings in different areas, and appropriate form and outline, for a growing town as a whole. Sufficient unbuilt-on areas would be preserved for the various growing needs of the community, so that they could expand without clashing with buildings devoted to other purposes. Zoning called for the exercise of imagination and foresight of a high order. The man or community preparing zoning regulations needed to get away from detail, and try to see the problem as a whole. The expanding size of town-planning schemes and their gradual approach to the regional scheme had brought in its train a rather serious dilemma. It was evident that town-planning schemes must protect a very wide area, many times greater than was likely to be developed within a period to which they could look forward with any reasonable knowledge of what was going to happen. The difficulty was that although they must include all that area, they did not, and could not, know which particular part would be the subject of development. It was, therefore, necessary to prepare plans and zoning regulations for whole areas.

On Wednesday Mr. G. I. Pepler opened a discussion on "Technical Requirements in the Preparation of Schemes," and on Thursday Dr. I. G. Gibbon, C.B.E., opened a discussion on "Town-Planning Schemes in their Relation to Regional Development." This evening Mr. G. Topham Forrest, Architect to the London County Council, is to deliver an address on "Architectural Interests involved in the Making of Town-Planning Schemes."

TOWN PLANNING AT WEMBLEY

The Right Hon. J. Wheatley, M.P., Minister of Health, will visit the Town-Planning Exhibition which will be held at the British Empire Exhibition, from April 23 until May 17. The Town Planning Institute is organising a Conference in connection with the Exhibition, and the following programme has been arranged:-

May 5.—11.30 a.m.—Visit to Town-Planning Exhibition by the Right Hon. J. Wheatley, M.P. (Minister of Health). 2.30 p.m.—Subject: "Town Planning in the Dominions and India." Chairman, the Right Hon. Sir Joseph Cook, P.C., G.C.M.G. (High Commissioner for Australia). Papers: "Town Planning in Canada," by Thomas Adams, F.S.I., Past President, lately Town-Planning Adviser to the Commission of Conservation, Canada; "Town Planning in India," by H. V. Lanchester, F.R.I.B.A., Past President; "Town Planning in Australia and New Zealand," by W. R. Davidge, F.R.I.B.A.

May 6.—10.30 a.m.—Subject: "Regional Planning." Chairman, Alderman Thomas Turnbull, D.L., Chairman of the Manchester and District Joint Town-Planning Advisory Committee. Papers: "Planning Industrial Regions," by Professor P. Abercrombie, M.A., A.R.I.B.A., Vice-President; "Regional Planning," by G. L. Pepler, F.S.I., Past President. 2.30 p.m.—Subject: "Town-Planning Schemes." Chairman, The Right Hon. the Lord Mayor of Birmingham, Alderman T. O. Williams, J.P. Papers: "Town-Planning Schemes for Large Cities," by F. H. C. Wiltshire, Town Clerk of Birmingham; "Town-Planning Schemes for Small Towns," by C. J. F. Atkinson, LL.B., Clerk to the Otley Urban District Council.

May 7.—10.30 a.m.—Subject: "City Development." Chairman, Sir Aston Webb, K.C.V.O., Hon. Vice-President. Papers: "Distribution," by Raymond Unwin, F.R.I.B.A., Past President; "City Design," by Professor S. D. Adshead, M.A., F.R.I.B.A., Past President. 2.30 p.m.—Subject: "Roads." Chairman, Sir Henry Maybury, K.C.M.G. Papers: "Planning Main Roads," by J. A. Brodie, Past President Inst.C.E., Hon. Vice-President.; "Planning Estate Roads," by T. Alwyn Lloyd, F.R.I.B.A. 7 for 7.30 p.m.—The Tenth Anniversary Dinner of the Institute will be held at the Savoy Hotel, W.C.2, when the Right Hon. Neville Chamberlain, M.P. (Hon. Vice-President), will be the chief guest. Price of tickets, 15s. each (exclusive of wines). Application should be made to the Secretary for tickets, enclosing remittance, as early as possible.

May 8.—The Conference will be continued by the Garden Cities and Town-Planning Association. 10.30 a.m.—Conference on: The Industrial Penetration of Rural Districts; Local Government Problems. 2.30 p.m.—Conference on: Finance and Machinery of Establishing Garden Cities.

May 9.—The Conference will be continued by the National Housing and Town-Planning Council. Members of the Institute proposing to attend the Conference are requested to inform the Secretary as early as possible in order that they may be provided with papers to be read, and Delegates' Tickets. No Conference fee is payable by members. Entrance to the Conference Room will be free, but the ordinary charge of 1s. 6d. will be payable for the main Exhibition, which will also admit to the Conference Room.

Tenders.

In our last issue we omitted the tender, at £61,166, submitted by Messrs. Patman & Fotheringham, for extensions to the Islington B.C. Offices. The accepted tender was that of Mr. George Bollom, at £60,777.

The tender of Mr. F. A. Roberts for the erection of almshouses at Ripley should have been given as £2,610.

THE BUILDING TRADES EXHIBITION

The forthcoming Building Trades Exhibition, which is to be opened at Olympia on Friday next, April 11, by the Rt. Hon. John Wheatley, M.P., Minister of Health, is the first Building Trades Exhibition to be held at Olympia since the enlargement of the ground floor area, and it promises to be a specially interesting and comprehensive show. The chair will be taken at twelve noon by Mr. J. A. Gotch, President of the Royal Institute of British Architects, who will be supported by many well-known architects and builders. For the ready use of visitors to the exhibition we give in this issue a loose plan of the main hall and the new hall, and on the reverse side a list of exhibitors and their stand numbers, and in the following pages a preliminary account of some of the exhibits. In our next issue we shall give further notices of exhibits, as well as other matter of special and general interest.

Anderson, D., & Son, Ltd. (Park-road Works, Stretford). **Stand 118, Row F.**

Patent Roofings.—The exhibit will comprise all classes of "Red Hand" roofing, sarking and lining felts and damp courses, also "Rok," "Stoniflex" and "Hippo" roofings. The special exhibits consist of a section showing the construction of a "Belfast" roof, and a section demonstrating Anderson's flat roofing system. Both these form the actual roof of the stand, and access to them is gained by a stairway. "Rok" roofing and "Ferro-Rok" are used as roof coverings on the Belfast roof. Wood fencing treated with "Sidol" wood preservative is shown, the stairway to the "Belfast" roof and the flat roof is likewise treated, as also is all other woodwork of the stand.

Associated Crafts, Ltd. (28, Avenue Chambers, Southampton-row, London, W.C.1). **Stand No. 274, Row P.**

Panelling.—"Dekart" is a material which is prepared to bear a close resemblance to any kind of oak or other hard wood, old or new. The likeness is not confined to the surface only, for if chipped exactly the same colour would be exposed as would be in the wood supplanted. "Dekart" panelling is made up in large pieces in the same way as natural wood panelling. It is claimed that it is damp-proof and fire-resisting, can be sawn, will take screws or nails without splintering, and will neither crack, warp nor shrink. On this stand many of the uses of the material will be demonstrated.

Australia Concrete Machinery & Engineering Co., Ltd. (Pordon-road, Brixton, S.W.2). **Stand No. 125, Row F.**

Concrete Machinery.—The principal exhibits on this stand will be the "Australia" concrete block and slab-making machine and the "Tonkin" mixer. The former is a simple type of hand block-making machine. The blocks are tamped by slamming down a hinged cover, and removed by raising the pallet by means of a foot pedal. It is claimed that 400 slabs per day can be made on this machine. The "Tonkin" mixer is of the open-drum type, in which the materials are in view during the whole time of mixing. The capacity of the machine is 3 cu. ft. per batch, and the output 40 cu. yds. per 8-hour day. The drive may be by a petrol engine mounted on the truck or belt.

Bell's Poilite & Everite Co., Ltd. (59½, Southwark-street, London, S.E.). **Stand No. 279, Row P.**

Asbestos Cement Products.—A feature of this stand will be an aerial tower, 60 ft. high, octagonal at the base, the roof of the octagon demonstrating the application of "Poilite" russet-brown pantiles and other forms of "Poilite" tiling. The portion above the octagon will be cladded externally with the new corrugated "Everite" sheeting known as "Everite Big Six." The portion above this will be cladded externally with standard "Everite" corrugated sheeting. The roofing between the two square portions of the tower will show the application of "Poilite" straight-cover slating in various colours, and the top of the tower will be covered with a hipped roof consisting of "Poilite" red standard diagonal tiling. The space under the octagonal roof will be open, the superstructure being supported on piers.

Blay, George (New Malden). **Stand No. 320, Row S.**

Steel Shelters, &c.—This firm will exhibit buildings made of 12 and 14 gauge corrugated steel sheets, self-supporting in that no structural work or bracing of any kind is necessary. They may be easily and quickly erected and complete buildings are supplied in all lengths, widths, and heights. Steel casements and centrifugal, portable electric, and diaphragm, suction and delivery pumps, with an output from 2,000 to 600,000 gallons per hour, will also be shown.

The British Vacuum Co., Ltd. (Parsons Green Lane, London, S.W. 6). **Stand No. 182, Row J.**

Vacuum Cleaners.—The British Vacuum Cleaner & Engineering Co. will show their heavy duty portable and stationary vacuum cleaning plants. This company claims that their positive type vacuum cleaning plant is undoubtedly the most satisfactory for the majority of vacuum cleaning problems. They also supply a turbine or multi-stage fan type of plant for the class of dust removal that requires this type of plant, such as factory work, where there are very rough floors and there is a considerable quantity of small refuse present. They will also exhibit their pneumatic suction plant for dealing with the removal of boiler flue dust.

Bruster, O. (4, Lloyd's-avenue E.C.3). **Stand, No. 220, Row L.**

Water Heaters.—The "Baseco," for use where unlimited supplies of hot water are required; the "Glow-Worm," in two sizes; and a working exhibit will be prominent features of this stand; also for the first time a new boiler, called the "Baby Glow-Worm," which has been introduced to meet the needs of the smaller houses. The "Baseco" boiler is designed so that the maximum efficiency is obtained with a minimum consumption of fuel. The No. 1 "Glow-Worm" will raise 42 gallons of water 100 deg. F. per hour, and the No. 2 size will raise 56 gallons of water 100 deg. F. in the same time.

"The Builder, Limited," will have two stands, namely, No. 126, Row F, where there will be reception rooms; a display of books of interest to the architectural, building and allied professions; models of "Old London Bridge," "Old St. Paul's," "Mill Lock" (the recently discovered second arch of Old London Bridge), "Old Westminster," and models of houses with three and four bedrooms made from the winning designs in *The Builder* Cost of Building Competition; news, lectures and music by wireless; and architectural illustrations displayed by means of a new type of electric optical lantern. The other stand, No. 245a, Row N, will be for the sale of *The Builder* only.

Burlington Slate Quarries (Kirkby-in-Furness, North Lancashire). **Stand No. 248, Row N.**

Slate.—This stand will take the form of a pavilion constructed of slate and stone from the Burlington Slate Quarries, demonstrating the application of these materials in various ways for different purposes. It will be floored with slate flags, some rectangular and others of random sizes and irregular contours. The main piers will be of slate stone in varying thicknesses, having weathered bed-joints in accordance with local custom, and the enclosing walls will be constructed in a similar manner. The roof and the upper parts of the enclosing walls will be covered with slates to illustrate some of the numerous sizes, qualities, and colours produced. The slates are known as "North Lancashire" or "Westmorland Dark Blue," and it is claimed that they constitute the most durable and, wherever a permanent structure is required, the most economical roofing material in the country, that their appearance is unexcelled, and that their texture brings within reach advantages in effect which are otherwise unobtainable.

Byrd, A. A., & Co. (11, Queen Victoria street, London, E.C.4). **Stand No. 238, Row N.**

Metaforms.—This firm will be showing the "Metaform" interlocking steel forms for moulding any shape or form in concrete in situ. A single course 2 ft. high, composed mainly of standard forms 24 in. by 24 in., with an assortment of fractional widths of plates, inside and outside, right-angle corner units and hinged corner units will be set up around the entire stand, forming a wall 2 ft. high, with various projections and recesses. At one or more points a portion of the second course will be erected on top of the first 2 ft. course to illustrate how this and the succeeding courses are dealt with. There will also be samples of the various other standard and special types of "Metaforms" for various classes of concrete construction. A sample section of finished wall will also be exhibited to show the smooth face of the wall as left by the plates when removed. Various other appliances for bending and cutting steel reinforcement bars, &c., will also be shown. A range of the "Wallace" electric bench wood-working machines will also be shown on this stand, and demonstrations will be given with them. All these machines are complete portable units, having ¼ or ½ h.p. electric motors mounted direct on the machine.

Carron Company (Carron, Stirlingshire). **Stand No. 164, Row H.**

Firegrates.—This exhibit will comprise range firegrates, baths, electric and gas cooking and heating appliances. "The Carron" range (fitted with an inner glass oven door) embodies modern improvements, including cast iron flues, hot closet with glass doors, &c. The well-known portable range, the "Beetonette" has its usefulness increased with a high-pressure back boiler. "No. 429" and "Cambrian" ranges will also be on view. A feature will be the "Carronia" combination firegrate (Preston patent). This grate, built on new lines, is, the claim, a revolution in its type. It is slow combustion in action, and has no complicated, troublesome regulating devices. A special feature of the "Carronia" is that all heat is utilised and simply regulated by adjusting the canopy. The oven being heated by hot air, the temperature is quickly raised and easily maintained. The "Carronia" gives a copious supply of hot water and is economical in fuel.

Churchill, Charles, & Co., Ltd. (9–15, Leonard street, Finsbury, E.C.2). **Stand No. 2, Row Q.**

Floor Surfacing.—This stand will be chiefly devoted to the well-known floor surfacing products of the firm. Alundum safety products, showing a range of floor and stair nosing tiles in various colours, plain, and with countersunk screw holes, will be on view, and other exhibits will include mosaic tiles, ¾ in., 1 1/16 in. square and 1 in. hexagon, in various colours; aggregates for treating cement floors and terrazzo to render them slip-proof, in two sizes and various colours; pre-cast terrazzo tiles; reinforced mats suitable for tramcars, omnibuses, trains, &c.; samples of pre-cast stair treads and slabs, some treated with aggregates and others with tiles; aggregates combined; samples of rubbing bricks of various shapes and sizes for rubbing down terrazzo. On this stand will also be shown "Manning" abrasive cloths and papers, waterproof speed-grits for the wet rubbing down of enamels, varnishes, &c.; waterproof flint pa-

or the wet rubbing down of paint; garnet paper or sanding woodwork, and metalite cloth and paper for polishing metal.

Cayless Bros., Battersea (Battersea Park-road, S.W. 8). **Stand No. 177, Row J.**

Ladders.—This firm will show a varied exhibit of ladders, barrows, trestles, hand-trucks and building plant; also a special show of their patent "C.B.B." telescopic ladders in two and three sections, complete with many patented improvements. Emphasis will be placed on the fact that, being actual manufacturers, goods can be supplied direct to the user at first prices.

Elliott, Samuel, & Sons (Reading), Ltd. (Caversham, Reading). **Stand No. 190, Row J.**

Woodwork.—Messrs. Samuel Elliott & Sons (Reading), Ltd., will have some rather unusual features. On approaching through the entrance one will see a classic portico apparently leading to a temple, but this expectation will not be justified on approaching the side of the stand, where it will be seen that the portico rests upon the end of an oak half-timbered building, the surface of the oak being treated in a special manner. The interior will consist of two parts, one being an oak-panelled room, and the other part occupied by panelling executed in mahogany having solid figured panels and to be used in a contract the firm have secured for work in a large public building. The well-known "Anti-Cyclone" revolving door will also form an exit from this part of the stand.

Ewart & Son, Ltd. (346–350, Euston-road, N.W.1). **Stand No. 198, Row K.**

Geysers.—On this stand will be exhibited the "Califont" system of water-heating, which ensures an instantaneous and continuous hot-water service throughout the house, only one heater being required from which a hot-water service pipe can be taken direct to the bath, lavatory or sink; the opening or closing of the hot-water draw-off tap regulates the gas under the heater, and the gas only burns full on whilst the water is being withdrawn. Other exhibits will include the "Lightning" geyser, a standard pattern for bath and domestic use embodying automatic gas controlling valve and safety swing-out burner; the "Victor" geyser, a low-priced bath heater producing water rapidly and conveniently; geysers to heat by oil (paraffin) and fuel (wood or coal) for country districts where gas cannot be obtained; the "Emperor" cowl for the prevention and cure of down draught in chimneys.

The Expanded Metal Co., Ltd. (York Mansion, Petty France, Westminster, S.W.1). **Stand No. 151, Row G.**

Reinforcement.—This stand will show samples of the Company's products and examples of their uses; also photographs of various works carried out on its systems. The types of reinforcement include: (1) "Expamet" steel sheet reinforcement for concrete in foundations, walls, floors, roofs, bridges, culverts, silos, &c.; (2) RR. 6 in. mesh "Expamet" reinforcement for roadways, pavings, &c.; (3) "BB" and "Expamet" lathings for interior and exterior plaster work; also "Ribmet" ribbed lathing; (4) "Exmet" reinforcement for brickwork, concrete block work, partition slabs, asphalte, &c.; (5) mild steel wall ties for cavity walls; (6) section of culvert reinforced with "Exmet," sections of flooring reinforced with "Expamet," section of paving reinforced with RR. 6 in. mesh "Expamet"; (7) brick cavity wall to office reinforced with "Exmet."

Ermiloe, George, & Sons, Ltd. (34, St. John-street, London, E.C.1). **Stand No. 66, Row D.**

Builders' Merchants.—"Oceanic" and "Baltic" glass in white and many tints will be displayed, and a specimen board of lead goods which they manufacture. The stand will be decorated with "Father Thames" genuine white lead paint, white "Stargloss" enamel paint, and white "Eskimo" leadless paints. Two inside walls will be treated with red "Zingessol" washable water paint, and the panels on the exterior of the stand will display many of the tints in which this can be supplied. The firm will also show a small specimen of tile, slate and lead roofs to show how their "Mermetex" can be applied to repairing any kind of roof. Among sanitary goods a special feature will be made of "Lovaine" porcelain enamelled bath with porcelain enamelled fittings. They will also show their "O.C.G." brand of painting brushes and metal casements and leaded lights.

Fernden Fencing Co., Ltd. (Bridge-street, Guildford, Surrey). **Stand No. 41, Row C.**

Fencing.—"Fernden" cleft chestnut pale fencing, of British Standard Specification, will be shown; also a range of patterns in various heights suitable for all purposes; gates to their own registered designs; and selected seasoned timber, including British oak, larch, chestnut, fir, &c., suitable for fencing for every purpose. A speciality will be made of oak park paling, together with palisade, ornamental, post and rail, close boarded fencing, &c. Details of the "Fernden" hard lawn tennis courts will also be exhibited.

Ferodo, Ltd. (Chapel-en-le-Frith, Derbyshire). **Stand No. 60, Row D.**

Stair Treads.—This firm will show a full range of samples of their well-known fabric stair treads with several models showing methods of fixing nosings and treads to various types of stairs. These treads are specially woven from cotton and treated by a process which makes them exceedingly durable and long wearing. They are supplied in various colours which are permanent, and the material retains its non-slipping qualities and good appearance however well worn. Samples will also be shown of "Feroleum" nosings and flooring material, which are made from fine Para rubber and Ferodo fibre both corrugated and plain.

Gliksten, J., & Son, Ltd. (Carpenters-road Stratford, E.15). **Stand No. 91, Row E.**

Timber.—Messrs. J. Gliksten & Son, Ltd., intend exhibiting chiefly: Oak, teak, mahogany, American and French walnut, &c.

Greeff, R. W., & Co., Ltd. (Thames House, London, E.C.). **Stand No. 89, Row E.**

Paint.—Here will be shown "Kronos" titanium white, a new paint material made by the Titan Co., Norway. The capacity of this pigment, which is one of its chief characteristics, will be illustrated by various exhibits, including panels in which it is painted out over differently coloured backgrounds, showing the complete obliteration in one coat. The immunity of titanium white from discolouration by sulphur gases, &c., will form the subject of another demonstration; also its resistance to attack by corrosive gases and acids. Exposure tests of paint made with it will also be exhibited. "Wetordry" water-proof sand-paper will be shown in a large range of grades, from the finest garnet finishing paper to a coarse grit for cutting down the roughest filling.

Hoyle, Robson, Barnett & Co., Ltd. (Amen Corner, Newcastle-on-Tyne). **Stand No. 261, Row O.**

Paints.—This stand, which will house commodities of Messrs. Hoyle, Robson, Barnett & Co., Ltd., and Messrs. John Smith & Son (Haltwhistle), Ltd., will be simply designed, but will show the products of the associated firms in actual use. "Saneros," a useful water paint, "Protecteros," a high gloss finish with special qualities of density and lasting gloss, and Hoyle's semi-prepared paint, will all be shown in various ways on the exterior, while the interior will be given over to a variety of schemes in "Saneros" and "Hoyflat." The qualities of "Tynewhite," and the lustrous qualities of "Tynelac" and "Palusta," will be shown in the decorations and on panels. One half of the interior will be given over to a display of paint making on a machine made by the Brentside Engineering Co., Brentford, London.

Robt. Ingham, Clark & Co., Ltd. and R. Gay & Co., Ltd. (West Ham Abbey, E.). **Stand No. 140, Row G.**

Paint.—The stand representing the associated firms of Messrs. Robt. Ingham, Clark & Co., Ltd., and R. Gay & Co., Ltd., will be composed of five columns arranged around a forecourt having two offices at the back. The columns will be decorated with "Pearline" white enamel. The front of the offices, which will form a background for the white columns, will be decorated with "Gaymatt" flat oil finish of a deep blue colour. A feature of the exhibit will be a door which will occupy a central position, and which has been finished on one side with "Omnilac" varnish, while the reverse side will illustrate the use of flat enamel for interior decorative effects. The sides and back of the stand will be decorated with "Gaymatt" flat oil finish in various shades, while "Walgay" washable distemper will be used on the walls of the offices. "Impenetrable" paint will also be used in the exhibit, and panels illustrating the finish to be obtained with various other products of the firm will also be displayed.

Ironite Co., Ltd. (9 & 11, Old Queen-street, Westminster, S.W.1). **Stand No. 106, Row F.**

Cement.—The uses of "Ironite" cements for flooring and water-proofing will be exhibited. It is claimed that floors laid with this cement are wearproof, dustproof, waterproof and greaseproof, and that they are fire-resisting and repel acid and alkali. This cement is specially recommended by the makers for basements, cellars, subways, lift-wells, tanks, heating chambers, and similar places where there is possibility of damage by water or grease.

Kerner-Greenwood & Co., Ltd. (King's Lynn). **Stand No. 49, Row C.**

Waterproofer.—As at the last exhibition a prominent position on this stand will be given to the apparatus by which cylinders of cement and sand are subjected to water pressures up to 300 lbs. per sq. in. The cylinder of sand and cement waterproofed with "Pudlo" brand powder under test at that pressure for the whole period of the Exhibition will be broken open on the final day in view of all who care to attend. Other exhibits will demonstrate the waterproofing qualities of "Pudlo" when used with cement in mortar or concrete for excluding dampness or flood water from buildings or retaining water in tanks and reservoirs.

The Key Engineering Co., Ltd. (4, Queen Victoria-street, London, E.C.4). **Stand No. 267, Row O.**

Asbestos Roofing.—The principal exhibit of this firm will be a flexible roofing which is supplied in rolls, and can be fixed in exactly the same way as the various bitumen roofing felts on the market, but is made of asbestos woven into a compact felt in place of the organic materials of which the other roofing felts are made. Asbestos is an indestructible mineral so that instead of relying on the impregnating materials for the life of the roofing, the body of the felt is in itself permanent. Also, it is immune to the greatest heat or any action of chemicals in the air. This firm's floating ball steam traps for steam heating and cooking installations and also high-pressure work will be shown; also their samples of "Key" fibre conduit, an impregnated wood pulp pipe used for underground cable ducts and drainage.

Kleine Patent Fire-Resisting Flooring Syndicate, Ltd. (133–135, High Holborn, W.C.2). **Stand No. 116, Row F.**

Floors.—This firm, whose well-known flooring system is being so extensively adopted in all types of modern buildings, particularly office

buildings in the City and West End, where fire-resistance and strength are essential, are showing some typical samples of the different types. A new feature which has been recently introduced will be shown; this consists of a patented method of placing metal washers a certain distance on the rods to ensure that they will be properly covered in cement mortar or concrete, thus making the construction still more foolproof, and practically eliminating any possibility of defective workmanship.

Langley London (161, BOROUGH HIGH-STREET, LONDON, S.E.1). **Stand No. 157, Row H.**

Roofing Tiles.—The exhibit of this firm will include Marseilles, Beauvais, and Du Nord roofing tiles, for all of which they are the sole importers and distributors in the United Kingdom, and of which they carry stocks all round the coast and pay carriage to buyer's railway station, taking the breakage (if any) in transit.

Leeds Fireclay Co., Ltd. (WORTLEY, LEEDS). **Stand No. 101, Row E.**

Fireclay Goods.—"Burmantofts" terra-cotta will be displayed in a central feature, the construction of which will be carried out in several types and finishes of terra-cotta in order to show how this material lends itself to buildings of every class. The plinth of this central feature will be in glazed terra-cotta of a dark neutral blue shade, while the piers and arches will be in "Texture Marmo," the caps being picked out in gold. This "Texture" finish is a new application of permanent colour to architectural treatment. The chequered superstructure will be crowned by a lettered frieze in golden-crimson. A display will be made of Burmantofts "Lefco" terra-cotta fireplaces. The sanitary exhibit will comprise some examples of "Imperial" porcelain white-glazed fireclay ware in the form of a bath and "New Carlton" lavatory, with patent easy-clean porcelain enamelled iron non-discolouring valves, wastes, &c., suitable for public or private use. Together with these will be a w.c. suite, the seat of which is fitted with patent hygienic hinges, enabling it to be immediately detached for cleansing and disinfection. Glazed bricks, tiles, Claridge's asphalte (of which the Company are now the proprietors) will be other exhibits of this stand.

Linolite Composition Flooring Co. (FELSHAM-ROAD, PUTNEY, S.W.15). **Stand No. 45, Row C.**

Composition Flooring.—The Linolite Composition Flooring Co. will exhibit various types of jointless flooring, showing patterns and colours which they manufacture. As this material has now been in use for over seventeen years it will no doubt be familar to many, but a few details may be interesting to the general reader. Linolite is laid in a plastic state and forms a single jointless covering over the whole flooring area, making a solid bond with the foundation on which it is laid, whether wood, concrete, brick, tiles, stone, iron or metal. If desired the floor surface can be carried up the wall to any height, forming a jointless cone skirting or dado and eliminating the sharp angle where the floor meets the wall. Linolite has been used in every type of private and public building, and being fire-proof, damp and vermin-proof, coupled with its lightness in weight, can be used to cover any type of floor.

London Brick Co. & Forders, Ltd. (AFRICA HOUSE, KINGSWAY, LONDON, W.C.2). **Stand No. 128, Row F.**

Bricks.—The London Brick Co. & Forders, Ltd., will exhibit a building constructed entirely with fletton bricks, also samples of all descriptions of fluttons, rustic, white and other facings. Architects, engineers and builders are invited to avail themselves of the opportunity of inspecting this building brick, including such brands as the L.B.C "Phorpres," Forder and Stare. specifications may be had on application to the stand. This year the London Brick Company & Forders, Ltd., will make a feature of their multi-coloured ruff bricks. With this brick they claim to have solved the problem of producing a really cheap facing brick. The "Phorpres" flettons are produced by an entirely new machine recently invented for this purpose. The "Phorpres" multi-coloured ruff brick is made under a registered process, from material selected with the utmost care.

London Sand Blast Decorative Glass Works, Ltd. (BURDETT-ROAD, E.3). **Stand No. 281, Row P.**

Glass.—A comprehensive range of glass will be shown, including glass in different styles and periods; many for windows of banks, skylights (flat or bent), and removable screens for windows; a selection of mirrors, facias, stallboards and pilasters (plate glass in permanently vitrified enamels); illuminated signs of various sizes and shapes; opalite slabs for walls and fittings of bathrooms; plate glass (bevelled, polished and drilled suitable for table tops, shelves, &c.); direction plates and street name plates, interior reflector signs for shop windows, entrance halls, showcases, &c.

MacAndrews & Forbes, Ltd. (65, SOUTH MOLTON-STREET, W. 1). **Stand No. 265, Row O.**

Wallboard.—This exhibit will be a practical demonstration of the well-known "Fiberlic" patent wallboard for ceilings and walls. "Fiberlic" can be applied to ceilings and walls quickly and easily, and economical interiors can be obtained by its use with wooden fillets or mouldings. The material can be painted, stained, enamelled, or distempered; in fact, any treatment that may be applied to wood may be equally applied to "Fiberlic." The Ministry of Health has approved "Fiberlic" for use on any State-aided housing scheme. Immediately the board is erected the rooms are ready for occupation, as there is nothing to dry out as in the case of plaster. The many advantages that the board offers in the matter of general utility will be exhibited on the stand.

McNeill, F., & Co., Ltd. (BUNHILL-ROW, LONDON, E.C. 1). **Stand No. 184, Row J.**

Roofing Felts.—This firm will show an extensive variety of their "Lion" brand roofing and roof lining felts, including asphaltic roofing felt, sarking or slaters' felt, inodorous felt, black and brown sheathing felt. Particular attention will be drawn to the "Combinite" system of roofing for flat or sloping roofs. Models will be shown illustrating the uses of "Slagbestos" for cold storage and thermal insulation. There will also be shown pure bitumen damp-courses for housing schemes; pipe coverings, both of hair felt and canvas; "Slabgestos" with canvas backing; pure bitumen sheeting, for lining reservoirs, aqueducts, tunnels, swimming baths, miniature lakes, ponds, &c.; and "Styxol," a glossy enamel, for protecting and preserving iron and steel work, in black or red.

Mander Bros., Ltd. (WOLVERHAMPTON). **Stand No. 141, Row G.**

Paint.—Messrs. Mander Bros., Ltd., show a large pavilion decorated with their paint and enamel specialities, and have adopted a scheme of colouring consisting of columns in their black ebony finish, panels in cobalt violet "Vernasca," and stiles in egg-shell gloss white enamel, a large fascia being done in a shade of "Suffield Green." This, with the lettering in gold, and a touch of gold on the capitals of the Corinthian columns, will form a harmonious whole. The interior is decorated with aqualine water paint and egg-shell gloss white enamel, and shows a scheme of colouring in dove grey, pale apple green and cream, with a stencilled design in bright green on the panels, the whole forming an illustration of the effects obtainable with comparatively inexpensive materials.

The Marble Mosaic Co., Ltd. (LINMOS HOUSE, CHARLES-STREET, BRISTOL). **Stand No. 311, Row R.**

Mosaics.—This firm will show examples of their mosaics in marble and glass, terazzo, glazed and vitreous wall tiling, "Imperator" (registered) cast marble work for plinths, lavatory divisions, &c., and Linolith jointless flooring. A feature of their stand will be two types of flooring tiles in plain and ornamental patterns. The tiles are new to this country, although they are largely used in Italy. They are exceedingly hard, being made under hydraulic pressure. A large number of designs are available, and prices are moderate.

Moule's Patent Earth Closet Co., Ltd. (1½, GUILDFORD-STREET, LONDON, W.C.1). **Stand No. 39, Row C.**

Sanitation.—This firm will exhibit twelve specimens of their various designs, which embrace the three actions—"pull-out," "pull-up," and "self-acting." Also apparatus for fixing in permanent closets in the house or outside. Suitable for every conceivable requirement.

Parsons, Thos., & Sons (315–317, OXFORD-STREET, LONDON, W.1). **Stand No. 132, Row G.**

Paints.—"H.M.S. Endelline" will be shown again this year, and on it practical examples of Parsons' enamel, varnishes and paints, including: "Endelline" enamel, for interior or exterior use; "Endelflat" enamel (flat), for interior use, producing a soft and almost deadflat finish; "Lacreite" enamel, a cheaper product for either inside or outside work; "Unicote" flat finish, an innovation in wall decorative material, which shows that the surface can be repeatedly washed without deterioration; gloss paint, a varnish paint for general exterior and interior work; undercoating body white, a ready-mixed undercoating paint with a surface particularly adapted to take a finishing coat of gloss or flat enamel, and which can be tinted to suit the finishing colour; "Parso-Glaze," a scumbling paint giving excellent decorative effects; and copal varnishes, as manufactured by the firm for the past 120 years.

Perkin & Co., Ltd. (LEEDS). **Stand No. 13, Row B.**

Woodworking Machines.—Messrs. Perkin & Co. will exhibit a range of their wood-working machinery, but the chief item of interest on their stand will be a newly-patented device called the "Rapid" stair housing attachment, for use on a vertical spindle moulder. By means of this appliance it is claimed a pair of stair strings that would take a skilled joiner 8 hours to rout by hand can be done easily in 25 minutes. The marking-off is practically eliminated, and an excellent job is secured.

Potterton, Thomas (RAVENSWOOD-ROAD, BALHAM, S.W. 12). **Stand No. 46, Row C.**

Heating.—This exhibit will contain a selection of the standardised types of "Victor" gas boilers, and will give a working example of a system supplying hot water for general domestic use. A small installation for warming purposes, with circulating radiators heated by gas, controlled automatically, will be in operation as an instance of supplementary heating equipment for residence or offices, or as an example of treatment for small conservatories, greenhouses, garages, &c. Thermostats, for automatic regulation of gas consumption, both water-type and atmospheric-type, will be seen in action. The "Victor Combination" boiler, using coke or other smokeless fuel, or gas, which is specially designed to meet a need in private houses where a kitchen range is not installed, standard types of sectional boilers for central heating and applied equipment, and water treating plants for the elimination of impurities, &c., will also be demonstrated.

Ravenhead Sanitary Pipe & Brick Co., Ltd. (UPHOLLAND). **Stand No. 136, Row G.**

Bricks.—This firm will exhibit both interior and exterior decoration, the interior will consist of fire surrounds, &c., in their well-known "Rus" and Sandfaced bricks and blocks; the exterior will be in "Rus" for garden decoration, consisting of sundials, vases, garden ornaments, chairs, seats, paving, &c., all in hand-made and hand-carved work.

THE WEEK IN PARLIAMENT

Westminster, *Wednesday.*

The Rents Bill.

When the Standing Committee of the House Commons, which is considering the Labour nt Restrictions Bill, reassembled, it was ınd that the Attorney-General was present a member of the Committee. Discussion was ıumed on Lt.-Col. Fremantle's amendment, ich proposes to give local option to county l county borough areas, and municipal roughs and urban and rural district councils, relation to the continuance of control after 25. Eventually the amendment was defeated 42 votes to seven. During the discussion . N. Chamberlain mentioned that a return of nfidence among housing investors was be- ning under the 1923 Act, but he had received ters showing that the introduction of the new nts Bill had stopped the progress of housing erations.

The Evictions Bill.

Mr. Hayes asked whether the proposed islation to prevent evictions would extend otection to the tenants of Government operty ?

Mr. Wheatley said the provisions of the pro- sed Bill would apply to all houses at present thin the purview of the Rent Restrictions cts.

Foreign Cement.

In the House of Lords, Lord Banbury asked nether the refusal of the Unemployment rants Committee to make to the Middles- ough Corporation the usual grant towards ad-making, except on condition that they rchased English cement for the purpose, met th the approval of the Government. The rporation, he said, required 400 tons of cement l could obtain it from Belgium at about 42s. ton, while the price of English cement was out 53s. per ton.

Lord St. Davids, the Chairman of the Com- ttee, said that when there was a considerable ference between the British price and the eign price, Middlesbrough was allowed to rchase foreign cement, but when the prices proximated each other permission was with- d, and Middlesbrough could buy foreign ment with its own money, but the Com- ttee's grant should be spent in this country.

St. Paul's Bridge.

Sir E. Iliffe asked the Minister of Transport w much, if any, of the grant of £866,000, ocated to the cost of the road approaches to Paul's Bridge, would be available for the proaches on the south side of the river; what thority, if the scheme proceeded, would be ponsible for the preparation of the plan and execution of the work on the south side; ether any estimates of the total cost of the rk on the south side were before the depart- nt; and, if so, could he state the sum in- ded in those estimates for land and com- nsation ?

Mr. Gosling said that the estimate on which maximum grant of £866,000 was based was purely approximate character, and included rovision for the southern approaches, but he not in a position to dissect the figures. The k on the south side was covered in part by powers conferred on the City of London by Corporation of London (Bridges) Act, 1911; r parts of the work would fall within the iew of the London County Council. No prehensive estimates were at present before Department.

More Government Offices.

r F. Hall asked the First Commissioner of ks what was the area of unbuilt-on land een the buildings occupied by Government s in Whitehall Gardens and the Victoria ankment; what use was now made of this ; and whether he would consider the bility of having it laid out as gardens for ic use in extension of the Victoria Embank- Gardens ?

Mr. F. Hall, on behalf of the First Commissioner, said that the area of the land was about two acres. No use had been made of it since the demolition of the temporary hutments which were erected during the war. The First Commissioner feared it would not be practicable to lay out the ground as public gardens in view of the intention of ultimately developing the site for the erection of Government offices.

Building Materials.

Mr. Barnes asked whether the Minister could furnish a Return showing the increase in the price of building materials since January 1; and if he intended to ask Parliament for powers to control the manipulation of prices by rings and combines ?

Mr. Wheatley referred the Hon. Member to the reports for the months of January and February of the Chairman of the Inter-Departmental Committee appointed to survey the prices of building materials which had already been published as a Command Paper. He understood that a return showing the March prices was in course of preparation. As regarded the last part of the question, the matter was under consideration in connection with the Government's general housing proposals.

Replying to Sir K. Wood, Mr. Wheatley said it was quite possible that he would be able to make a statement on housing matters before the Easter adjournment.

Mr. R. Morrison asked what action would be taken with regard to the recent advances in the price of bricks, lead, and slates ?

Mr. Wheatley said that steps were being taken by the Committee on Prices of Building Material to investigate this matter.

Utility Societies.

Mr. Wheatley informed Lt.-Col. Fremantle that no information was available as to the number of houses erected by Public Utility Societies and Housing Trusts in 1913 or without State assistance during the years 1919–1923. The number of houses built with State aid in England and Wales by Public Utility Societies and Housing Trusts during each of the five years 1919–1923 was as follows :—

1919	17
1920	971
1921	2,266
1922	1,153
1923	132
	4,539

Town-Planning Schemes.

Major Ropner asked the Minister whether, in view of the sinking of proposed new pits and the need for the erection of new houses in connection therewith, he would, in those districts ensure, as far as possible, that town-planning on garden city lines were adopted by the authorities concerned in passing the plans for these structures ?

Mr. Wheatley said that he was anxious to encourage town planning schemes in areas of the kind mentioned, and this was being done in a number of cases.

Builders' Wages.

Mr. D. G. Somerville asked the Minister of Health if he would state the estimated effect on his housing proposals of the concession of the demand for an advance of 2d. per hour on the basic rate of builders' wages ?

Mr. Wheatley said he would suggest that the Hon. Member should reserve his point until he was in a position to make a statement on the Government's proposals in regard to housing.

The Subsidy.

Mr. Wheatley informed Mr. Alstead that under the Housing Act, 1923, the State subsidy was equivalent to about £75 per house and provision was made for further subsidy by local authorities. Up to March 1 2,552 houses had been completed by private enterprise with the aid of subsidies under the Housing, &c., Act, 1923, and a further 13,737 were in course of construction. In addition local authorities had issued certificates on approval of plans as eligible for subsidy for a further 24,771 houses.

Building in Blocks.

Mr. Alstead asked the Minister whether he had received any applications from municipal bodies or others to be allowed to build small dwellings in blocks of six or more; and, if so, what was the attitude of the Ministry to such applications ?

Mr. Wheatley said he did not require local authorities to submit to him their proposals for housing schemes under the Housing, &c., Act, 1923, in such detail as the Hon. Member indicated. The numbers of houses which it was desirable to include in a block would depend on the nature of the site and the lay-out, but he was advised that continuous blocks of more than six or eight were not ordinarily desirable.

The Limit of Space.

Mr. Alstead asked the Minister if he was willing to consider the removal of the present limit of 950 superficial feet now fixed in the regulations appertaining to the erection of houses under the subsidy scheme ?

Mr. Wheatley replied : No, Sir.

1923 Results.

Mr. Wheatley informed Mr. Becker that it was estimated that during the year ended September 30, 1923, some 77,000 houses were erected.

Skilled Labour Supply.

Mr. Shaw, Minister of Labour, informed Miss Jewson that the plastering class at the Government Instructional Factory, Norwich, closed in November, 1922, and the bricklayers' class closed last October. Their equipment had been dispersed. The question of the supply of additional skilled labour for the building trade was under consideration by a Committee of employers' and operatives' organisations in that industry.

Another Rents Bill.

On Monday Mr. Wheatley introduced the Rent and Mortgage Interest Restrictions Bill, the object of which is " to amend the provisions of the Rent and Mortgage Interest Restrictions Acts, 1920 and 1923, so far as they relate to restriction on the right to possession."

The Rating Bill.

Mr. Wheatley stated that observations on the draft Rating and Valuation Bill had been submitted by the majority of the representative Associations of Local Authorities and other interests concerned to which the draft Bill was circulated, and were under consideration in his department. He was not at present able to indicate when it would be possible to introduce legislation on the subject.

Housing.

A statement by the Minister of Health on the Government's housing policy is given on p. 563.

According to returns obtained from local authorities in 1919, 2,292 houses were stated to be required during the three subsequent years in the areas of rural district councils in the county.

Under the 1919 Act 806 houses were erected by local authorities and public utility societies in the areas of rural district councils in the county, and under the Housing (Additional Powers) Act, 1919, 543 houses were erected by private builders. 533 houses were included in schemes of rural district councils in the county which had been authorised under the Housing, &c., Act, 1923.

The Engineers' Draughtsman. By H. Varlen. (London : G. Routledge & Sons, Ltd.) 5s. net. The aim of this book is to show in outline the governing principles which underlie mechanical draughtsmanship, and to illustrate the uses of a drawing for conveying information and instruction in the making of machines. Although the volume is intended primarily for mechanical engineering, it contains much that will be suggestive and of interest to those engaged in the structural branches of engineering.

THE BUILDING TRADE

THE SUPPLY OF OPERATIVES IN THE BUILDING INDUSTRY

By T. P. BENNETT

THE housing programme which is being laid down by the present Government, coupled with the steady improvement in trade which is taking place in the country, is again bringing into prominence the question of the ability of the building industry to supply the labour required to erect the commercial buildings and houses which are needed. The study of this subject is hedged around by a large number of difficulties, and it is hard to find evidence which is sufficiently conclusive to form the basis for calculating an adequate yearly supply of labour.

The subject may be divided into five sections, *viz.* :—

1. The number of operatives at present in the industry, compared with the number in previous periods. The most reliable and complete comparison in this case is obtained from the census returns of 1901, 1911, 1921.

2. The average working life of the operative. From this information will be obtained the basis for calculating the yearly supply of apprentices.

3. The amount of labour required for a specified yearly building programme. This may be based upon (*a*) the Government housing programme; (*b*) private housing activity; and (*c*) commercial building.

4. (*a*) Conditions of entry into the building industry; (*b*) restrictions upon the number of apprentices engaged; (*c*) the conditions of work in the building industry which affect the number of those entering.

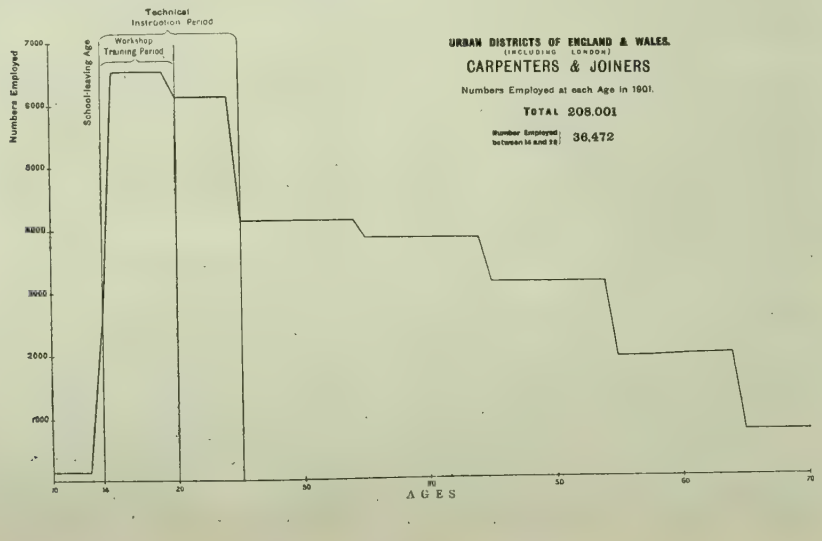
5. Methods of training which are possible under present circumstances, and alternative methods of training.

1. From this summary it is evident that the first portion of an inquiry into the supply of labour for building must be directed towards an inquiry into the number of men engaged in building; and coupled with this inquiry, must be the examination of the number who were engaged in the industry in previous years and an examination into the ages of the men. By this means it will be possible to discover whether sufficient young men are continually taking up building, and whether the normal number of operatives is still in the industry. In the five key trades of building, *viz.*, bricklayers, carpenters and joiners, plumbers, plasterers and decorators, the following total figures are given:

England and Wales.

	1901.	1911.
Bricklayers	115,995	102,752
Carpenters and joiners	270,660	208,995
Plumbers, excluding gasfitters	64,924	64,968
Plasterers	31,301	25,082
Decorators, including painters, glaziers, paper hangers, and whitewashers	166,638	190,523

(The figures for 1921 are not yet available to the public.)



It is generally accepted that the number of men engaged in building in 1921 was substantially below the total in any previous year, and it will be seen from the above figures that, even in 1911, the vital trades of bricklaying, carpentry and joinery, and plastering had a substantially smaller number of operatives than in 1901. The census figures for the Administrative County of London are, however, more complete, and from them the following table can be obtained (Table A):—

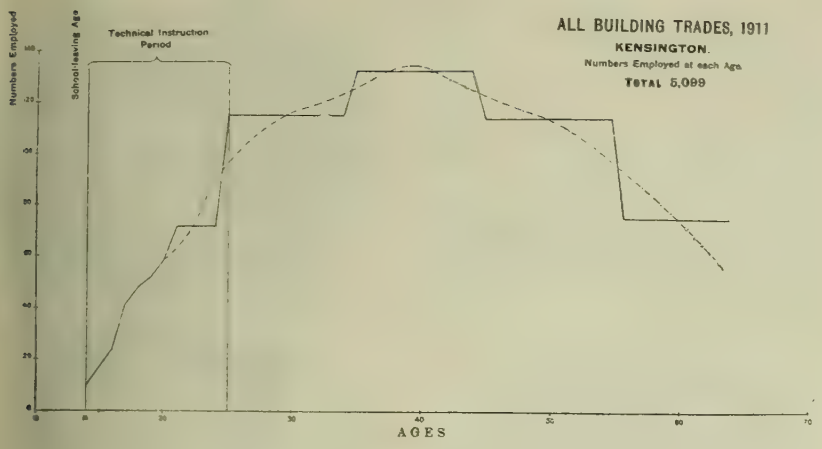
TABLE A.—ADMINISTRATIVE COUNTY OF LONDON.

	1901.	1911.	1921.	
Bricklayers	13,726	25,928	15,019	9,233
Labourers	12,202		(including Labourers)	
Carpenters and Joiners	32,934	20,172 (including Labourers)	18,459	Labourers not included: average proportion per cent., 461: total 18,9
Plumbers, excluding Gasfitters	10,766	8,582	—	Category which listed yet discovered
Plasterers	5,160	5,981	Not given separately	2,936 Including Labourers.
Labourers	821			
Decorators, including Painters, Glaziers, Paper Hangers and Whitewashers	38,343	40,925	29,456	Presumably 3,659 "oth workers": to 33,115.

TABLE B.

	1901. Under 25.	1901. Over 25.	1911. Under 25.	1911. Over
Bricklayers	3,024	10,702	1,076	13,9
Labourers	2,953	9,249	(including Labour	
Carpenters and Joiners	7,987	24,947	2,504 (including Labour	17,0
Plumbers, excluding Gasfitters	4,006	6,760	2,170	6,2
Plasterers	1,306	3,854	Not given separa	
Labourers	266	555		
Decorators, including Painters, Glaziers, Paper Hangers and Whitewashers	5,746	32,597	4,386	36,2

These figures show that in 1921 the operative in the whole of the building trades had decrease seriously, in some cases there were less than ha the number of operatives who were workin twenty years before. It is possible that the figures do not accurately represent the pr portional decrease for the whole of the countr The census is compiled upon a residential bas and it may be that more operatives live outsi the county of London than previously liv within its boundaries. When the cens figures for the whole of the country for 19 are available it will be possible to make a mo accurate statement. It is, however, evide that the depletion of operatives places Lond in a serious position in connection with t execution of building work.



The next point which is of vital importan is the average age of the operative, because there are not substantial numbers of young m coming forward, and the industry is bei constantly depleted, the position must eve tually be disastrous. The age groups of t Census Returns for 1901 and 1911 give t following figures (Table B).

The age groups for the Administrative Coun of London for 1921 are not yet available, a

comparison is, therefore, incomplete, bu 1911 the proportionate number of opera under 25 years of age was considerably less was the case in 1901; in other words, a larger number of old men were being empl even at that date, and there is reason to be that the number of middle-aged and old employed is much greater than it was in 19

From the foregoing information it is that building now maintains a far sm number of operatives than it has for 20 y in spite of the fact that the prospective bui programme appears to be larger than ever be This is a matter which requires serious consi tion, not only at the moment, but permane because the operative requires a lengthy trai

2. Before it is possible to consider the nu of apprentices who might reasonably be sorbed per annum, it is necessary to fin average length of working life of an oper The *Expectation of Life* tables obtained fro Prudential Assurance Company show tha average length of life of all males is 62.3 and that the variations of the expectation

the principal workers in the building trades as under :—

Carpenters and Joiners	+2.0
Bricklayers, Masons, Builders	+1.1
Paperhangers, Plasterers, Whitewashers	+−0
Slaters, Tilers	—1.1
Plumbers, Painters, Glaziers	—0.9

From this it will be seen that the building trade workers live, on an average, to the average normal span of years.

Variation from the Expectation of life to the Expectation of Working Life.—The graphs given in the Report by Mr. J. C. Smail on the Training and Employment of Boys in the Building Trades in London, published by the L.C.C. in April, 1914, indicate that the expectation of working life of the building trade operative is substantially below the total expectation of life. These tables should be examined in detail, as they convey extremely valuable information, on which may be stated as a very rough guide that the average expectation of life is 50 years, and assuming the age of entry to be 14 years, the duration of working life will be 36 years, and subject to confirmation by separate investigation, this would appear to be the figure which should be taken for calculating the total yearly wastage in the industry. A further comparison of these graphs indicates quite unmistakably the remarkable migration of operatives in building from the provinces to London. The graphs for the urban and rural districts of England and Wales (graph 1) show the maximum number of operatives to be between the ages of 15 and 20, but the maximum number of operatives in the London Boroughs shows a progressive increase which in many trades rises to the age of 40 and shows its maximum at that date (graphs 2 and 3). These tables prove conclusively the assumption which has been made on innumerable occasions, that the London building trade employer has not hitherto trained the operatives who are engaged in the building industry in London. If it is assumed that the adjustment of wages and the introduction of "" grade towns will automatically restrict, or even eliminate the migration of the provincial operative to London, then it is evident that the urgency for the training of operatives in London is a vital problem.

Combining the census figures with the working life of 36 years, the yearly number of apprentices in London, assuming the number of operatives given in the 1921 census to be adequate, would be as follows :—

	Crafts-men.	Appren-tices.
Bricklayers	6,787	188
Carpenters and Joiners	18,459	513
Plumbers*	—	—
Plasterers	2,532	70
Operators, including Painters, Glaziers, Paperhangers and Whitewashers	29,456	818

* Not available.

It should be particularly noted that this is the number of Apprentices required to make good the wastage of the seriously depleted number of craftsmen at present resident in the Administrative County of London. It does not allow for any increase in the total number of operatives and it may be found later to be quite insufficient to deal with the number of Operatives required in London and its immediate environs, as possibly London Operatives are now largely resident in suburban districts which are not included in the County of London figures.

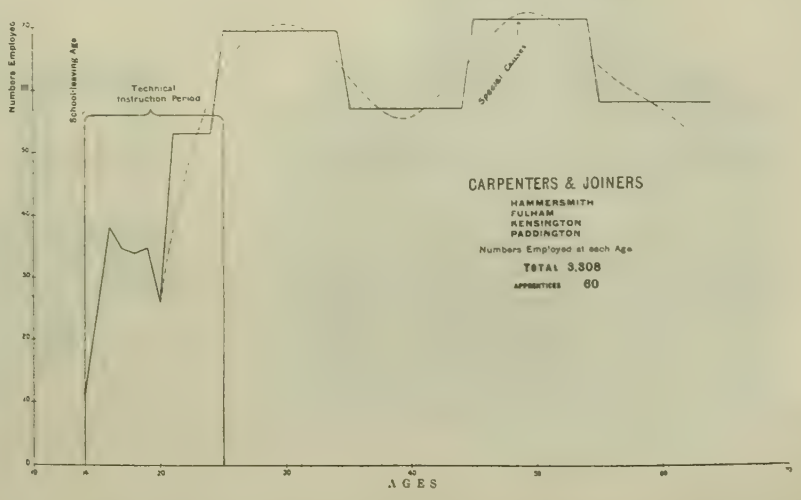
THE "SYMPATHETIC" STRIKE

The present state of affairs in the industrial world must draw popular attention to the question of what is termed the "sympathetic strike." The Trade Unions have obtained after a prolonged struggle the right to use the strike in order to be in a position to secure what they consider reasonable terms of employment for their members, and under the Trade Disputes Act, 1906, they were given a privileged position enjoyed by no other body in the Kingdom as regards the law.

Labour in past times having been oppressed by stronger bodies, public opinion recognised that they should be placed in a favourable position to bargain on what terms they should be employed, or in other words, sell their labour.

They have not only been placed in a favourable position, but in a privileged position, in many respects outside the powers of the law of the land, and they are enabled to use the force of the strike to obtain the terms they desire and which they consider the reasonable reward for their labour.

As between the direct employers and their workmen this has become the accepted state of affairs, and there is little doubt that unless the Unions use their powers improperly they will be allowed to retain that privileged position; for the nation has come to recognise that the "labourer is worthy of his hire." But the sympathetic strike appears to stand on an entirely different footing. Men who have no grievance against their own employers are brought into a dispute which in no way affects themselves, or their own earning power, and this at once lends a sinister attitude to the dispute for it introduces a new motive which can only be an attempt to intimidate the public.



This is an outcome of the Trade Disputes Act which can hardly have been foreseen when that measure was passed in 1906. The Conspiracy and Protection of Property Act, 1875, made an agreement, or combination, by two or more persons, to do, or procure to be done "any act in contemplation, or furtherance of, a trade dispute between employers and workmen" not indictable as a conspiracy, and we believe those words were interpreted as indicating that there must be a dispute between the parties directly concerned. However this may have been it is clear that the Legislature which desired to confer extended powers on the Unions in 1906 considered they might bear that interpretation, for in the Trade Disputes Act, 1906, section 5 subsection (3) the following definition was introduced :—"In this Act and the Conspiracy and Protection of Property Act, 1875, the expression 'trade dispute' means any dispute between employers and workmen, or between workmen and workmen, which is connected with the employment, or non-employment, or the terms of employment, or with the conditions of labour of any person, and the expression 'workman' means all persons employed in trade or industry *whether or not in the employment of the employer with whom a trade dispute arises*, and in section 3 of the last mentioned Act the words 'between employers and workmen shall be repealed.'"

Here we have the legalisation of the "sympathetic strike," which enables workmen with no grievance of their own as against their own employers to lend their support to an industrial dispute, and to claim the immunity granted by the Trade Disputes Act from legal process and to put in force the powers conferred by that Act. It is becoming a question whether such powers of striking should be conferred upon men who resort to force when they have no complaint of their own against their employers, but with the sole view of intimidating the other employers and the public, and indeed whether such powers conferred on a limited body are consistent with the conditions of a highly civilised community.

The public will claim to be entitled to a little of the "sympathy" displayed in the "sympathetic strike," and the Government which is championing world pacification must look askance at the readiness of certain sections of their followers to resort to force by the strike against their own fellow citizens.

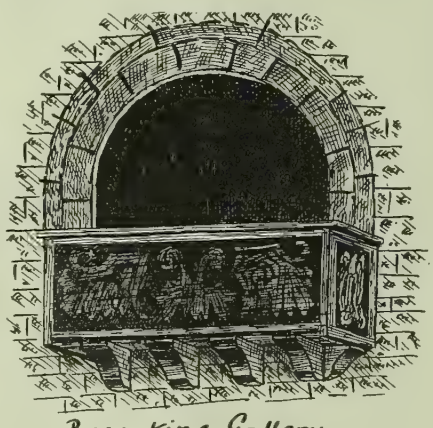
Builder's Estate.

Mr. William Lindsay, of Newton-place, Glasgow, brickbuilder and contractor (personal estate), £25,363.

THE ROMANCE OF BUILDING THROUGHOUT THE AGES.—V.

The fifth lecture * on "The Romance of Building Throughout the Ages," delivered by Mr. George W. Thompson before the junior members of the Amalgamated Society of Woodworkers (Liverpool), dealt with the Early Christian, Byzantine, and Romanesque periods.

The lecturer said in the first century A.D. Rome was called "The Mistress of the World." Its Emperor—Augustus Cæsar—boasted that he found it a city of brick, and that he would leave it a city of marble.



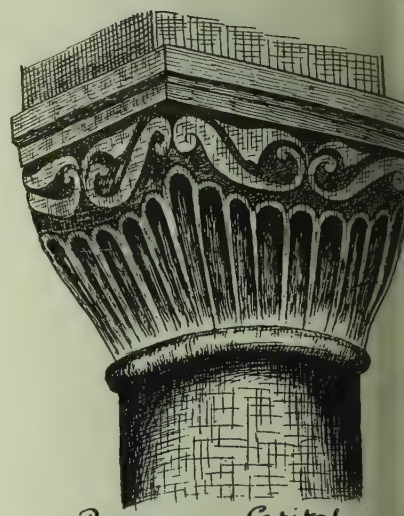
Just about this time, when many temples and statues were being built in honour of heathen gods, the most important human event in the history of the world occurred. Far away in the Eastern city of Bethlehem a little child was born, and His coming was soon to change the subject of art from heathen to Christian. Instead of temples housing Jupiters and Minervas the Christian Church arose decorated with statues and pictures representing the Madonna and Child, the saints and angels, and holy men and women. But it took centuries for this change to be fully brought about.

Christians were persecuted in heathen Rome. Emperors who called themselves gods and desired to be worshipped did not welcome Christianity with its teachings of humility and patience. So the poor Christians, in fear and distress, were forced into the stone quarries under Rome. There they dwelt and worshipped, and died, and were buried.

It was in these catacombs that Christian art began. Upon the walls of the catacombs pictures and carvings were made, *e.g.*, Moses striking the rock, Daniel in the lion's den, Jonah and the whale.

In A.D. 313 Constantine issued from Milan his decree which accorded to Christianity equal rights with all other religions. Afterwards Christians were allowed to worship as they chose, but they refused to use the heathen temples. Thus they were permitted to occupy the basilicas, or halls of justice—named after Basileus, a Greek ruler. These had flat roofs and long, wide halls separated into aisles by rows of pillars. The middle aisle was called nave. At one end was a semi-circular raised platform called an apse. Worshippers stood in the nave and the clergy occupied the apse. Christians imitated these buildings when erecting their first churches. When the apse contained a bishop's chair the church was called a cathedral (cathedra—chair).

These churches became popular. They were more and more decorated inside. The altar was erected on the apse, and seats for bishop, clergy and choir were added. Artists painted incidents in lives of saints on the walls and ceilings, this being done to make the story of saints familiar to those unable to read.



Byzantine Gallery

All Christian churches of the present day contained traces of Roman basilicas.

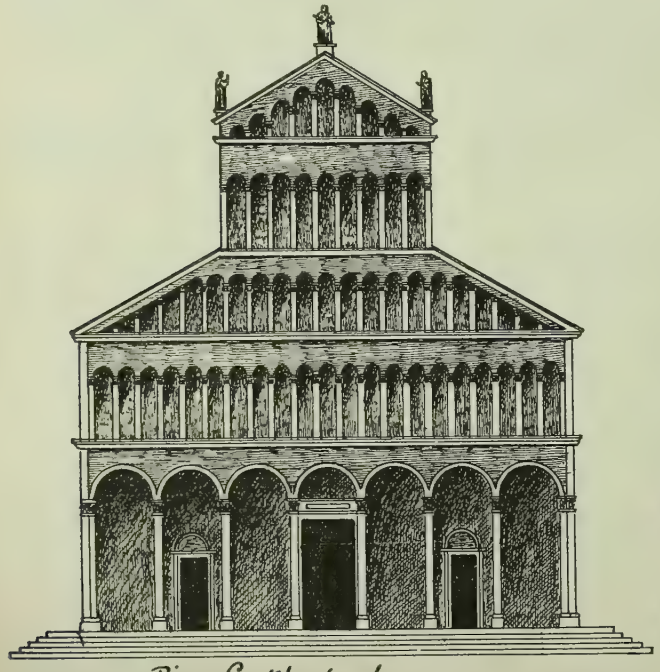
Byzantine.—The capital of Rome was changed to Byzantium (Constantinople) in A.D. 324, by Constantine. The Byzantine style of architecture was practised until Constantinople fell into hands of Turks in A.D. 1453, when it became the capital of the Ottoman Empire.

The dome was the chief feature in Byzantine architecture. These were placed over square apartments, whose bases were brought to a circle by means of pendentives. Rome used domes over circular apartments only. Bricks were used freely in the construction of walls, but the core of walls, as in the Roman period, was generally of concrete. Interiors were always lined with marble and mosaics, or decorated with paintings.

Windows and doors usually had semi-circular

Romanesque Capital

heads, but segmental and horseshoe arches w sometimes employed.



Roofs were composed entirely of do formed in brick, stone, or concrete. Colu were based on Roman Doric and Corinth types, but capitals and bases were distinguis by their "flat" appearance. Incised fol was popular for capitals. Mouldings playe unimportant part in this style. Effect obtained by employing broad flat expanse richly decorative wall surfaces. Mosaics elaborate in the extreme, consisting of colo glass enamel.

St. Sophia was built by order of Justi A.D. 532–537. The great central dome 107 ft. in diameter. In 1453 the follower Mohammed changed it into a mosque. mosaics were plastered over, and above t were placed shields bearing texts from Koran. The cross was displaced by the cres and it still remained a Mohammedan mos

St. Mark's, Venice, A.D. 1063–1071, was by the great wealth of the Venetian merc princes. The facade was a grand mosaic scr Arches were inlaid with mosaic pictures, above the façade rose slender turrets with statues of the saints. The Campanile, or tower standing in piazza in front of St. Ma 300 ft. high, fell in 1902.

Romanesque.—This style grew up all western Europe after the decay of the R Empire. Towers were special features: were either square, octagonal, or circular,

on of Building Trades Operatives),
s Sir Sydney Wells, spoke on "Build-

ennett stated that, but for the strike,
uld have been an audience of 900 there
t, instead of about 500.
rdney Russell Wells then distributed
s to the successful students. In the course of his remarks, he said he had been interested in seeing there a departure from custom, in that none of the students knew who were prize-winners until it was announced that night. That was like life. None of them knew who were to be the prize-winners in life's career. They were all interested in some aspects of the building trade. When they tried to understand old civilisations they examined the bones of the men of old. Another way was to look at the buildings they inhabited, which expressed their outlook. Buildings were the pictures of the spirits and the souls of men.

The earliest buildings were the remains of Stonehenge, representing the devotion of the people of long ago. As architecture varied from age to age they got an idea of how man's religious feeling had varied. It must have been infinitely higher when they built Salisbury Cathedral than when they built Stonehenge. It was interesting to think of the houses of the people in the days when Salisbury Cathedral was built. Evidently men then looked upon their time here as a more temporary thing than they did to-day, when home represented the individuality of the people. Their houses were certainly better than those of the past. One of the most fundamental things making for the health and happiness of the people was healthy houses, and this depended upon the practical work of the builder.

The students there, he said, had a great duty to the State and to their fellow-men, in so far as they built and designed houses that made for the betterment of the people. All their varied aspirations in life were an expression of the desire for happiness in life, that was the sense that one had done a job worth doing and done it well, feeling they had done it without others telling them. Such a form of happiness was due to every one of the students there, and the sense of having done their job well would bring other joys. He congratulated students and teachers on their work and the governors upon the noble institution in which they worked.

The proceedings closed with the usual votes of thanks.

Wages in the Building Trade.

A conference of the Executive Committees of the various unions coming under the National Federation of Building Trades Operatives was held at Golder's Green recently. There were about 150 delegates present from all parts of England. The proceedings were private, but we understand that the Conference decided to reject the employers' offer of an advance of one half-penny an hour, with certain alterations in the working conditions. Further negotiations, however, will take place between the parties.

Building Strike at Wembley.

A mass meeting of the building operatives employed on the site of the British Empire Exhibition at Wembley recently decided to cease work immediately. A claim was put forward by the men for the payment of an extra twopence an hour. Some of the speakers declared that they were desirous of taking advantage of the position to force the hands of the employers. One of the shop stewards, addressing the men, said if they did not strike at once their opportunity would be lost. It was then decided to strike. About 7,000 men are involved.

Mr. R. Coppock, of the National Federation of Building Trade Operatives, stated that the strike was not official. "One of our officials," he said, "went to Wembley to-day to address the members of our federation in order to explain the position and to endeavour to placate them. They declined to be placated, however, and announced their intention of ceasing work that evening. While the official was addressing the men a policeman escorted him off the grounds on the instruction of the Exhibition authorities."

COMPARISON OF PRICES OF BUILDING MATERIALS BETWEEN AUGUST 4, 1914, AND MARCH 31, 1924

GOVERNMENT HOUSING SCHEME

It is stated in the Press that the Government proposes shortly to set up a Statutory Committee composed of representatives of building trade "manufacturers," building trade operatives, and building material manufacturers.

The community will be directly represented through representatives from the municipalities.

This Statutory Committee will be responsible to the Government for carrying out a programme of three million houses in all details except finance, which will be dealt with by the Treasury and the Ministry of Health.

The report of the preliminary Committee deals with three main features:—The cost of houses to be built; the supply of labour, and the supply of material.

On the question of cost the Committee recommend that the minimum floor space of any house built under the scheme should be 850 super ft., and the cost not more than £450 per house. Houses of 950 super ft., the Committee state, should not cost more than £515 per house.

The shortage of labour in the industry is to be dealt with by a national apprenticeship scheme. In each district where houses are built each contractor is to receive a proportion of the work to be done. To obviate dilution and to augment the supply of labour, if necessary, the unions have agreed that apprentices of twenty years of age shall only serve three years' apprenticeship instead of the longer period demanded, and those of nineteen four years, at rates of pay already laid down.

The report suggests that the control of building material prices can be made by an adjustment of what are known as "on costs." This is explained by a statement that the continuity and regularisation of work that will accrue under the scheme will have the effect of spreading over a greater amount of work than at present "on cost." Any present or future increase of cost both of labour or material will be met by the larger volume of work, which will, of course, equalise the total cost of production. The Committee suggests that the Government should take into consideration the question of securing reductions in the freight rates of coal and building material.

Manchester's Housing Scheme.

In connection with the strike of municipal paviors at Manchester the whole of the Corporation building trade employees, with whose Union the paviors are associated, struck work recently, the result will be that all work on housing contracts, involving 1,600 houses, will be stopped, and that shortly associated industries like plumbing, painting, plastering, and joinering, will be affected.

The paviors employed in the various departments ceased work a few weeks ago, because it was sought to class them as engineering instead of building trade employees. They claimed that the alteration involved a serious extension of hours, a change which they declared they would oppose at all costs.

£20,000 for Plymouth Housing.

Lady Astor, M.P., has written to the Mayor of Plymouth defining the amended offer which she and Lord Astor are making to the town of gifts to form a housing trust. She offers the sum of £10,000 and Lord Astor an equal amount. The Town Council is to purchase, if necessary, the land considered most suitable for building (a site is suggested), and is to contribute up to £50 per house for the construction of roads, &c.; it is also to pay the Government subsidy to the trust. The Housing and Town Planning Council and the Garden City Association have offered help in preparing an outline for the development of the scheme, and numerous offers of help have been received from architects, builders, and others. After the scheme is started, it is proposed to appoint governors to administer the fund, two of these being the Mayor and the Chairman of the Housing Committee.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.

TRADE NEWS.

Mr. Charles Ingram Perkins (the eldest son of Mr. Wm. Charles Perkins, governing director of Messrs. Ingram Perkins & Co., Ltd., timber merchants, 37, Beech-street, E.C.1.) has been appointed a director of the company.

In the announcement regarding the well-known Hutchinson Tyres which appeared in our advertisement columns last week it was inadvertently stated that these solid tyres are guaranteed for 1,200 miles. This was an obvious error, the guarantee being for 12,000 miles, or 15 months. The address of the firm is Hutchinson Tyres, Hutchinson House, 119-125, Whitfield-street, S.W.1.

Musgraves, Ltd., sanitary engineers, extend an invitation to architects and others to visit their new show rooms at 49A, Rathbone-place, Oxford-street. Attention may be drawn to their special food locker, made of white porcelain enamelled fireclay. These lockers are suitable for bungalows, flats, mansions, or institutions. They can be built into the wall, and they are hygienic and thoroughly ventilated. The shelves are loose wire grids, removable, and so ensuring absolute cleanliness.

National Gallery.

The Gallery was closed to the public on Wednesday, April 2, when the Trustees held a reception in connection with the centenary celebrations. Room XXI is now specially hung with a representative group of the Gallery's earliest acquisitions, arranged in the manner customary a hundred years ago. Early acquisitions elsewhere in the Gallery are distinctly labelled. Visitors are thus able to see the relative value and importance of such pictures as those of the Angerstein Collection, the Beaumont Gift and the Holwell-Carr Bequest. In addition, gifts made to the Gallery to celebrate the centenary are on exhibition. The Gallery thus arranged was re-opened to the public on Thursday, April 3rd. From now onward the collection will be open free on Mondays, Tuesdays, Wednesdays and Saturdays, and on Sunday afternoons.

In connection with their centenary celebrations the Trustees have received a gift from Mr. C. Morland Agnew of a portrait by Raeburn representing the well-known statesman, Henry Dundas, first Viscount Melville (1742-1811), the bosom friend of Pitt.

PROPOSED NEW BUILDINGS & OTHER WORKS *

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

Ashton-in-Makerfield.—Plans approved: Two bungalows, Naylor-street, for Mr. T. Harrison.

Barber, bungalow, Norheads-lane, Cudham; Bromley B.G., nurses' home, Wellbrook-road, Farnborough; Mr. E. J. Hawkes, bungalow, St. Peter's-road, Orpington.

Burnley.—The M.T. recommend the Corporation to proceed with part of the construction of the proposed new road, from Colne-road to Brunshaw-road, at an estimated cost of £49,500.

Cambridge.—A reversionary bequest, which it is estimated will exceed £75,000, is left to Downing College, Cambridge, by Mr. Sidney Wynn Graystone, of 57, Knightsbridge, S.W. £5,000 is for a chapel; £5,000 for the erection and equipment of a Graystone library, such library to be rather a reading and recreation and smoking room for the use of students; and the balance for further buildings to be called the Graystone Block.

Cardiff.—The directors of the G.W.R. Co. announce important alterations at Cardiff Docks Station. These comprise the provision of a platform 700 ft. long by 30 ft. wide adjoining Bute-street, to be served by two lines, improved signalling, and goods receiving office with sidings. Two mileage and exchange sidings capable of accommodating a total of 176 wagons will replace the accommodation absorbed. It has also been decided to construct a new goods shed at Ely, together with a mileage yard and horse loading bank for racehorse traffic, and two sidings with independent road access.

Carlisle.—The Health Committee has approved plans for the erection of 32 houses in different parts of the city by private enterprise.

Castleford.—Plans passed: House, Smawthorne-lane, for Mr. L. J. Gallagher; new cinema, Church-street, for the Albion Picture Co.——A scheme has been approved for the reconstruction of the Open Market, whereby new conveniences are to be erected and an arcade of shops built.——The sewers in Fulford street and Herbert-street are to be relaid at an estimated cost of £260.

Chester.—It is proposed to construct a "ring road" round the city for heavy motor traffic.——A sub-committee has been formed to consider the provision of a site for a public hall.——It is proposed to acquire sixty acres of meadow land for providing playing fields.

Chorley.—The Council is to proceed with the proposed extensions to the Chorley main sewerage works at Commons Bank, estimated to cost £50,000.

Clitheroe.—The R.D.C. are proposing to acquire the Whalley Water Works, for which their Consulting Engineer is preparing a scheme of improvement.

Derbyshire.—The E.C. has approved of plans for the erection of new schools at Finbern, Shuttlewood, Stonebroom and Dronfield.

Doncaster.—The Corporation are about to start upon a scheme for the improvement of the shopping centre in town. All the shops from Red House and the corner of St. Sepulchre-gate and West Laith gate, extending to the Arcade in St. Sepulchre-gate are to be rebuilt, thus allowing the frontage line to be brought back 40 ft.

Dudley.—Plans passed by T.C.: Mr. J. Ravenhall, house, Northfield-road, Netherton, Dudley; Mr. W. H. Jakeman, shop and house, corner of Churchfield-street, and Furnace-row, Dudley; Mr. L. Smith, house, Oakham-road, Dudley; Mr. F. Law, house and shop, Adshead-road, Dudley.

Dukinfield.—Details of the proposed housing scheme on land off Birch-lane have been forwarded to the M.H. for sanction.

Eastleigh.—The U.D.C. proposes to extend its offices at a cost of about £12,000.

Edeyrnion.—Extensive works are to be carried out at the Cynwud Waterworks, estimated to cost £1,500. Operations are to be commenced at once.——The new waterworks at Carrog are also to be proceeded with.

Edinburgh.—Warrants granted by Dean of Guild Court: Elder & Wilson, 15 bungalows at Wardie; David Jamieson, house at Lanark-road, Colinton; Kirk-Session of Colinton Parish Church, church hall and office at Dreghorn Loan, Colinton; Henry Cairns, to erect bungalow at Allermuir-road, Colinton; James Fleming & Co., Ltd., factory, &c., at 19, Albert-street, Leith; Thomas Dunbar, coach-house and garages at East Trinity-road; A. B. Fleming & Co., stores at Caroline Park, Granton; St. Cuthbert's Co-operative Store, ovens and reinforced concrete floors and slab doorways at bakeries at High Riggs, Fountain Bridge.

Eye.—The T.C. has before it a scheme for the conversion of the old workhouse buildings into dwellings. Mr. H. Hooper, architect, Ipswich, is reporting on the matter.

Foleshill.—The R.D.C. has approved of the following subsidies: Coventry Colliery, Industrial Housing Co., Ltd., 34 houses; C. Smith, Exhall, 2; Coventry Colliery Industrial Housing Co., Ltd., 70; W. Leyland, Coventry, 1; H. Smith, Collycroft, 2; and Messrs. Pearson and Burden, 2.

FIRE.

BRADFORD.—Damage to the extent of many thousands of pounds was caused by a fire which burned out mills at Thornton, occupied by Messrs. Priestleys, Ltd., and Messrs. Mark Dawson & Sons.

MR WHEATLEY ON HOUSING.

DURING the discussion on the second reading of the Consolidated Fund Bill, Mr. N. Chamberlain raised the question of housing, and asked the Minister of Health what progress had been made under the 1923 Act. He also urged that the Government should encourage tenants to buy their houses.

Mr. Wheatley, in reply, said that in regard to the adequacy of the subsidy no general complaints had been received with regard to it. But there had been strong complaints from rural districts, and in that part of the country most affected by bad housing conditions—Scotland—the Act had been practically a dead letter, and had contributed nothing to the solution of the housing problem. If the Scottish authorities had not complained it was because they had come to the conclusion that no useful purpose could be secured by doing so. With regard to the forms of assistance granted, out of a total of 41,060 houses, 40,141 had the lump-sum subsidy, 721 received assistance by payment to people who paid the rates, and in 198 cases assistance was given to building societies. In the case of public utility societies, schemes had been authorised in respect of 5,681 houses. Contracts had been let for 3,601 of these, and 529 of the houses had been completed. Loans had been sanctioned to local authorities under Section 5 of the Act in 104 cases, for a total sum of £1,320,429, and under the Small Dwellings Acquisition Act in 81 cases involving £1,469,000. No proposals for the conversion of flats into small dwellings had been received by the Ministry of Health. On the general question he said he quite understood Mr. Chamberlain's anxiety about the 1923 Act. After all, it was his child, and if it had been a somewhat erring child it was loved none the less by the gentleman who brought it into existence. He had tended it with the care that one might reasonably expect from a foster father, but even all his loving attention had not been successful in making it an efficient instrument for the solution of the housing problem. The Ministry of Health, under the Act, had given authorisation to the local authorities for 40,198 houses and to private enterprise for 76,927 houses, a total of 117,125 houses. For these contracts had been let to the number of 66,698, or just about half the number for which authorisation had been granted. There were under construction at the beginning of March 23,498 houses, and there had been actually completed 6,148 houses. There was no indication of the "damping down" of the enthusiasm of local authorities by the Labour Government. He denied that Labour's housing policy was directed to the destruction of private enterprise. Labour did not propose to interfere with private enterprise either in the building of houses or in the manufacturing of building material. Labour only touched private enterprise at one point, and that was in the investment of private capital in the ownership of these rented houses. The Labour Party's housing programme was not a Socialist programme at all. He wished it were. "I wish," he exclaimed, "this country were ready to receive a Socialist programme, and we would show you how much easier it is to solve the housing problem along those lines than in trying to patch up the capitalist system, of which you yourselves have made such a mess!" There was a shortage of men and material, due to the continued instability of the building industry. That was the root cause of the shortage of houses. He hoped that within a week or two he would get from the building industry itself a plan by which—if the House was prepared to confirm the suggestions which he would put before them—the housing problem in this country would be solved within a comparatively short period. He added that he should be delighted when the workers of the country were in a position to own their own houses.

ry Park Estate, Ltd. (195,352). 1 January 28. 49, Deansgate, Man- Nominal capital, £11,000.

V. J. Saunders, Ltd. (195,462). February 1. The Poltimore Brick hoe, Devon. Brick and tile manu- manufacturers and dealers in building Nominal capital, £24,000.

THE SCOTTISH BUILDER

Forres.—Houses.—Tenders for the erection of houses under the Edward housing scheme were considered by the T.C.

Greenock.—Houses.—The Corporation submitted tenders recently to the B.H. for the erection of 150 houses, to be erected on the Cowdenknowes site. The estimated cost is £66,656.

Yoker.—Houses.—Application was made to the Renfrewshire C.C. to borrow £24,500 for the erection of the 60 houses at Yoker-road.

Renfrew.—Housing.—The H.C. of the T.C. has been instructed to prepare a new housing scheme.

Edinburgh.—Crematorium.—The Corporation Housing and Town Planning Committee considered a motion to utilise the Calton Prison for houses, and it was remitted to the medical officer of health and the burgh engineer to prepare reports. The T.C. is considering a proposal to provide a municipal crematorium. The Dean of Guild Court has passed the following plans:—Bungalows at Alnwickhill-road, Liberton, and Saughtonhall-drive; two villas at Luggon-road; two villas at Lanark-road, Kingsknowe.

North Berwick.—Hall.—The T.C. is proposing to erect a public hall for the burgh, and plans are being prepared for a building to cost not more than £10,000.

Giffnock.—Various.—The Upper District of Renfrewshire Buildings Committee has passed the following plans:—Villa at Langtree-avenue, Giffnock South, for the Glasgow & South Suburban Building Co.; power station at Clarkston, for Clyde Valley Electric Power Co., Ltd., 53, Bothwell-street, Glasgow; villa at King's-road, Auchenlodgment, for James Y. Keanie, Ltd.; cottage at Cochrane Mill, for Mrs. Kirk, Milliken Park; bungalow at Otterbourn-drive, Giffnock; four houses, joiner's shop and offices, and two shops at Kilmarnock-road, Giffnock, for McFarlane & Co., builders, Giffnock; double bungalow, at Tremaine-avenue, Giffnock South, for J. Gibson & Co., Glasgow; and church at Berryknowe-road, Cardonald, for the trustees of the Cardonald U.F. Church.

Dalkeith.—Cottage.—Plans have been passed for a double cottage on Bonnyrigg-road, for Mr. G. Swan Rollo, 2, Lothian-road, Eskbank, Dalkeith.

No Date.—**Fraserburgh.**—Additions.—Additions and repairs to Old Free Church in School-street, Fraserburgh. Mr. J. T. Munro, architect, 62, Academy-street, Inverness.

Theatre Royal, Glasgow.

At the annual meeting of the shareholders it was proposed that several thousand pounds should be spent on structural improvements at the Theatre Royal, Glasgow. It was stated that although a magnificent theatre—one of the finest interiors that could be found anywhere, with perfect acoustics—on the outside it was a hideous excrescence on the street, which necessitated extensive improvements.

International Town-Planning Conference in Holland.

An International Town-Planning Conference is to be held at Amsterdam, from July 2 to 9, 1924. The Conference is being organised by the Federation and the Dutch Housing and Town-Planning Institute, and will be presided over by Mr. Ebenezer Howard. The principal subjects for discussion will be: (*a*) Regional Planning in Relation to Large Cities; and (*b*) Parks, Park Systems and Recreation. There will be a specially selected International Exhibition of plans, pictures and drawings, dealing with the subjects discussed at the Conference. Further particulars may be obtained from the Organising Secretary of the International Garden Cities and Town-Planning Federation, 3 Gray's Inn-place, W.C. 1.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Labourers.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXVI.—No. 4236. APRIL 11, 1924.

INDUSTRIAL EXHIBITIONS

CYNICISM is not fashionable nowadays either as a philosophy or as a form of humour. Samuel Butler was the last of the cynics; he smiled at our modern discoveries as much as at our old pretences. We have no intention of appearing to be cynical n we say that the recurrent trades' exhibition has developed a function which the British public has come to expect matter of course. The modern world has committed itself he belief in a continuous improvement, and it looks to the ibition for the latest ideas. The exhibition is a manifestation l a very natural one) of an industrial age which demands licity, and if we care to regard it as a form of advertising, infinitely more desirable in this form than on hoardings in fields. That there is an educational value in an exhibition be admitted, although it would be idle to pretend t we are consumed by a passion for knowledge to make h a venture a necessity. The problem for the interested ividual is to know when the world can advise him better n he can himself. As a generalisation, there is much to be l for the statement that when we are young we do not believe ugh in the wisdom of the ages, and when we are old we believe much in it. At both stages we may fail to discriminate. It is often suggested that these frequent exhibitions are a vy liability upon the manufacturer, and consequently affect prices of his goods. Upon this purely materialistic point of w we have the assurance that an impetus is given to trade, that orders are received which would not reach the manuturer without the publicity obtained by an exhibition. can understand that this would apply to many phases of building industry, though we bear in mind that the comted structure or building is not exhibited for sale in comition with another building of a different type, as is the e, say, with motor cars. The whole complicated process of lding involves many industries which are not an end in mselves; they are involved in the art of building, and the mate object is the finished building. It would seem, therefore, that to a certain extent a building trade exhibition is an ernal affair, though the main object is to stimulate the blic to appreciate and to build.

There are new processes, new materials, new forms of conuction, and complete devices which must receive the attention the architect at some time or other. Brunelleschi, we know, rcised his mind upon the scaffolding and centering of his ous dome in Florence, and his design was influenced ordingly. Many of the newer forms of construction are gned to meet the problems set by architects, and evidence rchitectural thought is to be seen in a number of modern liances and requirements—lift cages, fireproof doors and ens, radiator grilles, electric light and shop fittings are only w which come to mind. Improvements in machinery have ught their own problems for the architect, and, for a time, ity in manufacture may easily outrun the skill of the gner. The simple design with simple tools is a simple problem, t is not necessarily opposed to simple design with complicated s. If we use our machinery properly more people can enjoy beauty of design.

In recent years a great field has been opened for the development of new ideas in labour-saving appliances in the home. Various post-war factors have contributed to focus attention upon the domestic problem, and it is evident to the casual observer that there has been a tendency to concentrate upon certain details to the exclusion of others equally important. Every architect has experience of the client who is obsessed with some particular patent or material, which he has seen or heard of, but about which he is not capable of judging. Herein lies the danger; the appeal from the manufacturer to the public must pass the tests of the architect, and it is essential that he should be informed on these matters if he means to convince and satisfy his clients. It is only beginning to be realised that little titbits from newspapers upon labour-saving in the home are merely expressions of a fashionable craze, and that the blackening of a couple of bath taps and the door-knocker will not simplify life so very much, if we are not in the mind to part with our old brass candlesticks and bed-warmer. The problem is a big one, and some sense of proportion must be observed; the idea must be carried out in every detail of furnishing throughout the house. Much of the criticism of labour-saving experts deals with trivial constructional details, and seldom with furnishing and dirt-provoking household gods.

Despite the shibboleths of the woman housing reformer, and apart from problems of economics and theories of population, it can safely be said that the standard of fitness in quality and design in house building and equipment is on as high a level of excellence as that of any other industry. There are many factors which prevent us having everything we want, but their discussion is outside the scope of this article. Everybody should be interested in the constant developments which are taking place in building appliances and materials, and should be stimulated to take an interest in the art of home building. There is a great shortage of houses in the country, and the real significance and value of a building trades' exhibition is that the public may be encouraged to take a greater interest in one of our oldest crafts and to accept its share of one of the fundamental responsibilities of mankind.

From this point of view we would like to see an exhibition of architectural design forming a necessary adjunct of every building trades exhibition. We have heard a good deal lately of the ideal triple alliance between the architect, the builder, and the client, and surely the building trades' exhibition provides an excellent opportunity to further this ideal. The importance of the manufacturer of building materials and commodities suggests to us that a quadruple alliance would represent a truer combination of factors. An exhibition has an educational value to everyone engaged in the art of building; it has an educational value to the public which cannot be computed in terms of immediate sales. In expressing the hope that every building trades' exhibition will result in a closer collaboration between all parties interested in building, we believe that we are expressing views which embody the ideal we are all striving for, and that we are stating causes of which architecture is the result. On the lines we have indicated we hope every success will attend this exhibition.

NOTES.

The R.I.B.A. Prizes.

How far the strike epidemic has affected the would-be competitors for the Institute prizes we cannot say, but their attractiveness certainly seems on the wane. The ambitions and activities of our students may find worthier objects, or they may be in lazier mood, but the elimination of the competitive spirit would surely be against the popular sentiment, and it is hardly likely to come about yet. The Board have wisely made certain revisions as to the conditions and amounts of the awards, and we shall see during the next two years if the results of effort and expenditure are justified. We hope the quality of design in a practical and artistic sense will be tested by subjects of a simpler kind, and lead to less necessity for large and costly drawings. Students should be encouraged to develop a sense of good proportion and simple distinctive expression. Great sheets of elaborately finished drawings lead to nowhere of great account. It was only the other day we had recounted to us the doings of two architects who collaborated on the competitive designs for a big building some years ago. The first design did not fully please them, though it was very carefully and beautifully set forth. The second one was hurriedly executed, drawn in charcoal, and coloured with the coffee they were using. The second one won the first place in the competition. It furnished no excuse for slovenly drawing, but it showed of how small account drawing was compared with design.

Problems for Students.

MR. PURCHON has made a happy experiment at Cardiff in setting his students the problem of designing a new City Hall. We shall look to Cardiff, with its fine record of modern public buildings, to secure a really fine public hall, and some of our best students are quite capable of giving us valuable hints. As will be seen from this issue, a well-known firm of Cardiff architects have just won an important competition at Bristol, and may not this be a note of encouragement to Cardiff students ?

The Gothic Influence.

THE very interesting paper by Mr. Goodhart-Rendel on English Gothic Architecture should help our architects to a better realisation of the value of their national heritage. If it acco plishes this it will, we believe, be well our art. We may surely hope that broad and enlightened way of envisag our nineteenth-century architecture wh Mr. Goodhart-Rendel has adopted encourage the growth of a like visi amongst our architects. Instead of findi in our nineteenth-century work attempted revival of a dead corp there may be found many who will, Mr. Goodhart-Rendel, "refuse to rega Gothic as ever having died in Englan Surely we cannot follow him in record of names which have given hon to modern work in this country witho realising that a great tradition heritage has survived ?

Waterloo Bridge.

So we are somewhat su denly confronted with rebuilding of Waterl Bridge, which has been approved by County Council, the actual design for rebuilding and widening being not settled. The question of another n bridge at the eastern end of Aldwych in abeyance. Meantime this importa work is considered urgent, whilst the important matter of cross-river traf and the replanning of the southern side the river is in the air. So we go on London !

St. Paul's Bridge.

THE remarks of members the House of Commo called together a few da since by Sir Wm. Bull to consider question of St. Paul's Bridge, seem to ha been practically unanimous in gener agreement with the arguments advanc against the bridge. A resolution carried to the effect that the meeti urgently recommended that before matter went any farther the Minister Transport would give an assurance th no money should be spent on the sche until Parliament had an opportunity discuss it.

The "Steel Frame Act."

MR. EWART S. ANDRE makes some interesting co ments on the "Steel Fra Act" in the course of article entitled "Ten Years of Constr tion," which he contributes to this is (see p. 593). He points out that those were responsible for this Act were nat ally somewhat nervous, with the re that in many respects its provisions unduly stringent and result in unnecess increase in cost. He states that it often cheaper to erect a building desig with the thickness of walls specified un the old Acts for an ordinary brick bu ing, all the internal portion of the build being designed upon a steel frame, t to erect a building designed as a s frame building under the Act. We ag with him that this ought clearly to understood by architects and otl "because when once the building in try realises this fully we are convi that sufficient agitation will arise to f

Scheme for the Development of the Exchange Site, Nottingham.
MR. T. C. HOWITT, Architect; MR. T. WALLIS GORDON, City Engineer. (*See p.* 579.)

Norwich Cathedral.
From a photograph by Mrs. M. E. B. Cox.

authorities to take steps to alter the " The matter is of such importance we invite discussion on the subject.

Bush House.

We need hardly be surprised that Mr. Ralph Knott should question the statet of Mr. J. C. Squire that Bush se is a rebuke to most public buildings. remember we were promised that in House we should find some echo of qualities of Somerset House, but a parison of the two buildings must e most English architects wondering such a promise was held out. There mething to learn from Bush House, if we cannot place it in the same as Somerset House.

---

itects nd mates.

A tale of peculiar hardship was related the other day in reference to an architect's claim for commission an abandoned building enterprise, cost of the work turning out much er than was anticipated. The archisent in an account and was offered than a third of what he had charged. therefore brought an action for the unt claimed and he was not only suited by the judge, but not even ed the amount his clients had tenl him and was saddled with the y costs. It therefore behoves architto protect themselves beforehand liability for the surprise of estimates.

---

ctorship esearch lding terials rd, &c.

Dr. R. E. Stradling, M.C., M.Sc., Ph.D., Assoc.M.Inst. C.E., A.M.Am.Soc.C.E., Head of the Department of Civil Engineering, Architecnd Building in the Technical College, ord, has been appointed Director esearch of the Building Materials onstruction Research Board of the nment Department of Scientific and trial Research, London. The Buildesearch Board, according to the Report of the Research Department, was formed in 1920 to consider and direct the conduct of research on building materials and methods of construction. For this purpose a research station at Acton was established in July, 1921, and since that time this station has been in full operation. Having regard to the immediate importance of the housing question, the efforts of the Board at first were directed to research into building materials and methods of construction suitable for small houses. But the Board has considered that its most useful function lay in fundamental research, and with this end in view the work has fallen naturally into two categories: (*a*) fundamental research of an almost purely scientific nature, and (*b*) the attack of practical problems where economic situations enter or are even paramount. Dr. Stradling was appointed as a member of the staff of the Technical College, Bradford, in August, 1922. Since he has entered upon his office in that College he has been responsible for the direction of the whole of the work of the Department of Civil Engineering, Architecture and Building. He has remodelled almost entirely the full-time and part-time courses in the College.

Our Polluted Atmosphere.

Smoke, fog, foul air and vibration are leaving their mark on Southwark Cathedral. The appeal of the Cathedral authorities for help should meet with a ready response, but the need for preventative measures against the source of this damage is an even more urgent affair.

Triumph in the Back Yard.

The new insurance building by the entrance to the Admiralty Arch in Trafalgar-square, now nearing completion, merely underlines the perpetuation of yet another ragged edge to the various efforts we make in the direction of civic planning—efforts which so often give way to exhaustion. Our great ceremonial highway, aiming proudly and axially at our conception of a triumphal arch, is now condemned for at least another generation to debouch on to a back-yard. No wonder the spirited State horses shy and side-step at the sight, and seek an outlet by way of the Horse Guards'-parade! And how the foreigner must laugh! For ourselves, we would weep with humility and shame and hope on for the long-desired plan that will make these things impossible in the future.

Salmon Fly Posters.

If hypocrisy is the homage vice pays to virtue, the improved poster is the compliment trade pays the artist. Chairmen of great companies have been telling their shareholders that far from being high-brow or æsthetic, they encourage the poster artist because it is worth while. Good work makes good. Every advance in taste is a milestone gained; we must consolidate the ground by avoiding either a stereotyped manner or a reaction to the shock tactics from which we have just escaped. Fishermen tell us there are two principles of appeal in the fly-makers' resources, that of natural attraction in the trout fly, and that of the daringly provocative in the salmon allure. At present it is the hour of the Jock Scot, and very good it is. Our advice to the trader is to give the artist his head, and if he is an artist to leave him alone. It may appear captious to criticise, but in this art to have attracted notice is the measure of success.

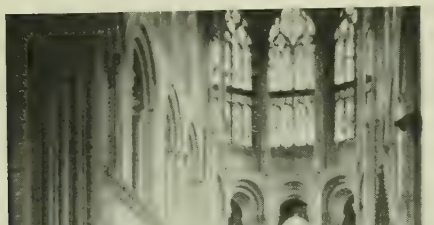
Village Life.

A Leaflet issued by the Rural Industries Intelligence Bureau sets out in general terms the nature of the problem of village life, and there is a good deal which we can cordially endorse in the views expressed. "No one," as it is said, "who compares village life as it was and as it is, can fail to be struck by the former diversity of its interests as contrasted with the present monotony." It is when we come to the consideration of the remedy for all this that the difficulties appear. The village has decayed with the decay of human relationships, and needs more than economic laws and organisation to restore it. There are some hard sayings in this leaflet for those who regard the problem not as, first of all, one of either economic or administrative character, but as in the main connected with deeper and more vital considerations.

From the Interior of Norwich Cathedral.
From a photograph by Mrs. M. E. B. Cox.

GENERAL NEWS

Professional Announcements.



The practice of Messrs. Charles Jackson & Son, chartered quantity surveyors, is now transferred to 75, Princess-street, Manchester.

Mr. Philip Robson, of Westminster and Manchester, has been appointed Consulting Architect to the Wigan Schools' Association.

The address of Messrs. Collcutt & Hamp is now 126, Wigmore-street, Portman-square, W.1. Telephones: Mayfair 4764–5.

Housing at Wembley.

Among their exhibits at the British Empire Exhibition the Ministry of Health will include photographs and plans illustrating the lay-out of approved housing estates and the design of the houses. The examples have been selected from different parts of the country so as to show the difference in design according to local conditions and the materials available. Two large town planning models will be found side by side, one representing a common type of industrial town, devoid of intelligent arrangement, inconvenient, and smoke-blackened, and the other showing what can be accomplished by foresight and skilled design upon the same site. There will also be a set of the maps required for a town-planning

scheme and a perspective plan showing what Margate is expected to look like at some future date. A map is also to be shown indicating the regions in England and Wales where town-planning schemes are being carried out. The exhibit on smoke prevention will show the approximate amount of impurity in town air, and the instruments used for recording and measuring air pollution; charts will illustrate the damage and waste of fuel caused by inefficient combustion.

Carlton Club Reconstruction.

A luncheon was recently given at the Carlton Club, at which Viscount Younger of Leckie presided, to the workmen of Messrs. Trollope & Colls, Ltd., who were engaged on the work of reconstruction. There were bricklayers, masons, carpenters and painters, together with their labourers, who sat with various members of the club.

Mr. Goodman, the general foreman, was received by Viscount Younger, the Chairman of the Club.

Viscount Younger said the Committee thought the best plan to show their appreciation of the way in which the work of refacing the Club had been carried out was to entertain the men to lunch. Viscount Younger coupled with the toast the names of the two foremen, and Mr. Goodman, in response, said that they would all look back upon that day with very great pride.

Building Trade Wages.

A conference will be held in London to-day between the building operatives' trade unions and employers in regard to the operatives' demand for a wages advance of 2d. an hour. The employers' offer of ½d. an hour, with other concessions, has been rejected.

Government Housing Scheme.

A conference on housing in Greater London arranged by the Guildhouse Fellowship was held recently at the Guildhouse, Eccleston-square, on Saturday.

Dr. Raymond Unwin, chief architect to the Ministry of Health on Housing and Town Planning, said a good deal had been achieved in the direction of beauty in building by recent housing schemes. It had been established that a good house could be built with plenty of garden without costing more than many of the nightmares of ugliness and bad types erected by short-sighted people.

Mr. Coppock, general secretary of the National Federation of Building Trades Operatives, speaking of the Government's proposals, said that we were on the eve of a tremendous proposal with regard to housing in this country. The present Government had tackled the problem of housing in a manner entirely different from that of any previous administration.

On the matter of dilution, Mr. Coppock said it was impossible to train a man to any of the crafts after he had got beyond a certain age. Any augmentation must come from boys from eighteen to twenty years of age. Dilution over that age was uneconomical. But in return for training these they demanded a guarantee of employment for some years, and he thought he could say that the guarantee would be fulfilled for a period of at least fifteen years, provided the Opposition in Parliament agreed.

The programme they had set out, he continued, was 2,500,000 houses in a period of fifteen years, which was 500,000 less than they anticipated being able to do. The people tackling it were going the right way about it. Industry was prepared to use every effort to do this work.

Mr. Coppock, speaking on the type of houses that should be built, said that despite all that had been remarked about the Addison house being small and not having a good aspect, it was the best house that had been built for the working classes in this country. But the ones they were going to build would be better, there would be more concern shown for the equipment of the house than for beauty of aspect. Let them spend the money on helping to save drudgery in the house rather than on beautifying the aspect.

COMPETITION NEWS

Bristol Police and Fire Premises.

The assessors, Messrs. W. Curtis Green, F.R.I.B.A., and George H. Oatley, F.R.I.B.A., have made the following awards in this competition:—

(1) Messrs. Jones & Thomas, Cardiff.
(2) Messrs. Ashley & Newman, London.
(3) Mr. E. Vincent Harris, London.
(4) Mr. Harold E. Todd, Bristol, and Messrs. Smith & Hendy, London.

The assessors' report is given on p. 575, and the designs placed first and second are illustrated in this issue.

Fryston Hall.

The South Yorkshire Poor Law Committee recently assessed designs in connection with the scheme for the conversion of Fryston Hall into a mental institution as follows:—(1) £100, Mr. J. Ainley, Huddersfield; (2) £50, Messrs. Percy Brown & Glover, Newcastle-on-Tyne; (3) £25, Messrs. Walter Hanstock & Sons, Batley.

New Premises, Hull.

The assessor, Mr. L. Kitchen, F.R.I.B. has placed the design of Messrs. F. G. Hort H. Andrew, AA.R.I.B.A., first in a limi competition for new premises to be erected the Spring Bank, Hull.

Public Hall, Glasgow.

Designs are invited for a public hall to approximately £25,000. Premiums of £ £100, £75, and £50 are offered respectiv A plan of the site, together with terms conditions can be obtained from the Offic Public Works, City Chambers, 64, Cochr street. Sending-in day, July 4.

Other Competitions.

Other competitions still open include following (the dates given are, first the send in date, and second the issue of *The Builde* which full particulars were given):—Indus Designs (June; Dec. 21, 1923). Nati Theatre (April 26). Ross-Smith Mem (Sept. 30; Feb. 1). Bradford Masonic Te (June 30; March 28). Salford Baths (April April 4).

A FINE OLD CITY

AN APPRECIATION OF NORWICH

By GEORGE KENWORTHY, Assoc.M.Inst.C.E.

...ERE is always something elusive and ...ctive about a place which boasts a nur... rhyme. The real old English nursery ...e dates back to the times before our ...en language as we now know it, when ...ers crooned these little songs to their ...ren in just the same words as they them... ...s had heard them. A city with a nursery ...e bears the hall mark of Father Time. ...yone has heard of the Man in the Moon, ...his search for Norwich.

...en as a child this appealed to me: I ...ed to follow this Dream-Man in his ...h. Now that I am a citizen of this Old ...d city I find that Norwich does not dis... ...nt—it lives up to its reputation. Truly, ...orrow says, "It is a fine old city—per... the most curious specimen at present ...t of the genuine old English town . . . ... can wonder that the children of that fine ...ity are proud of it?"

. . . . . .

... it not contrast which makes life really ...esting? And Norwich is essentially a ...f contrasts. On the one hand, a large ...ltural centre, on the other a ...ng industrial town; the "Charing ..." of the Broads, and the most ...ssible town in England; a city ...ng one of the most inspiring ...d edifices in the kingdom, a city ... flintwork and architecture of ...ost rare abounds; yet a place of ...w winding streets and crazy ...e-down houses; a city in one of ...attest of counties, yet built on ... surrounded by considerable ...s; a city built in a district of ... and marsh-lands, where is ...ed almost the lowest annual ...ll of any place in England!

...wich forms as great a contrast ...en the grey-black industrial ...s of the North as that which ... between the fresh optimism of ...ild and the grave outlook of ...dult. Therein lies its charm. ...after all, those who live out ... lives in the great, bleak ...cities, who are only in... ...ed in—can only talk of— ... and coal, manufacture and labour, miss a good deal of the charm and beauty of life.

One can be efficient, work hard and well at engineering or manufacturing, wonderful and engrossing as these occupations are, and yet know that they are overshadowed by a still greater and more ancient industry—that of agriculture. But Norwich is a manufacturing centre too, and is famed, not only for mustard, but for many branches of engineering, and perhaps most for the manufacture of "my lady's" dainty shoe. Thus Norwich, having wedded the two, may be congratulated on the success and happiness of the combination.

Have you, perchance, seen the "black" country of Staffordshire where, for miles around, neither trees nor grass will grow? Then appreciate the unspoiled natural beauty which lies within and around Norwich.

Have you lived in the big, grey cities where all is rush and noise, where streets are wide and straight, with houses well-built, and yet, withal, of a sameness and an ugliness past description? Then appreciate this picturesque old English city.

Studies of Norwich Cathedral.

[The views of Norwich Cathedral on this and the preceding page are from photographs by Mrs. M. E. B. Cox.]

Consider the wondrous Cathedral, of a grace and delicacy unique in this country. Where is the fraternity of early masons who so tirelessly built, with such unerring skill, a structure whose beauty appeals with poetic power to all that is best in us, stamped and imprinted, as it is, by those builders, with the evidence of their devotion to the Great Architect? In spite of its hoary age, its baptisms of fire, this fine Cathedral might have been built but yesterday!

. . . . . .

Here we have tottering, crazy Tombland Alley, leading to the Maid's Head. As you pass along the narrow causeway, can you not see standing there outside the famous hostelry the coach of the haughty Queen Bess? Yes—and here comes her retinue, and there, the proud Queen herself!

. . . . . .

There is a simple pleasure in watching the boatmen ply their long "quants" as they urge the characteristically quaint wherries along the mirrored surface of the Wensum, past the old Boom Towers, where, giving rein to your fancy, you may conjure up visions of a long-dead past.

. . . . . .

Did not the Viking Sweyn, with his fierce Danes, sail up this very river and carry war, ravage, and fire to the city? Was not Harold, the last English king, governor of the city? and that national hero, Hereward, the last of the English—did not he and his noble band of heroes from these parts defy the proud Normans on the waterways hereabouts?

Trace the old city walls to the Boom Towers and in fancy see the fight—in fancy hear the dull, reverberating thud of the battering-ram, the twang of the cross-bow, the hum of flying arrows, and the fierce cries of the combatants amid the clash and crash of axe and sword.

What tales these crumbling walls would tell if stones could speak!

And the Castle and the Keep, dominating that mighty mound where, so tradition says, King Gurgunt, usurped and enthroned, his treasure about him, lies buried deep!

Do not these stories conjure up visions of the grandeur of the days of old? Of chivalry and gallantry, of songs and revels—aye, and of debauchery, too—recalling the names of Roger Bigod, the Norman builder of the Keep, and his son William, Constable of the Castle, who, with the Conqueror's grandson, Prince William, together sailed and sank in the ill-fated "White Ship."

. . . . . .

Nor must Kett be forgotten. Many a rebel has had a more ignoble cause! Was he not a hero? Was not the battle on Mousehold (where eventually he was routed by Warwick) after which Kett was ignominiously hanged on the city walls—an association of which Norwich need feel no shame, since it was a resistance against unjust land enclosures by the grasping Barons?

. . . . . .

Turning now to more recent times and people, it is not strange that so beautiful a city should have produced one of the few really great landscape painters, John Crome—"Old Crome." Nor is it anything but fitting that Norwich should possess the greatest honour of all—the quiet grave of the Martyred Nurse, who gave her life for her country, and who now sleeps serenely in "Life's Green," beneath the shadow of the city's great Cathedral.

. . . . . .

Yes! Indeed, Norwich may well be proud of its past and of its present. May it be granted full confidence in its future, too!

Yet, I wonder, do its citizens appreciate fully, as they should, the unique beauty of their lovely city?

CORRESPONDENCE

Attracting Public Interest.

Sir,—As a constant reader of *The Builder* I should like to express my appreciation of your article, "Attracting Public Interest," in your last issue. I am not an architect, but plan drawing (ground plans) has been part of the duties of the position I hold and, for many years past, perusal of your paper, with reproductions of architects' details, has always been of great interest, profit and pleasure. (I may also say that many of the advertisements have been instructive and of much interest.) Exhibiting architectural drawings is, in my opinion, of educational value to everybody. This educational process is very necessary from the points you adumbrate, as I have often found the ignorance of even intelligent persons quite detrimental to themselves. So much additional interest is being taken at the present time in housing schemes that it is incumbent on parties having the settlements to be well versed in at least a superficial knowledge of their commitments. The general public, too, when knowing the innumerable details, apart from the necessary expert skill obtained by years of study and experience in most cases, would more willingly pay the fees charged by architects. The architectural art is delightful and elevating, and the more publicity given to all its beauties the more I consider will society benefit in the mass.

Jas. Bolton.

Scarborough Wages.

Sir,—A question has arisen respecting the grading of Scarborough under the National (Town) Grading Scheme which superseded the Area Grading Scheme previously in operation. Under the old Area Grading Scheme, Scarborough was placed in Grade "B," and under the Town Grading Scheme automatically was regraded A 3. The present rate for tradesmen in A 3 towns is 1s. 6d., but in the *Builder* the rate for tradesmen in Scarborough is shown as 1s. 7d., which is the agreed rate for A 1 towns. Will you please let me know if any change has recently been made in the grading of Scarborough and/or other towns in Yorkshire?

L. B. Bagot, Major.

Yorks.

[Scarborough was regraded from A 3 to A 2 with effect from October 1, 1923, and from A 2 to A 1 on and from February 1, 1924.—Ed.]

The Headless Saints in Ely Cathedral.

Sir,—It seems a great pity that no attempt has been made to restore the heads to the beautiful figures in Clunch stone in the superb Lady Chapel. The beheading was the handiwork of Oliver Cromwell, so that it can hardly be reverence for him that prevents the restoration. Perhaps the Dean may take the matter up when he sees the figures that have recently been restored at St. Paul's Cathedral.

Edward Vale.

Weston-super-Mare.

ARCHITECTURAL SOCIETIES

READING SOCIETY OF ARCHITECTS.

The fourth annual meeting of the Reading Society of Architects, which is the Berkshire Branch of the Berks, Bucks and Oxon Architectural Association, was held recently at Reading.

The chair was taken by Mr. W. Galt Millar. The hon. secretary (Mr. C. B. Willcocks) read the annual report dealing with the work of the executive during the past year, in which it was stated that the total strength of the Society now is 102 members, made up as follows:—Fellows, 11 associates, 23 students, 8 associa craftsmen, and 11 honorary members.

The following members were elected to f the executive committee for 1924:—Chairm Mr. H. Whiteman Rising, F.R.I.B.A.; v chairman, Mr. W. Galt Millar, F.S.I.; l treasurer, Mr. W. R. Morris, Lic.R.I.B. hon. librarian, Mr. H. Whiteman Ris F.R.I.B.A.; hon. secretaries, Messrs. C. Willcocks, F.R.I.B.A., and W. J. Freen A.R.I.B.A.; hon. auditors, Messrs. A. S. M.S.A., and E. P. Morgan, Lic.R.I.B members, Messrs. W. R. Howell, F.R.I.B J. T. Saunders, F.R.I.B.A., H. Hutt, F.R.I.B and F. G. Sainsbury, M.S.A.

The following were elected to serve as re sentatives of the Society on the Council of Berks, Bucks and Oxon Architectural Asso tion:—Messrs. W. R. Howell, F.R.I.B.A., F Floyd, F.R.I.B.A., J. G. T. West, M.S.A., C Willcocks, F.R.I.B.A., F. A. Woods, A.R.I.B J. R. Greenaway, F.S.I., and E. P. Morgan, R.I.B.A. Mr. H. W. Rising was nominated election as vice-president of the Berks, B and Oxon Architectural Association.

LEICESTER SOCIETY OF ARCHITECT

The Leicester and Leicestershire Society Architects recently held their annual prize-giv Most of the drawings, especially in the case o "Travelling Studentship Prize," were in the of sketches. The first prize was won by A. L. Sharpe, for a measured drawing of Corn Exchange. Messrs. McL. Keay, E Warren, and S. Smith were each awarded sp prizes. The Nesbit Prize, which was for a of a city terminal for a motor omnibus comp was also won by Mr. A. L. Sharpe, Messrs. Townsend and S. Smith each obtaining a share in the second. The measured dra prize was won by Mr. Frank Brown.

THE LIVERPOOL ARCHITECTURAL SOCI

The annual report of the Council for official year 1923–1924 was submitted to annual general meeting recently. The pr membership of the Society consists of 56 Fe and 68 Associates, a total of 124. There also 3 Hon. Fellows, 13 Hon. Associates, 23 students. Members elected since the of the last report: Fellow, Rowland St Associates, Donald Brooke, B.Arch. A.R.I. Edgar Fryer, A.R.I.B.A., H. H. Hu A.R.I.B.A., R.C.A., R. D. Jones, A.R.I. H. C. Killender, A.R.I.B.A., P.A.S.I., J Lawson, A.R.I.B.A., A. J. Norcliffe, A.R.I. R. A. Threadgold, A.R.I.B.A.

The Honan Scholarship for 1924 was aw to Herbert Thearle. An additional pri £10 was awarded to Theo. Wills who was l second in the competition.

Garston Housing Contract.—The second final report of the Inspector of the Minis Health (Mr. Orchard) on the inquiry int Garston Housing Contract was publishe February 2. . . . The Council are oppos architectural work of the Corporation carried out by architectural staffs unde control of civil engineers, and are satisfie the results to be obtained from such an ar ment can never be satisfactory.

Liverpool Master Builders' Association. Council received a deputation of the Builders' Association who desired to sa arrangements had been made whereby would rejoin the North-Western Federat Master Builders) from May 1. The Depu explained the difficulties of the position respect to apprentices in the building and the efforts that were being made to an increase in members.

In view of the much larger amount of now required for carrying on the building the deputation asked the assistance Council with respect to the issue of i certificates, which it was desired sho issued more promptly as the money due. Where it was intended that a clause should form part of the building co it was asked that it should be so state item in the bills of quantities.

Photo, R. Huth.

[St. Bartholomew-the-Great, Smithfield: View from Apse and Altar, North Ambulatory.

BRISTOL POLICE AND FIRE STATIONS COMPETITION

In the course of their report the assessors te:—"We have carefully examined the enty-eight designs submitted in this competi-n. With notable exceptions the standard ained is disappointing. It is notable that very competitors have been punctilious in adhering the letter of your conditions, and some of se who have come nearest to doing so are thest from architectural excellence. There , however, individual designs of very great rit, the authors of which have kept, if not the er, the spirit of the conditions in such terial points as the positions and areas of cified units in the design.

We recommend that design numbered 9. arded the first premium, be carried out. s is a design of exceptional merit. Not y is it a scholarly and refined work, it has a genuine and legitimate originality based on a sound knowledge of architecture. The rations express in a remarkable degree the pose of the building, and the author should be ouraged and helped to carry out his design h only such minor alterations as may suggest mselves in the process of working the design in detail. A good feature of this design he absence of internal areas. This, and the zzanine floor, the latter necessary to give the ommodation asked for, allows of the yard ng larger than you anticipated. We are of nion that with reasonable care this design, ch in many respects is the simplest and most nomical of those submitted, can be carried within the limits of costs imposed by the ditions.

Design numbered 5 we place second in order merit; the plan very closely adheres to the rictions and conditions, the elevations are nified and restrained, the whole is a con-ntious and highly competent solution of the blem, very economically arranged.

We have awarded the third premium to gn numbered 21. This in some respects is most ambitious architectural composition ny, with many good qualities both in plan elevation.

After these designs there is a considerable p in quality; we award the fourth premium qual parts to designs Nos. 4 and 10. They conscientious but undistinguished attempts olve a difficult architectural problem."

he assessors were Mr. Curtis Green, .A., and Mr. George H. Oatley.

he full result of the competition is given page 572.

e illustrate in this issue the design placed , by Messrs. Ivor Jones and Percy Thomas, R.I.B.A., and the design placed second, Messrs. H. V. Ashley and Winton Newman; R.I.B.A.

the course of the report submitted with r design Messrs. Ivor Jones and Percy mas state:—

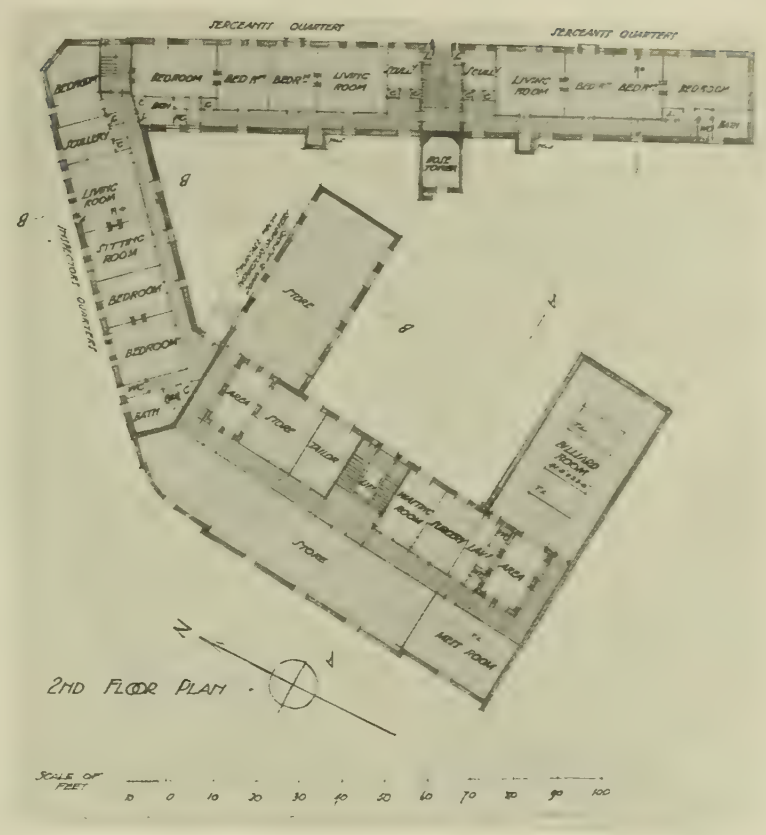
An endeavour has been made to solve problem in a bold, simple and straight-ard manner by a single building following outline of the site, and omitting entirely all nal courts or areas." They draw attention ie following features of the design:—

Fire Station.

e provision of a large open practice yard, ding ample space for fire drill and giving dant light and air to the surrounding ings; and the introduction of a mezzanine enabling the space over the workshops offices to be economically used.

e engine house is arranged so as to allow of the thirteen machines to have a clear o the street and to return to its position the yard without moving other machines.

superintendent's, inspectors' and ser-s' offices are placed centrally, and command hole of the engine house, while the watch is on a mezzanine over these offices.



billiard room, reading room, mess room and baths are on a mezzanine floor over the workshops, easily approached from the engine room; the billiard room actually overlooking the engine room.

The hose tower is combined with a practice tower, and placed against the north wall of the police courts, thereby allowing ample facilities for hose and ladder practice. A covered washing space is provided adjoining the tower. Returning machines would proceed direct to this for washing, hoses would be removed for drying, and tanks filled from adjoining petrol filler, and machines would then proceed direct to their stations.

The whole of the married quarters have been provided on two floors. Separate coal houses are provided in the basement. Each of the quarters has a separate entrance from a wide open verandah overlooking the practice yard, and a laundry is provided on the first and second floors with access to the flat roof for drying purposes. Four sliding poles are provided, two opposite the entrance to the sergeants' quarters, on first and second floors, one from inspectors' on second floor, and one from the superintendent's house. All poles land direct into the engine house, and one is available for the occupants of the billiard room.

Advantage has been taken of the necessary large headroom of the engine house to introduce a mezzanine floor in the administrative block adjoining, thus eliminating any projecting wings in the practice yard. Staircase, lift and lavatories are conveniently placed to serve all floors. The first floor extends over the Rupert-street portion of the engine house and provides a large well lighted administrative office, board room, &c., with centrally placed staircase, lift and lavatory block.

The second floor contains billiard room, surgery, classroom, &c., and two store rooms, the third store room being on the mezzanine floor.

Second Floor Plan.

Bristol Police and Fire Stations Competition.

Design placed Second: By Messrs. H. V. Ashley and Winton Newman, FF.R.I.B.A.

Stables.

The stables and hackney carriage department are placed at the corner of Nelson and Silver streets.

"A" Division.

This department has been arranged on similar lines to the plans prepared by the City Valuer, but with the small areas at the back eliminated, and the walls of the parade room carried down, enabling the whole of the cells to be placed facing the internal area at the rear. A wide, easy staircase leads from the charge room to the cells, and the cell corridor communicates direct with the corridor under the police courts. Staircases at either end of the building lead to a large parade room on the first floor, and a mess room over the skittle alley.

It is proposed to construct the building generally of brick faced externally with bath-stone from an approved quarry, the whole of the floors, staircases, &c., being of reinforced concrete. The foundations would be carried on a reinforced raft or piles, depending on the nature of the sub-soil, to ascertain which trial holes will be sunk. A sum of money is set apart to cover any special foundations which may be required.

Each of the three departments, Fire Brigade, "A" and "E" Divisions, would have a separate low pressure hot water heating apparatus, with radiators fixed against the outside walls, and provided with fresh air inlets where possible. The administrative and police offices would also have the vitiated air extracted at ceiling level, and conveyed by ducts to electrically driven centrifugal fans placed on the flat roof. All married quarters would have fireplaces in the principal living rooms.

The total estimated cost of the Fire Station is £45,749, and for "A" and "E" Divisions £64,761, making a grand total of £110,510.

THE WORK OF ALEXANDER THOMSON

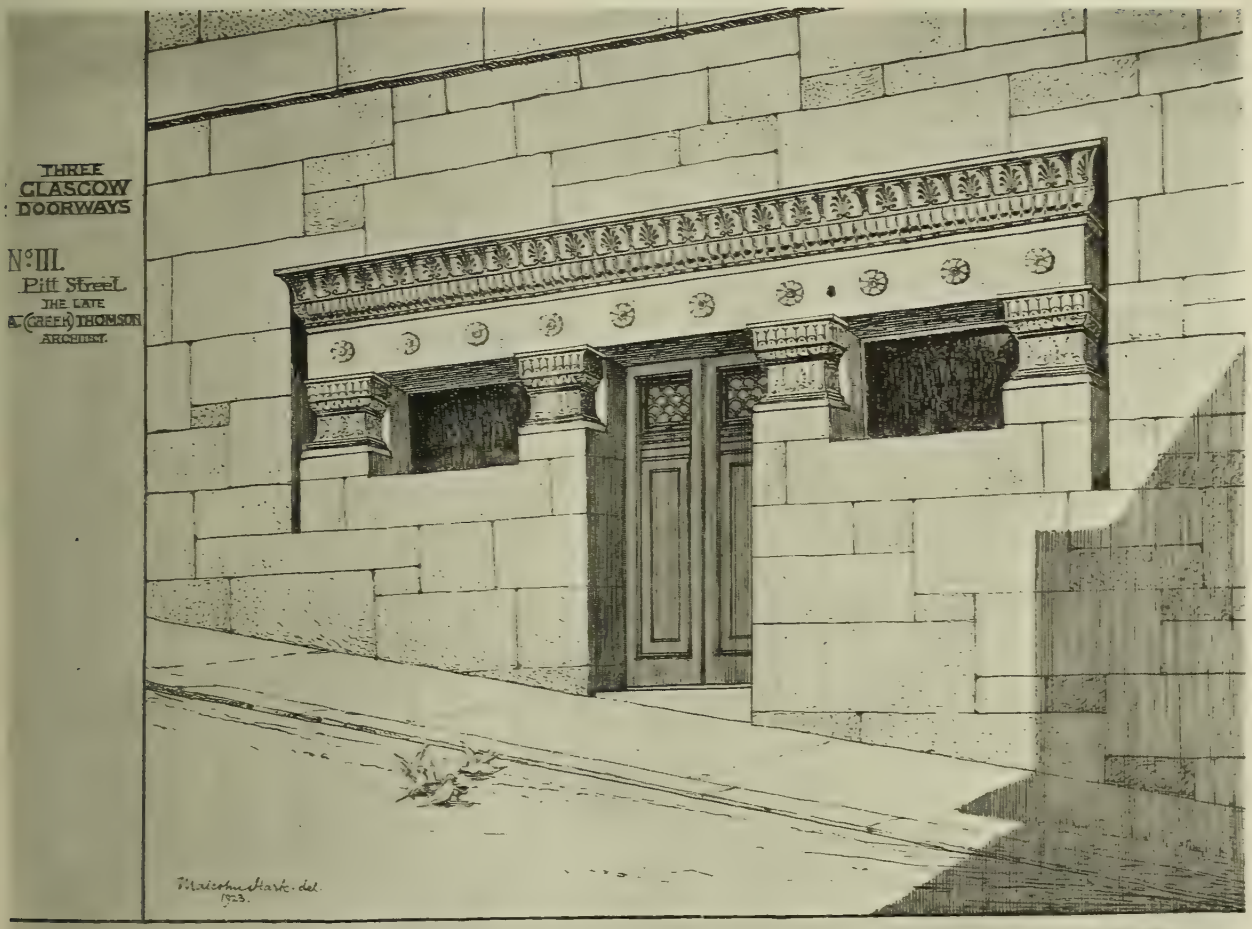
By MALCOLM STARK.

There are many architects. The inspired are few; many begin and continue to do well, until commercial considerations prevail, and ideals are too often sacrificed in favour of a lucrative practice. Some, whose works bear the mark of the master-mind, are taken from us at a comparatively early age by the unsparing hand of time. Wm. Burges, J. D. Sedding, Eden Nesfield, G. Gilbert Scott, Junr., and E. W. Godwin (who all left behind a legacy of executed work of a very high order) passed away before reaching the age of sixty. Alexander Thomson—known to the profession as "Greek Thomson"—died at the age of fifty-eight. His contemporary, George Edmond Street, passed away about the same age.

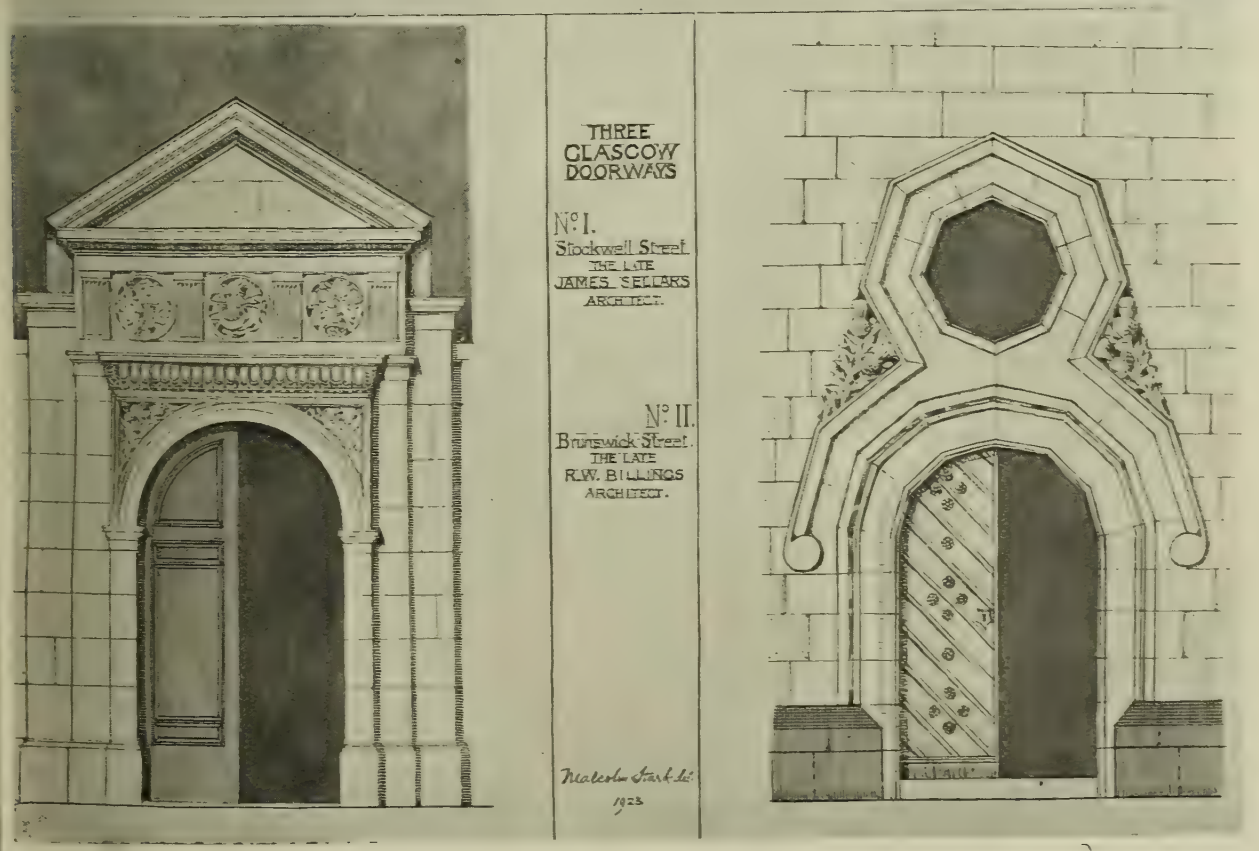
Both of these eminent architects practised with distinction in very different types of architectural art. And while both Thomson and Street respected the traditions of the particular type of art that appealed to them—Thomson of Classic, and Street of Gothic—they exhibited in their executed work a very remarkable power of individuality and variety in design. Street was not attracted to formal Gothic, English and Continental examples were to him but sources of inspiration and suggestion. And Thomson, in common with Street, regarded precedent as a servant and never as a master. It sometimes happens that the early creations of those distinguished in the higher walks of art are more inspired, and consequently more inspiring than their later works. This may be said of a church by Street in Westminster, and a small school at Chatham—they possess a charm that is stimulating and is not to be found in his later ecclesiastical buildings. Thomson's work, on the other hand, improved with experience. To those acquainted with it, they are impressed with the feeling that in some of his early work he is cautiously feeling his way. He designed for a very short period in domestic Gothic; later his work was suggestive of Italian; but when he elected to become the exponent of modern Greek, no consideration would tempt him to forsake his adherence to it—and his sagacity in this direction will find favour with sensible people; perhaps for this reason he was very fortunate in having a most appreciative clientele. He had ample opportunities of meeting and reciprocating the thought of the cultured in science, art and literature. And the personal conduct of his practice, his sacrifice of money through an honourable faithfulness to artistic ideals, and his literary ability doubtless brought him quickly into contact with sympathetic clients, and he soon built up a varied and extensive practice. To the public his conceptions were too vast and too abstract for appreciation; to the connoisseur they were a perennial source of enjoyment. Thomson died just as he finished his most original and most distinguished work—Queen's Park Presbyterian Church, Glasgow. His earliest ecclesiastical erection is St. Vincent-street Presbyterian Church—a structure which, commanding as it does a fine vista to the south, gains much in dignity by being placed on the slope of an eminence, and on a site open on three sides. It is designed with a fine open portico of the Ionic order to the north and south. Its principal feature is a large tower, slightly Egyptian in feeling, rising on the east side as a perfectly harmonious integral part. It is a noble composition, the proportions, profiles and the disposition of the subsidiary parts leaving nothing to be desired.

Very different in character is Caledonia-road Presbyterian Church. The site is a level one, and also open on three sides. The principal front is designed with an open portico of the Ionic order, resting on the ground story; a fine tower, suggestive of an Italian campanile, is placed on the west side of the portico. This work combines in a high degree severity and refinement, and is more academic in its ordered lines than any of the other four ecclesiastical buildings designed by Thomson.

The works of Thomson cover a large field of operation. His tenements, three to four stories in height, and all built of polished ashlar courses of sandstone, line many of the principal streets of south Glasgow—Eglinton-street, Moray-place, Nithsdale-road, Pollok-street, &c. All are typical of his architectural expression of Greek in every line of detail, although it is impossible to find a single repetition of design.



Thomson also erected a large number of warehouses. The largest and finest of these may be said to be the fine block on the east side of Union-street. As a design unbroken by any single feature in its great length, it is remarkable. The fenestration of each story is very fine; the flat surface of the walls is enriched with much incised Greek honeysuckle ornament. This lofty structure, with a cornice of great depth and projection, towers high above its neighbours to the north and south. Placed at regular intervals on the kerb of the pavement in front of it were lamp standards of remarkable design, very original and aggressive, and of great girth. Some time ago, practical considerations urged on the part of the City Corporation led to their removal; only one is now known to exist, where it serves as a lamp standard at the converging point of three thoroughfares at New Cross-gate, London.



Another great building is the well-known Great Western-terrace, Glasgow. The site is an ideal one, and the opportunity has not been lost of using it to the very best advantage—dignity, scholarly feeling, and refinement dominate this, the finest conception that has come from Thomson's pencil. A well-known critic has said of this work: "In so far as it is possible for any architectural work to be perfect, this superb terrace must surely be considered so. Purpose of thought is in every line of its structure. It is worked out with a single-minded consistency and power that make it a masterpiece for all time. It marks the highest level of Thomson's attainment." Another fine block of terrace houses is Westbourne-terrace, situated a short distance from Great Western-terrace. Here we have a happy blending of the palatial and the domestic—a suave severity is the octave struck. Again, the Ionic order, as at Great Western-terrace, is in evidence; fluted columns are placed at each side of the doorways, guarding pleasant porches, which at once suggest dignity combined with hospitality. These are approached by a short flight of steps which add to the completeness of a beautiful architectural composition, the detail and scale being perfect.

Consistent with a very varied practice, Thomson designed several houses and cottages, principally in Langside and Pollokshields (suburban districts of Glasgow); some of these were published in a volume entitled "Cottage, and Villa Architecture." The subjects were representative of the architecture of the Victorian Age, at a time when perhaps domestic work had its vogue—when the work of Norman Shaw and Philip Webb was at its best. It is a truism to say that the quiet, homely expression of their honest endeavours found a counterpart in Thomson's domestic work. His large houses were never pretentious, and his small ones were never mean. Holmwood, Cathcart, his largest, was built for Mr. Cooper, and is a good example of the application of Greek principles in designing a residence. The provision of light and air, comfort and convenience, have not hindered a fine æsthetic performance in modern Greek. With the Greeks it was but a step from truth to beauty, and undoubtedly Thomson followed them in this—that utility as a primary consideration should always be the basis of an artistic result. Thomson's one edifice of outstanding originality is Queen's Park Presbyterian Church. Of this Church Ford Maddox Brown thought it the finest modern Greek temple in Europe.

It was his latest work and is undoubtedly characterised by a freedom and a concession to the picturesque that is simply startling. T is a playful, yet restrained abandon abo that one could only expect from a genius. horizontal lines on the ground story, with s pilasters, lead the eye along to the corne the front elevation. It is here that one e ences a feeling of disappointment. We fi have been admiring not a building, but a fa the back and side elevations are to narrow and are destitute of feature or detail. It is obvious that such a fine and original conce demands an island site—although its adaptation to its site in plan, its adm contrast of lines, its proportions and cha detail, does much to mitigate our disa ment. It would seem to be an impossibil design a Greek façade without a portic without the Greek order. Here this is a plished. A prominent feature is made main doorway, enclosing two imposts, with the architrave, support an enriched c The upper part of the structure may be s be Egyptian or Assyrian rather than Greek sturdy truncated columns support a frie riched with pateras. Above a cone-shaped feature rises, circular in plan, from an octa surbase. This crowning feature is de with rare skill and subtlety and is finished a simple iron cross. In the interior the or and striking character of the exterior is a apparent. Its simplicity and severity are ever, greatly modified by a soft and harm colour scheme. Thomson employed a L decorator of great ability—Cottier evidently had a free hand; there is a dream of colour, of Pompeian red, peacock sage green and buff; profuse compl stencilling, bound together with dirty and sombre black lines. There is n bizarre. It is clear that the decorator ceived a scheme to produce certain calc effects by a studied use of line and colour priate to a place of worship. The nece limited scope of this article precludes the bility of offering more than a very im description of this architectural triumph. indebted to Mr. Thomson's son, Mr. Thomson, F.R.I.B.A., of Glasgow, fo following information. Alexander Th was born in Balfron, Stirlingshire, in 181 married a daughter of Michael Nicholso was a son of Peter Nicholson, a well- writer on architectural subjects, an architect of many important buildings n land. Alexander Thomson came to Glas an early age, and for a few years his George was associated with him in prac that city. At that time to the student architecture was not very accessible. T literature of any value was a very go a comprehensive work by Stuart and In modern executed work Greek was seen at its best in the scholarly work— Parish Church—and in one of the W churches, the parish church of West N a building with a well-designed porti lantern tower. Cockerell's buildings w tainly infused with the Greek spirit, es in detail. All his work in London and provinces is designed with the most conse regard for the principles of classic. T would often remark that "there are tw conceptions that I can truly say have me a source of inspiration"—St. Georg Liverpool (Elmes and Cockerell) and t School, Edinburgh (Playfair). During his and after Thomson's decease the influen work had a very marked effect on the ture of the city of Glasgow.

Referring to the perspective pen drawing which accompanies this articl be admitted that this doorway of T will always rank as a gem of design. mural surface the effect of a projected tural feature of interest is obtained b into the wall, and at its ends gaining rel short columns which support a fully-reli enriched frieze and cornice, while the r incised conventional ornament on the frieze and cornice is enhanced by p plain mason work by which the do surrounded.

Doorways in Glasgow. (*See p.* 576.)

ITALIAN TRAVEL NOTES—IV.

By THEODORE FYFE.

BOLOGNA, FERRARA, RAVENNA, RIMINI, ANCONA, AND URBINO.

In Italian travel, so many are out for the well-known and obvious places, that it is only the student who has leisure or who is determined to see lesser known but still beautiful and interesting places, who troubles to investigate between Venice and Florence, except perhaps at Bologna and Ravenna. Yet a fascinating country—the Trevisan—is open to him, immediately north of Venice, starting well east at Udine and going westwards to Castelfranco Veneto; served by a railway which takes in Pordenone, Conegliano and Treviso. This is the country of Titian, Giorgione and Cima, full of the joyous spirit of the Renaissance, and with the exquisite background of the Tyrolese Alps that is seen in the paintings of its great sons. All of these towns are picturesque and quite delightful. They are perfect in September, when the first fresh airs of autumn come down the valleys from the high hills.

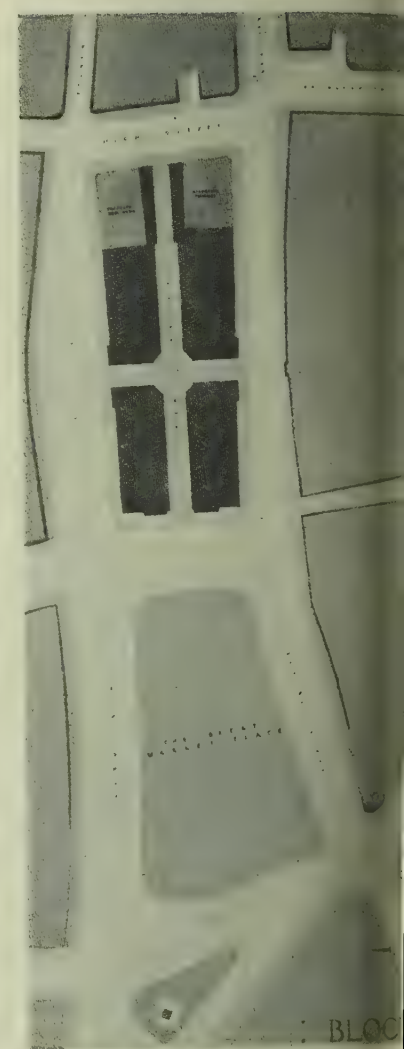
Or, again, leaving Venetia, the traveller can take a southward course from Padua to Ferrara, some fifty miles away. Another thirty miles brings him to Bologna, the capital of Emilia, and the most important station on the main line from Milan to Bari and Brindisi. Let the student, if he can, swing on to the main line, avoiding the delights of Florence for a season, and investigate some of the fascinating places between Bologna and Ancona. Before Faenza, one changes at Castel Bolognese for Ravenna. Beyond Faenza are Forli, Rimini, Pesaro (for Urbino), and Fano. To see Italy, as one ought to see it, these places should not be neglected.

Bologna and Ferrara are among the most perfect towns that even Italy possesses. Bologna gets attention from many, but one fears that Ferrara is often missed. Yet it is just as distinctive and fascinating in its way as Verona, with an old-world charm that is Ferrarese and nothing else. Here Baldassare Peruzzi built one of his most superb doorways, and one can wander about its brick palaces and its Castello for days. The town is celebrated in the history of painting. Both Titian and Corregio painted there and the native masters include Dosso Dossi, Lorenzo Costa, Cosimo Tura, and Garofalo. The Palazzi Diamanti and Schifanoia are celebrated, and the Cathedral is one of the outstanding buildings of its class in North Italy. At every turn, in Ferrara, one comes across quite unspoiled and delightful work, having for the most part, as a background, a beautiful mellow brick, sometimes relieved with terra cotta. For early Renaissance work in these materials, the town is almost unrivalled in Italy.

Bologna is larger, more sumptuous, more modern, but also with great characteristics that are entirely its own. But if Bologna is modern, it is also ancient, more ancient than Verona. Long before Rome became a power it was the capital of Northern Etruria, and its Etruscan antiquities are remarkable.* It has also old covered ways like Chester, and many leaning towers of brick. The student will find plenty of interesting and sketchable mediæval work in churches like San Domenico, San Giacomo Maggiore, and Santo Stefano; the last a mine of interest, on a site which goes back to remote antiquity.

Of San Petronio, perhaps the less said the better. It is one of those vast umbrellas that Gothic Italy attempted in a style little understood, and one is thankful it was never completed. But it has one immensely interesting feature in the large collection of drawings by Renaissance architects for the completion of the façade, deposited in the Opera del' Duomo. Here are rapidly executed sketches by Baldassare Peruzzi, alongside of more careful drawings by Palladio and others, and a really finished drawing of the lower part of the façade which was actually completed. In Renaissance work, Bologna can show a splendid piece of open-air sculpture—the bronze Neptune by Giovanni da Bologna—and one of the finest palace façades in Italy outside of Rome, the Palazzo Albergati, by Peruzzi.

Very different from Bologna is Ravenna, but if we miss the antique touch, we get a wonderful atmosphere of Italian Byzantine work. Ravenna is a place that should be avoided at certain seasons, as the miasma from the marshes near the sea is unhealthy, particularly in the autumn. It contains six great monuments of Early Christian Art—the basilican churches of San Giovanni Evangelista, Sant' Apollinare Nuova, and Sant' Apollinare in Classe; the Mausoleum of Galla Placidia; the Mausoleum of Theodoric, and the extremely fine octagonal domed church of San Vitale. To these may be added the so-called "Palace of Theodoric," a rare example of Byzantine civic architecture. All of these buildings are interesting and beautiful, though the first-named is largely a matter of modern reinstatement, and there is much incongruous Renaissance work in San Vitale. Sant' Apollinare in Classe is outside the town, but must be visited, as for atmosphere and charm it excels all the others.



At Ravenna we feel the sea is near, but at Rimini—a much healthier place—we really get to the sea. It is also a very Roman sea, as the town is the rich possessor of two remarkably fine Roman remains—the arch and the bridge of Augustus. It is peculiarly interesting also to see the arch, which is a very fine fragment, in its bearing on the really great building of Rimini. This is the Church of San Francesco, clothed by the genius of Leon Battista Alberti with a Renaissance garment, a feat which he achieved in his great Romano-Renaissance way. In the façade, a princely work, he repeated the roundels in the arch spandrels which were used by the architect of the Augustan arch. The interior is alive with most beautiful early Renaissance detail, and the whole exterior and interior treatment astonishes one with the vigour and delicacy of its handling. One need see only this Church to realise the greatness of Alberti, though his Sant' Andrea at Mantua is even greater.

Further down the coast, on this fascinating main line, we come to Pesaro, the station for Urbino, but we will go on to Ancona, as it is more in our mood after Rimini. Ancona, like Rimini, has great Roman work, the finely preserved Arch of Trajan, forming a gateway to the sea. The situation of Ancona is most delightful, and it is a much frequented bathing centre. It has a splendidly situated Cathedral, perched on a hill immediately above the town. From its western terrace the views both seaward, and inland—towards the Apennines—are superb. The Cathedral itself has a quiet mediæval interior and a noble portal of the best kind of Italian Gothic.

When the student is at Ancona, he should visit Loreto, which is near, and where the great square outside the Casa Santa has some notable cloisters and a well-placed bronze statue. Apart from this, however, the church itself is well worth a visit for the ceiling paintings by Melozzo da Forli and Luca Signorelli.

To pass from these places to Urbino offers one of the fascinating contrasts that are often met with in Italian travel. The road to Urbino is (or was) by a romantic route traversed by a diligence. One penetrates into the heart of the barrier of mountains that separate the coastal towns from the plains inland. In a great degree Urbino is remarkable for one thing, but it is a wonderful

* *See* "Etruscan Bologna," by Sir Richard Burton.

Scheme for the Development of t Exchange Site, Nottingham. (*See p.*

Mr. T. Wallis Gordon, City Engine

thing, the palace of Duke Federigo M feltro (1444-82). Through the length breadth of Italy one will wander far b another palace is found which is so compl representative of the great nobles o Italian Renaissance. Its situation is ro tic in the extreme; its materials exter a beautiful mellow red brick relieve dressings of travertine, or an even finer s internally, a rare grey stone—pietra di c —for the doorways, and the most exqui detailed and inlaid panelling and fitn The stone doors are all, in the main, of lar design, but the carving is various extremely rich and fine. Much of the intarsia work is purely decorative, w flat treatment of figures and foliage. A ticularly fine example is the large d the Sala degli Angeli, where the scheme consists of the dark brown g the old gold of the insertion, ebo greenish wood, and white—sparingly for the vertical stems of flower work. total effect of richness in this door is thing to wonder at.

The study of the Duke is a very room, high-dadoed entirely with intarsi —figure work in panels—and a secre leads from it to one of the fine recesse conies between the towers of the front which a superb view is obtained. The palace is astonishingly of a piece, ori mediæval, but blended from this ceptibly into a pure and beautiful Renaissance. As a town, Urbino has world air, and has a place of pilgrim the house of Raphael, well worth a

Bristol Fire and Police Station Competition.
We give this week the first and second prelated designs in this competition, by Messrs. or Jones and Percy Thomas FF.R.I.B.A., nd Messrs. H. V. Ashley and Winton ewman, FF.R.I.B.A., respectively. Part of e assessors' report is given on p. 575, and e full result on p. 572.

Nottingham Building Scheme.

A scheme to erect a large arcade of shops, with fices, at a cost of £410,000, on the Exchange te at Nottingham, is under consideration y the Nottingham City Council.

The site comprises an area of approximately 260 sq. yds. On the western frontage is the arket-place, an open space of about five acres; n the Smithy-row frontage the site extends to ne boundary of the land which will be occupied y the National Provincial Bank when these remises are rebuilt in connection with the idening of High-street. The site extends to the ntre of the High-street frontage, with sufficient idth to provide an extrance to the Arcade, and nall shops on each side thereof. On the heapside frontage the site extends from the uilding recently erected by the Commercial nion Assurance Company to the Market-place ontage, opposite Exchange-walk.

The widening of High-street would be conued at its new width of 60 ft. Smithy-row ould be widened, and the building line improved, nd the irregular frontage line of Cheapside also raightened, and the thoroughfare considerably nproved. On the Market-place frontage he building line would be slightly brought rward more satisfactorily to connect up the ne of Exchange-walk with that of King-street nd give a new building front at right angles to line drawn from east to west approximately rough the centre of the market-place.

The design of the intended new building is enaissance in character. The Market-place ont has been designed with a piazza, and two pen balconies have been arranged at the first-oor level on the Great Market-place front.

An important feature is the provision of two rge shopping arcades which would provide mmunication between the Market-place and igh-street, and between Smithy-row and eapside. The arcades are 60 ft. high and have effective width of 28 ft. The intersection of e two arcades is accentuated by the introaction of a glazed dome, surmounted by a wer and outer dome to add greater dignity to e building and importance to the sky-line, and the same time to give the necessary water orage accommodation for automatic fire tinguishers.

The existing buildings on the site have a pp frontage of only 390 ft., whereas the prosed scheme offers a shop frontage of approxiately three times the present amount, viz., 26 ft. A development on the lines suggested uld concentrate the administrative work for shops into the basement, and allow the llest value to be obtained from the ground or space.

A goods entrance for each shop is provided by the introduction of a wide subway under both the arcades, and from the subway an entrance to the basement of each shop would be provided. The subway would be fitted with two extra large goods elevators at the southern arcade entrance, and the use of these could be restricted to certain hours if found desirable. In addition, at the south-eastern corner of the site in Cheapside there would be an inclined road suitable for trolley traffic leading into the subway.

The whole of the ground floor would be constructed so as to allow the greatest possible scope in sub-dividing the area, varying from the small lock-up shop of say, 19 ft. by 15 ft. with a small basement, up to a large shopping store of say, 120 ft. by 50 ft., comprising five or six floors in height. Between the main piers the shop fronts would be arranged exactly as desired by the various tenants and the internal divisions for the shops would be as light as possible to conform with the usual fire insurance regulations.

The approaches to the upper floors would be grouped at the northern and southern arcade entrances in Smithy-row and Cheapside respectively. The upper floors would be finished in skeleton form only, thus enabling the accommodation to be let in tenancies varying from a small single office to a complete suite of offices, comprising three or four floors.

The building would be erected in Portland stone. The shop fronts and the upper windows would be in metal with uniform bronze letters on the shop fascias. The dome would be covered with lead. The whole of the building would be steel framed with fire-resisting floors and a subhollow floor to contain the various electric, heating, telephone, and automatic fire extinguishing services. The arcades would have a glazed roof of special construction, and the arcade paving would be arranged with ventilating and lighting panels to the basement subway.

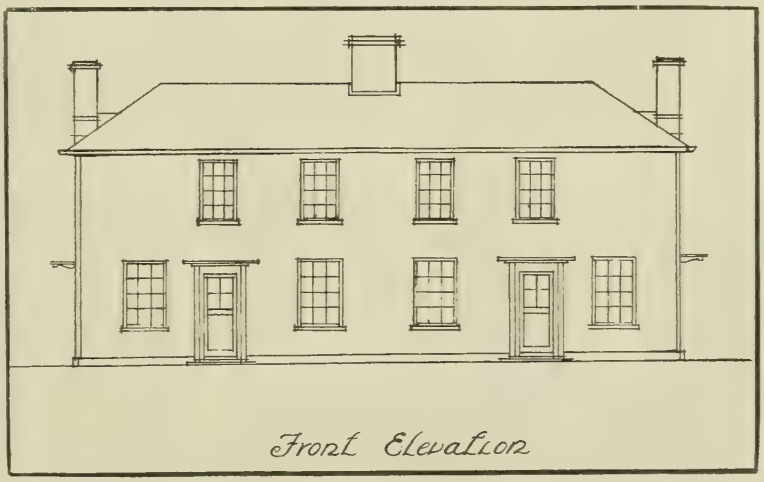
The scheme has been prepared by the City Engineer, Mr. T. Wallis Gordon; Mr. T. Cecil Howitt is the architect.

MEETINGS.

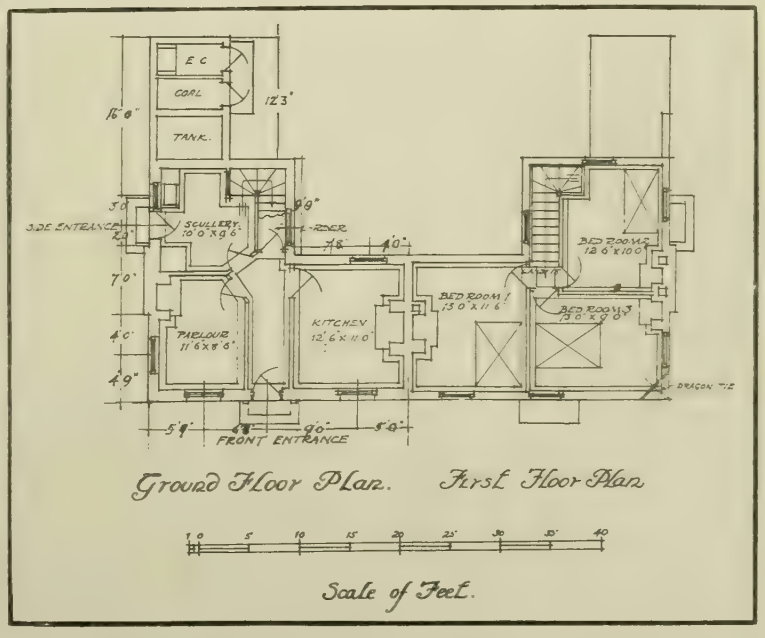
FRIDAY, *April* 11.

Royal Sanitary Institute.—Sessional Meeting. At Town Hall, Newport.

Town-Planning Institute.—Mr. F. M. Elgood on "Buildings and Building Lines, including Zoning." At 92, Victoria-street, S.W.1. 6 p.m.

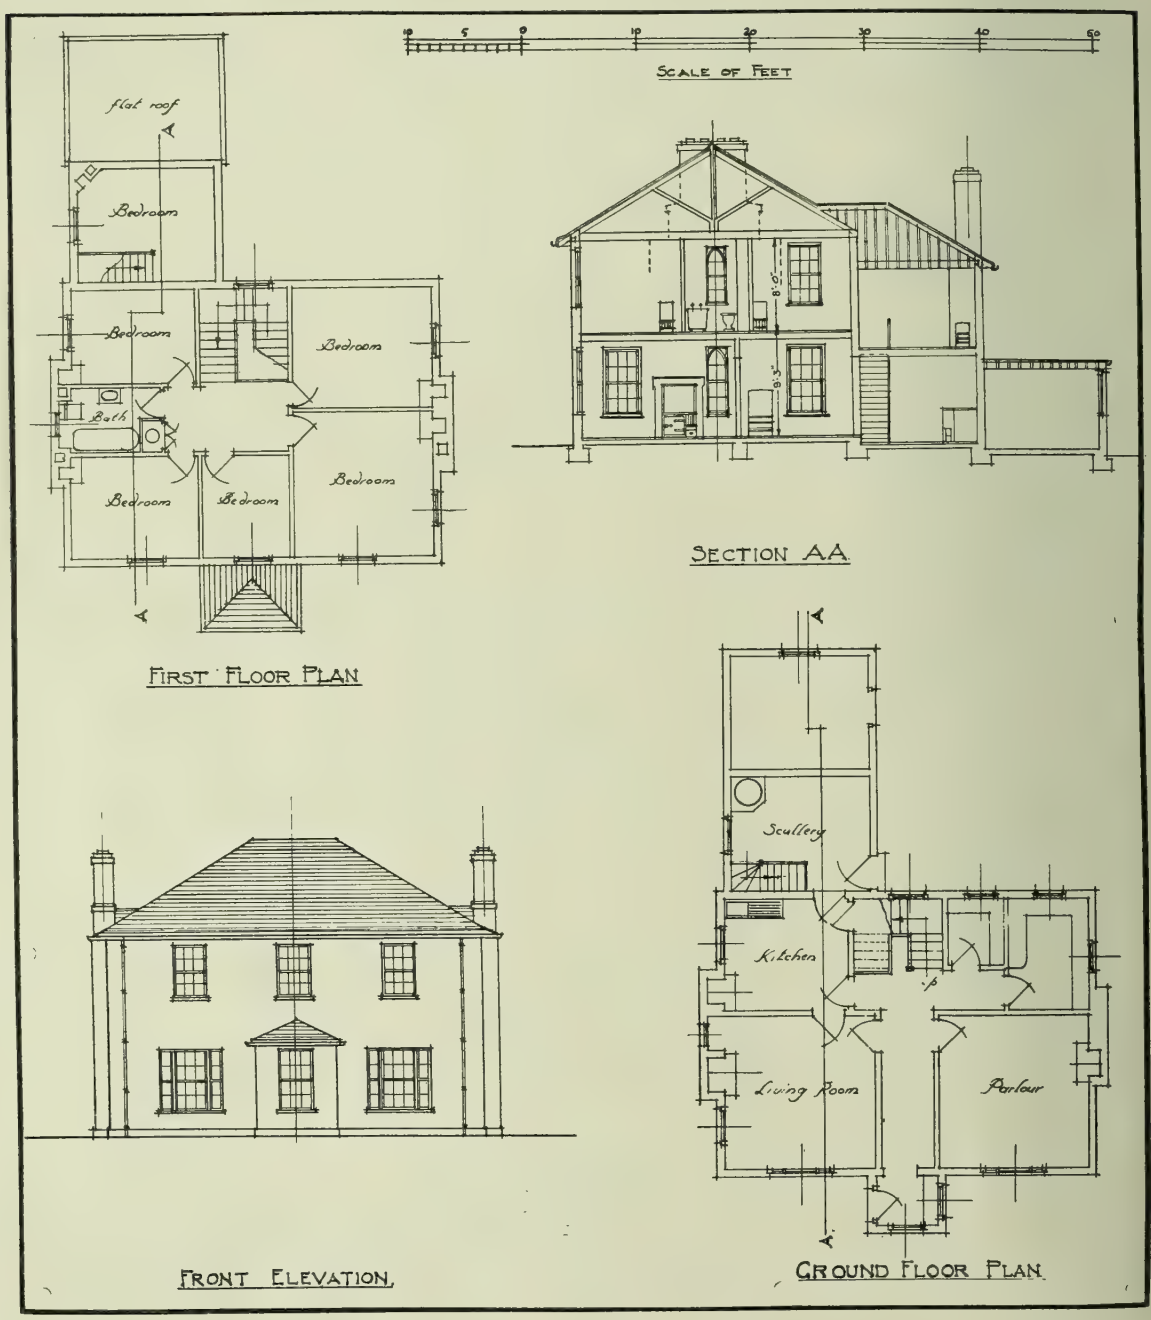


London Society.—Mr. J. Slater on "The Strand and the Adelphi." At 18, John-street, Adelphi, W.C.2. 5 p.m.



SATURDAY, *April* 12.

Edinburgh Architectural Association.—Visit to Trinity College Church and Canongate Church.



MONDAY, *April* 14.

Royal Institute of British Architects.—Mr. D. F. Slothouwer on "Modern Dutch Architecture. At 9, Conduit-street. 8 p.m.

Pair of Cottages, Holy Vale, Scilly. (*See p.* 580).
MESSRS. RICHARDSON & GILL, FF.R.I.B.A., Architects.

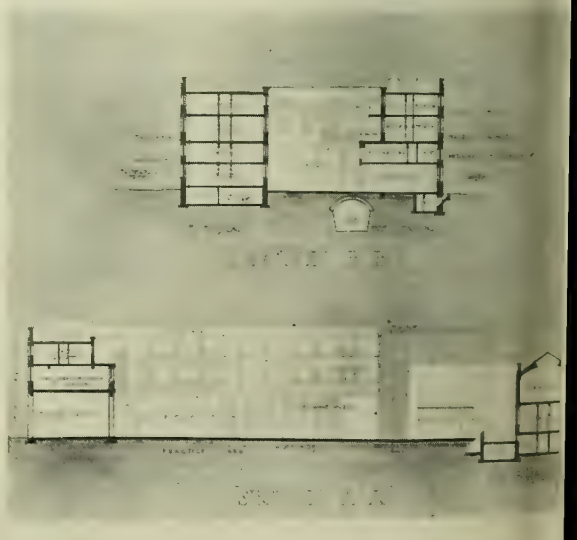
Dennis Farm, Reterth.

Messrs. Richardson & Gill, FF.R.I.B.A., Architects.

Messrs. Richardson & Gill, FF.R.I.B.A., are the architects for the work now going on for the Duchy of Cornwall. (See also pp. 584-7.)

The Parish Room, at Princeton, is to be built on economical lines. It is to have hollow brick walls and Belfast roof trusses. The accommodation is: A large hall and retiring rooms on the first floor; on the ground floor, two reading rooms, billiard room, kitchen and boiler room. The building externally is to have stucco finish.

Bungalow on the Postbridge-road.—This has been designed as a holiday house, built of local stone and roofed with Delabole slates.

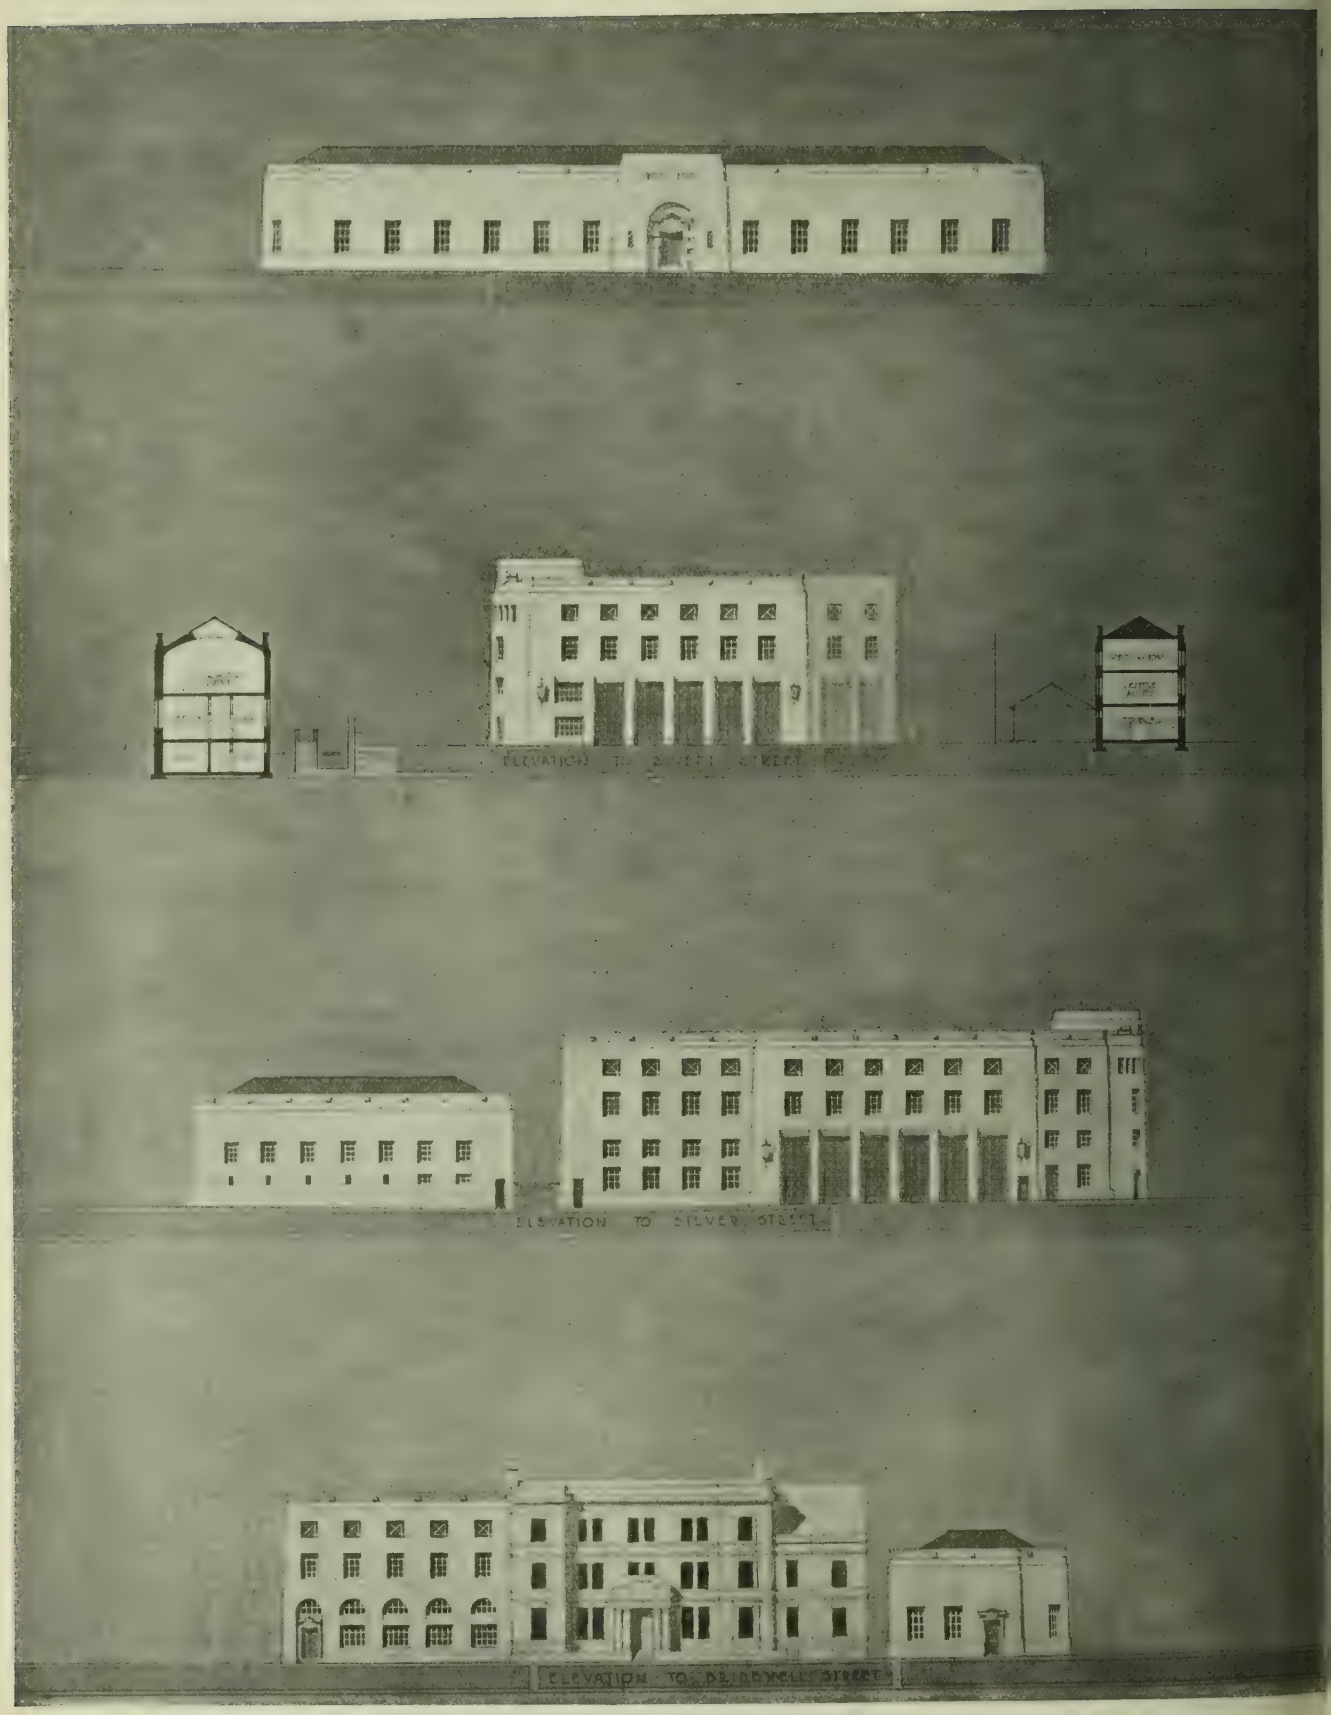


Bungalow at Brownberry, is situated on the Ashburton-road, overlooking the falls of the Dart. This also has been schemed as a holiday home.

A Pair of Cottages at Holy Vale, Isle of Scilly.—To be constructed of concrete blocks, slate roofs,; the cottages have been schemed to meet local requirements.

Dennis Farm, Manor of Reterth.—The design is typical of the small farmhouses built on the Duchy of Cornwall estate in Cornwall.

Bristol Fire and Police Station Competition.



Design placed first: By Messrs. Ivor Jones & Percy Thomas, FF.R.I.B.A. (*See p.* 575.)

TOWN-PLANNING CONFERENCE

In our last issue we gave a review of the exhibits at University College, where a Town-Planning Conference and Exhibition was held last week. In our last issue we also reported the first conference, opened by Mr. Raymond Unwin, on "Zoning Requirements of Town-Planning Schemes under the Act," held on Tuesday last week.

On Wednesday Mr. G. I. Pepler opened a discussion on "Technical Requirements in the Preparation of Schemes."

Technical Requirements in the Preparation of Schemes.

Mr. Pepler said there were present a number of students as well as those actually engaged in the preparation of town-planning schemes, and he had been asked to talk about the actual presentation of town-planning schemes. On the wall they would see a map showing the notation which had been adopted by the Ministry of Health. Many experiments were made before they arrived at this map. The first point was to define the area of the scheme, and this was done by a blue border line round the area, but not in it. The latter point was of importance, because if the border line was placed inside the area it might conflict with other colours on the map and lead to legal quibbles. The second idea was to have ground colours for densities and hatches for uses. The parts of the area for industrial purposes were always indicated by purple, and from correspondence he had had with people in America, Germany, and other parts of the Continent it would seem that purple was now very generally adopted as the industrial colour. The methods of hatching indicated the restrictions as to industry. Where they got grey and purple it meant that industries were allowed, but that this was not the predominant use. The purple hatching indicated that industrial use was predominant; whilst the grey hatching brought in shops and other things. The parts coloured grey showed they were purely residential. The white area denoted that the predominant use was residential, but they could zone subsequently on a smaller scale for particular uses. Red represented the roads, and the roads were numbered, which was a matter of importance. The green wash indicated existing private open spaces and proposed public open spaces were shown with a green ground and green hatching. For allotments they had a verdi sienna wash with a green hatching across it. The best plan in starting to plan an area was to consider the sequence of events, and the first thing to do was to make a civic survey. Even if they did not make a civic survey at first, they must carefully scrutinise the area and gather information about it; but personally he thought a fairly thorough civic survey was essential, for it seemed presumptous to lay down lines for the future development of a place before knowing all there was to know about it. It was perfectly amazing how little one knew about his own town until one came to set down the facts and study them. It was like many of the problems put forward for the solution of the London traffic problem—the suggestions generally were to add to the facilities, but they would probably add to the trouble. To arrive at a conclusion of a problem they had to get at the causes and then the difficulties might be removed. Generally there was a great deal of data available for a civic survey, but it had not been put into graphic form and had not been prepared. Professor Abercrombie told him that when he undertook the civic survey for Sheffield he found a great deal of information available at the Town Hall, and that he acted as a kind of liaison officer and picked here and there and got a complete picture. Of course they might arrive at wrong conclusions. For example, they might imagine that with a density of houses they would always find a greater percentage of disease and infantile mortality, but on comparing the maps it was found sometimes that was not the case. That led to further examination and they might find disease due to the fact that the site was low lying and was always under a smoke cloud. They might find that the wages question came into it and a number of other things. In London he got from Scotland Yard a chart of the fatal accidents in the streets complete for ten years, and he hoped to arrive at some conclusion as to the cause, but he confessed that so far he had been unable to. The theory of the police was that fatal accidents occured where they got blind corners on an open street with fast traffic. He had hoped that the theory was right, because that was a matter which might be rectified, but it did not prove to be the case when they were plotted out. The symbol he used was a black cross, and the map in many places looked like a black boarded fence. Then he compared it with a map which showed the position of all the public houses and found there was no incidence between them, and it really seemed to confirm the proverb that Providence looked after the drunkard. Well, before they had completed their civic survey they would want to get on and fix the area, and in regard to that he recommended them to take a wide view and be sure they included enough. It was a simple matter to discard part of an area if they had taken too much, but not so simple a matter to add to it if they wanted to include in the scheme land outside the area of the authority for whom they were acting; they would have to get the permission of the Ministry of Health, and to get it they would have to show good reasons. The best way was either to get agreement with the neighbouring authority and establish a Joint Town-planning Committee, and prepare a statutory scheme, or for a much larger group to appoint a Joint Town-planning Advisory Committee. In this matter it was essential to have co-operation, and it was better to do it by joint action. Some areas they might have to exclude. The built-up area of the town, if it was a big town, seemed to be not really within the scope of the Town-Planning Acts, but, all the same, they would plan it, and there were other powers under which they could proceed with regard to the built-up area. In planning, they should first make a diagram, and think of what they would like the town to be. A balance should be kept between the amount of industrial land, the population they were likely to get, and the inter-communication. Let them put down on paper what they would like the town to be, and then see what was practicable. Then they must deal with the zones—it was wrong to deal first with transport and then with the character zoning. Having fixed the uses this would affect all manner of things, such as the laying of water mains, sewage pipes, and the supply of light and power. The general practice was in the first stage to put down only the predominant use, and more detailed zoning could be done by supplementary orders. At Birmingham they showed the big roads on the official map, but in the office they had a map all filled in with schemes, so that if anyone came along they were ready and could make suggestions. With regard to density, the general average seemed to be twelve to the acre. In some places, there seemed to be an attempt to keep the districts select by limiting the number of houses to three or four to the acre, and that was all right provided it was in the public interest, as very often it was. Height zoning had been treated very simply in the Model Clauses by taking an angle of 56 degs. in a mixed area and 45 degs. in a residential area from the centre of the street. So far the question of dealing with the backs had not been dealt with, although that was of equal importance. For open spaces, the diagrammatic method was to be recommended. His personal opinion was that they wanted one acre for every two hundred people, and they should have some flat and dry spaces on which football could be played. In some towns the question of preserving land for agricultural purposes was being tackled, and he thought very wisely. Mr. Pepler d also with the question of the preservation wedges of land, and pointed out that th things should be tackled before communicati were dealt with, otherwise they would sim make such land of building value. In conclus he touched on the question of roads and urg that the planner should carefully survey t proposed roads and should preserve an adequ width of footway. With a road 80 ft. wide, th would have to duplicate the service mai This was being done under the footway, and t Surveyor of Leeds had come to the conclus that in such cases they must reserve 20 from the edge of the kerb to the fence of house. Grass margins should not be less th 5 ft. width, for otherwise people would recognise them as such.

Mr. F. G. Elcegood said it would be an en mous advantage when eventually they arrived a decision to have a uniform method of notati If the Minister of Health was sufficiently sev he supposed it could be brought about co paratively easily for Great Britain. Whet they could by some international action get same notation used in all town-planning schen he did not know, but it would be a pity if stre efforts were not made to secure uniformity the earliest possible moment. He hoped th would be able to provide for some definite ordination of schemes in groups of authoriti so that it was not left to have greater densit only where an authority would have it. densities should be where they ought to be. regard to London, for instance, it was not ri to put the large number of working cl dwellings all together in the East End, when th were magnificent undeveloped areas on northern heights. He knew it was a quest largely of transport, but that was not an surmountable difficulty, and town plann could only justify themselves in so far as th were able to solve these combined proble They must get away from the idea that work insisted on being near their work; although agreed there was a good deal of truth in statement.

Mr. J. A. Rosevear thought that many were now carrying out town-planning schei had not made a proper civic survey, and s had omitted it altogether. As to the enlar ment of areas, he found in the West Cour they were very diffident about looking over fence. One city he knew of was surrounded rural district areas; but would not consider enlargement of its boundaries or the bring in of the rural district councils, althoug seemed to him it had difficulties which co be got over by such means. The questio densities in suburban London was a g difficulty at the present time. They would agree that town planning to be successful n proceed with the good will of everybody, an the present time it would do no good if the went forth that town planning would pres land for others than the working classes. how, the London County Council was plan its Roehampton Estate for the working cla As regarded open spaces they talked a good about compensation, but often forgot the p of betterment.

Mr. C. N. Beale said he was surprised to that whilst a ten-foot unit might be necessar a narrow road with one stream of traffic in direction, yet when they got to wider roads traffic width might be less. Twelve years he investigated the question for himself Calcutta, and came to the conclusion that wide road with three lines of traffic going ir same direction they required a greater ma and they must allow at least 30 ft.

Professor S. D. Adshead said Mr. P had given a mass of information, but had emphasised the importance of some sor development of the technical plan betwee preparation of the civic survey and the prej tion of the map which had been descr Mr. Pepler had referred to a plan of the authority which was in no sense a legal but he would like to know what his real were as to the preparation of something i way of an imaginative and non-statutory for the use of the Council previously to plu into the hard legal issues. There would al

roversy on the subject of placing the
g classes in the best residential districts,
was in sympathy with Mr. Elgood in
it was not fair to drop down millions of
g class people in the most uninteresting
f a great district. He believed that a
art of what was called the spoiling of
ass areas was not the people living in
ses but the poor architecture.

EPLER, in reply, said the most important
as to have a policy about their town
g. They had to think out not only where
should be but the kind of appearance
uld like the town to have. He did not
the enlargement of a town; what he
gest was co-operation. His experience
affic units was different from that of Mr.
It was true he omitted to deal with the
ment plan, but he had that in mind
e spoke of the diagram, which included
ole town.

Regional Development.

sday's discussion was on "Town-Planning
s in Relation to Regional Development."
chair was occupied by the RT. HON
E CHAMBERLAIN, M.P., who expressed his
ion of the importance of town-planning,
erred to the Birmingham town-planning
in which he was interested some twelve
go. As a result of the experience gained
ningham he urged that in all town or
l planning schemes the greatest elasticity
be aimed at, because it was quite impos-
o know what the requirements would
ay, twenty years time. From the small
ngs of town-planning ideas had devel-
ntil it was now realised that regional
ere necessary to embrace many towns
es; he thought that very soon the whole
would be divided into regions for the
of planning, so that ultimately the
uld not be a town plan but a plan for
ole of the country.

I. G. GIBBON said people who talked
f garden city development as though it
he end of town-planning were really
ger to town-planning. Town-planners
ten too conventional and unstimulating;
should be realised that that attitude was
danger in town-planning where there was
h to learn and where the surface had
so far only been scratched. The first
of any town-planning scheme should
proper and most advantageous provision
neans of livelihood; business, not housing,
e kernel of town-planning. When any
nity acquired even a modest measure of
ity it devoted a considerable amount of
n to the decorative elements of its
e; that was another real danger, and
already been found to be a danger.
ecorative element, which was quite
ry, often received so much attention
e problem was seen out of focus, with
ult that various solutions or solutions
ere only half true were produced. That
d an unfavourable influence on the
ment of town planning in this country;
hrown things a little out of the straight
and it would take some time to put
ight. Town-planning in this country
primarily as a housing matter; housing,
e, was one of the chief requirements of
lanning, but it was not the only one.
n had been concentrated on housing
ment to such an extent that com-
ly little attention was given to the
need of the ready access of the worker
work, with the result that the transport
had been so acute that it was hag-riding
own and everyone was becoming im-
with its urgency, but its solution was
r away indeed. If business were the
of town-planning it followed that the
unit for the town plan was the business
ich was the economic unit. It might well
in some areas the economic unit coincided
area of the local authority, but, largely
o the industrial development of the last
years, that was rarely the case, and
instances the economic unit extended much beyond the area of any local authority. The economic unit generally covered the whole of a district or the whole of a region. Thus the need for regional planning was obvious. In some ways the progress made had been satisfactory, and in some ways unsatisfactory. It had been satisfactory in the progress made in forming joint committees up and down the country, and there were now twenty-five such committees. The Manchester Joint Committee represented 89 local authorities; the Birmingham Committee, 64 authorities; the Leeds and Bradford Committee 51 authorities; the smallest committee was that on Tees-side, which represented only three authorities. Considering the range of those committees the total of 25 was not, on the whole, unsatisfactory. Only one of those Committees was empowered to prepare a town plan for the district, and that was the smallest—the Tees-side Committee; the other committees were advisory. What was required at the outset was some common ground where representatives of the various local authorities could meet and have an opportunity of understanding their different requirements, where they could have opportunities of conciliating their differences, where there would be provided a point around which the regional outlook might crystallise, and where the members would gradually learn to think of their problem not in terms of their own areas, whether those areas were wide or narrow, but in terms of the whole of the district covered by the Committee. In conclusion, he said he quite appreciated the importance of amenities, and in fact a good deal more attention should be given to amenities on sound lines. But he would urge that before attention was given to those secondary problems of amenities the fundamental essentials should be set right. It would be found that the proper unit would never be less than a whole region, and that would therefore be the economic unit. Also, proper provision should be made to secure the best opportunities for production and transport, for the means of livelihood upon which inevitably depended the comfort and fulness of the life of the local unit.

Architecture and Town Planning.

On April 4 MR. G. TOPHAM FORREST, Architect to the London County Council, delivered an address on "Architectural Interests involved in the Making of Town-Planning Schemes." Mr. Andrew T. Taylor presided. In the course of his address he said it was not possible to hold a position such as his without becoming very concerned as to the principles to be adopted in the development of towns, if they were to fulfil their purpose in ways that were both practically and æsthetically suitable—for the day was obviously passing when they were to regard the development of towns and cities merely from the utilitarian standpoint. Were it not for the dominance of industrialism and commercialism to so large an extent following the mid-Victorian era—with the consequent practical setting-aside of consideration for the amenities—they would not now be suffering from the unhealthy and squalid slums that seemed almost inherent to the great towns of their country. The comparatively recent revival—if he might put it so—of the town-planning movement was, therefore, most opportune, and was already exerting a tremendous influence in changing the outlook of not only the responsible leaders of imperial and municipal government, but also the general mass of their population, including that most important person whom they called "the man in the street."

The first point he wished to emphasise was that the principle upon which towns and cities should be planned was that the community to inhabit them, though varying in character as individuals, was interdependent, and constituted one thing that could only be suitably expressed by a unified character in the planning of the city, conveying to all those who used or visited it the idea of convenience, unity, and completeness. That principle had not been recognised in this country in the past. They would all agree that many of the mistakes in the building of their towns resulted from the entirely wrong idea that a city could be built up of a number of unrelated separate units. On the other hand, the principle of unity was indeed a principle recognised to a large extent by both the Greeks and the Romans in the classic age. Their view was that the great religious and civic buildings of their cities should be arranged on a spacious, dignified, geometric principle, within the natural dominating centre of the city's life. One had only to think of the obvious cases of the Acropolis at Athens, the Forum Romanum and its other adjacent Fora at Rome—and, on a smaller scale, the Forum at Pompeii—to realise the recognition of this principle before even the Christian era. It was from this they got the regularised, simple dignity that they associated with so many classic cities. In and around those public centres of the city life were placed great religious temples and civic buildings, and towards such centres converged the main arteries of communication from the outer and more domestic quarters. The same general idea was, moreover, recognised in mediæval times, for they were even more familiar with the "Grande Place" in French and Belgian towns, in or near which the cathedral, town and market halls, and other important buildings were grouped in a spacious area that formed the natural place of assembly of the population. They also realised equally the parallel of the great "Piazzi" of Italian towns and cities, of which that of St. Mark of Venice and the Piazza del Campo of Siena were notable instances. It was natural, too, that with a revival of interest in classical art and literature in the time of the Renaissance its effect would be displayed in the grandiose lay-out of open spaces, in axial planning, and in not only the provision of great and noble buildings, but what was at least of equal importance, the formation of approaches and open spaces that would enable them to be seen and their merits appreciated in the most effective way. That, indeed, was the essence of architecture in relation to town planning. The formation of the great Corso at Rome, terminating in the Piazza del Popolo, and Bernini's colonnaded approach to St. Peter's, were two instances of the ways in which such ideas found expression. The laying out of the French city of Nancy was yet another example, while one remembered also Versailles, Renaissance Paris, and Baron Haussmann's more modern development of it.

He might mention, the lecturer continued, that this was the principle he had in view when it fell to his lot to design the lay-out of the London County Council Housing Estate at Becontree. The site covered an area of about three thousand acres, which was greater than that of Brighton. Wherever possible existing roads, farm houses and cottages had been retained and incorporated in the general scheme. Advantage was taken of a park (known as Parsloes Park) in the centre to form a central park for the estate. Arterial roads varying in width from 60 ft. to 120 ft. had been planned, some of which formed part of the Ministry of Transport's Road Scheme for the eastern area, and others for connecting up with Chadwell Heath Station on the Great Eastern Railway and with a new jetty on the river. A civic centre was planned in the centre of the estate, and was designed to form an important architectural feature to accommodate administrative and public buildings necessary for a township of the size contemplated. The radiation from it of three main roads, together with the importance of the buildings to be erected, imparted to the centre a duly impressive and dignified character.

Another estate, much smaller in area than the Becontree estate, which he had to design for the London County Council, was at Bellingham. The site was triangular in shape, and afforded an interesting example of how a peculiarly shaped piece of land might be dealt with on the principle to which he had already referred. A civic centre had been provided from which roads radiated to the main traffic roads running along each side of the estate.

His next point—and it was an obvious one—was that to plan towns in the most architecturally effective way it was necessary to take into account their characteristic natural features—to make use of hills or risings in the ground for the placing of important buildings so that their elevated position might enhance their effect, as, for example, with the Palais de Justice of Brussels, which dominated in a most remarkable way the whole of the city. If a river flowed through the town, that also should influence to a large extent its main traffic lines and the placing of its bridges, buildings and monuments, so as to be most effective. It would, however, be realised that there was little chance of doing anything of this kind on a great scale in an area already built up, such as London, but even in London careful attention should be given to this matter in the development of new housing estates within the county. At any rate, this principle had been adhered to in designing the London County Council estate at Roehampton. In framing the lay-out of that estate special regard had been paid to the preservation of the amenities of the neighbourhood; and natural features, including the finer trees, had been retained and absorbed into the scheme as far as possible. The estate was approached from Upper Richmond-road through a belt of trees, and there was a row of fine trees on the land immediately east of the estate.

The lecturer, in conclusion, dealt with the built-up areas of existing towns and cities. They obviously could not bring existing towns—so many of which had been developed in a purely haphazard way—within the strict limits of their generally Utopian scheme of things; but with all of them it was doubtless possible to create improvements that would, in the course of time, bring them at least a stage nearer the ideal.

At one time in the Tabard-street area, situated in Southwark, they had a labyrinth of mean streets, covering fourteen acres in extent and containing about 650 houses. The mean streets had now been swept away, new roads constructed, healthy re-housing provided, and, perhaps best of all, an open space of five acres created in a district which was altogether inadequately served in this respect. In ways such as this the London County Council was constantly seeking to carry out alterations which should improve London. It would be comparatively easy, he thought, to draw up a plan for the improvement of the whole of London on the bases of the accepted principles of town planning. It would be, perhaps, a good thing to have such a plan, but the actual carrying out of the plan could only be accomplished in the course of many generations, perhaps centuries. Possibly such a plan would enable the man in the street—the man who really counted, after all—to see what London might be, and, in this way, induce him to assist in its becoming so. It would be a wonderful London, but it would have to be the same London. He, personally, would be very much opposed to any changes which would rob London of its own peculiar charm, and that "something" which made it so different from every other city they knew. The town planner was not a destroyer where old cities were concerned. He took the city as it was, and he changed it, but the change was not a change of character. Nothing was lost. The old glory remained, but it was an enhanced glory, making its citizens proud of their inheritance, and prouder still that they had had some part in securing that the city which they should leave behind should be indeed "a joy for ever."

Mr. Andrew Taylor said he considered architectural treatment was the soul of town planning. Without imagination and artistic sense it would become a mechanical matter. There were two methods: one the sheep-track, and the other the formal. Most towns in England were founded on the sheep-track principle: in Chichester and Edinburgh they had examples of careful town planning. London, however, was planned in patches. There were charming little bits, such as Bloomsbury; but as a whole London had been allowed to grow up without planning. He would like to see the vista, well known on the Continent, in English town planning. The Arc de Triomphe and the Opera House, Paris, were fine examples of the successful vista; but in England it seemed studiously avoided—perhaps it was due to sheer indifference.

Mr. Barclay Niven said it was most desirable that round London they should have open spaces. Not necessarily parks; they might have farms, and open breathing spaces for the people that could not be built upon. A good deal could be done to ease traffic by considering things on the outskirts. He suggested taking the hospitals out into the open, clear spaces: many buildings might be placed out beyond the centre. A river was a great asset to a town, but in London full use had not been made of the possibilities of the Thames.

EXHIBITION NOTES

THE WALKER GALLERIES.

The charm of water-colour drawings is sadly missed by many who devote a great deal of time to their production, and we imagine that many who essay this beautiful art would come to much better results in oil or some other medium. The purity, the delicacy, and the transparency which please us so in the best work are so conspicuously absent in a large number of the drawings annually produced that it is difficult to see why so much work of this kind is done, unless it be through sheer ignorance of what is desirable or the way to obtain it. Something of the fine qualities of water-colour art is apparent in nearly all the work of Margaret Bernard, especially nice being Nos. 5, 6, 21 and 23. In 21, "Oreston Quay, Plymouth," we find a simple directness of expression which is very pleasant and attractive, and the quiet reticence in "The Grey Morning, Littlehampton River" (29) betrays no over-conscious effort such as spoils so many drawings. The bold handling of Lillah Fellowes' ninety-one drawings of Italy is justified by results, for this artist has a good sense of colour and a feeling for form and texture which is not allowed to destroy transparency or atmosphere. This is an interesting collection of drawings which vividly reflects local character and detail. Amongst the most attractive drawings are Nos. 2, 14, 36, 40 and 65. If all the drawings by Major Wilkinson had the reserve and unity of effect of "The River at Chelsea" (97) the exhibition of his work would rank much higher. He has produced a good effect of "The Admiralty Arch" (81), and an excellent sketch in black and white of "Ancient Houses, Dinan" (25). His widely extended efforts are generally overwrought and doubtful in colour and drawing.

THE ST. GEORGE'S GALLERY.

When we come to the work of the modern English Water Colour Society at the St. George's Gallery, we can hardly believe the pictures will persuade the public to credit the world with such aspects of colour or drawing. There is certainly one drawing with tone and colour value, "Flask, Walk, Rain," by Charles Ginner. There are several black and white drawings in the gallery, but even these make no adequate atonement for their fellow exhibits.

Collapse of a Crane.

A 60 ft. electric crane used in the rebuilding of part of the Café Royal collapsed recently in Regent-street. Apparently it was either the parting of a steel guy-rope or movement of the bed of the crane, which was on scaffolding 90 ft. high, which caused the accident. The crane was being used in unloading rolled steel bars, and fell across the girders below and on the roof of the rear portion of Oddenino's Restaurant in Regent-street.

Visit to Kensington Palace.

By the permission of H.M. Office of Wor a visit to Kensington Palace has been arrang by the Art Standing Committee, to take pla on Saturday afternoon, April 26. Members a Licentiates who wish to attend should ap to the Secretary R.I.B.A. as soon as possible.

The Annual Dinner, 1924.

The annual dinner of 1924 is to be held May 6, at 6.30 for 7 p.m., at the Trocade Restaurant, Piccadilly, W.1.

Cricket Match.

The Architectural Association Cricket C have challenged the R.I.B.A. to a cricket mat to be played on the A.A. ground at Boreha Wood, on Saturday, July 12. Mr. M. H. Doll has consented to raise the te to represent the R.I.B.A., and would be gl to hear from any playing members who wo be willing to take part. Address: 5, Sou ampton-street, Bloomsbury, W.C.1.

THE ROYAL INSTITUT OF BRITISH ARCHITECT

PRIZES AND STUDENTSHIPS, 1924–19

The following prizes will be awarded January, 1925:—

The Royal Institute Silver Medal and £50, Essays.

The Royal Institute Silver Medal and £50, Measured Drawings.

The Tite Prize: a Certificate and £100, travel and study in Italy. A Design for a Sm Museum is the subject set for the year.

The Pugin Travelling Studentship: a Sil Medal and £75, for travel in Great Britain a Ireland, and study of Mediæval Buildings.

The Godwin Bursary and Wimperis Beque a Silver Medal and £130, for travel outside Gr Britain and Ireland, and study of modern ar tecture abroad.

The Owen Jones Travelling Studentship: Certificate and £100, for the study of ornam and colour decoration.

The R.I.B.A. (Henry Jarvis) Travell Studentship: £250, at the British School Rome.

The R.I.B.A. (Alfred Possom) Travel Studentship: a Gold Medal and £250 and Sil Medals, for the study of Commercial Archi ture in America.

The Grissell Gold Medal and £50, for De and Construction. The subject of a Dance has been set for the year.

The Arthur Cates Prize: £50.

The R.I.B.A. (Archibald Dawnay) Sch ships.

The Ashpitel Prize: £10 (in books).

The R.I.B.A. Silver Medal for Recogn Schools.

Sending-in date 4 p.m., November 28, (except where otherwise mentioned).

The R.I.B.A. prizes pamphlet containing information on the various prizes and stud ships and the detailed programmes for the petitions may be obtained (price 1s.) at R.I.B.A., 9, Conduit-street, W.1.

The prizes this year total in value n £2,000. Since last year the following alterat have been made:—

Candidates who have entered for the S Medallion or the Tite Prize are permitte submit their drawings in place of the problems in design required for the final ex nation.

Candidates who have been awarded the S Medallion or the Tite Prize or who have rec a certificate of Hon. Mention in either of competitions receive exemption from the d portion of the final examination.

The age limits have been extended by years in the case of those prizes for which a limit is stated.

The values of the Essay Prize and the A Cates Prize have been increased to £5 annum each.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

We are glad to give questions and answe
annot accept responsibility for contributed
s, especially on legal matters.

y we appeal to our correspondents to
t their queries on paper of a size easily
and written as legibly as possible, or better
n typescript?—ED.

[*re* LIBRARIES AND INHABITED HOUSE DUTY.]

—Three points are raised by this ques-
(1) Is a library chargeable to the in-
d house duty? (2) Would a caretaker's
rs, directly connected to the library, and
unicating therewith, make the whole
ng chargeable? (3) Would cutting off the
ker's quarters from the library, with
te access to the outside, make the care-
s quarters alone liable to the duty?
regards (1), in Styles *v.* Middle Temple
), 68 L.J. Q.B. 1046, it was held that
all of the Middle Temple is liable to the
and that the library, being essentially
nt from a "hall or office," is not; on

de and business houses, or tenements,
distinct properties, solely used for any
or business, or any profession or calling
nich the occupiers seek a livelihood or
are exempt. See Nichols *v.* Malim
, 1 K.B. 272. The exemption is not
y allowing a menial or domestic, or
r person employed by the occupier, to
in the house, solely for its protection.

From the above it would therefore appear:—
1. Any library open to the public is assessable, and a caretaker's quarters, in the same block, with or without separate access thereto, would be assessed as part of it, making one subject. Where the library and quarters were entirely separated, there would be two subjects.

2. A library not open to the public, but used by its owners for the reading of books only, and not run for profit, would not be assessable.

3. If, however, such a private library had attached to it quarters for a librarian or sub-librarian, part of whose salary was the said quarters, then the private library would be considered as part of his dwelling house, and the whole building assessed.

4. But in the London Library *v.* Carter above, it seems suggested that if the person inhabiting such quarters was a caretaker pure and simple, that is, in no sense having charge or part charge of books, then the library portion of the block would be exempt.

The cases would appear to show a parallel to the distinction made when a professional man's whole house (*i.e.*, including, *e.g.*, a surgery, consulting rooms, etc.) is assessable as one subject; but the tradesman or shopkeeper can claim exemption for that part of his premises (factory, warehouse, shop, etc.) which are used exclusively for business, even if they communicate.

READER.

[REPLY TO "DESIGNER."]

SIR,—I think there is little doubt that a caretaker's flat, even though directly connected with a library, would be treated as a separate unit for this purpose much as each flat in a block of flats, though all connected by a common staircase, would be treated as separate. The intention of the law is quite clear and would surely be administered in this spirit.

A. B.

Theatres.

SIR,—I should be obliged if you could furnish me with the following information:—

The position, in relation to the main stage of a theatre, of an apron stage, with two extra proscenium openings. I should also like to be informed of the position of the two extra proscenium openings in relation to the apron stage.

"PERPLEXED."

Miserere or Misericord.

SIR,—Can you inform me which of the following terms is the more correct, "Miserere" or "Misericord." The former is used in Parker's "Glossary of Architecture," and the latter by modern writers.

The latter term has been used to designate the "flesh-eating halls" of the later monasteries.

R. A. B.

Zinc Roofs.

SIR,—I have found that the life of zinc can be extended by an occasional coat of "Siderosthen" solution, which is a form of bitumenised paint, applied after the metal has become rough by a year or more exposure so that the paint may get a grip. Rusted iron also for the same reason is better, provided the rust dust is brushed off thoroughly before painting. For many years I have invariably used "Sideros" for the inside of eaves guttering.

MAURICE B. ADAMS.

Portraits of Inigo Jones.

SIR,—Having before me a portrait, on vellum, in Chinese wash, oval, 4 in. by 4½ in., of this architect, by himself, I send you a line that it may be added to your list. Two drawings by him done in his student days in Italy (small folio) are also of interest.

P. A. ROBSON.

[REPLY TO "SUBSIDY."]

SIR,—The reading of the regulations of the Ministry of Health seems quite clear upon the point rased by your correspondent. I certainly understand by them that building over a porch would bring such porch within the containing walls of a house. The Act is for the purpose of producing a certain type of small house, and is worded with the express intention of preventing a larger type being admitted by any tricks.

"FAIR PLAY."

WATERLOO BRIDGE

A FURTHER report, brought forward by the Improvements Committee, which came before the L.C.C. recently, when the Council took up the consideration of the proposed scheme to widen the bridge at an estimated cost of £1,000,000, states: There is a condition of unstable equilibrium, and it has to be borne in mind that such a condition often tends rapidly to become worse.

The report shows old drawings from which it can be seen that the foundation of each pier and of the abutments consists of timber piles about 20 ft. long, driven in rows. Each row is capped by a whole timber sill or sill piece, across which further whole timber sills are laid, forming a gridwork of timber about 2 ft. deep above the piles, the interstices being packed with stone. The gridwork is covered by a decking of timber about 6 in. thick, upon which the masonry of the piers rests and was built. The bed of the river in and towards the centre is composed of gravel, but underlying the gravel is the London clay, which extends downwards for a great depth. The thickness of the gravel bed is relatively small. Under the masonry of the third and fourth piers from the Lambeth side the gravel is only about 9 ft. to 10 ft., consequently piles of the length shown in Rennie's drawings would pass right through the gravel and be standing in the London clay. It would appear from the original drawings that when the bridge was constructed the tops of the timber platforms were everywhere below the bed of the river. Such is not the case now, however, as in many cases the bed of the river between two platforms has been so eroded or scoured out that it is lower than the top of the platforms—that is to say, it is below the bottom of the masonry of the piers. The erosion or scouring is of long standing, and in 1882-84 the Metropolitan Board of Works expended about £62,000 in laying concrete slabs around the timber platforms with the object of protecting them from erosion or scour. Settlement has occurred practically throughout the bridge, but is far more pronounced at the fourth pier from the Lambeth side than elsewhere. There is, in fact, a condition of unstable equilibrium, and it has to be borne in mind that such a condition often tends rapidly to become worse.

The report adds: Remedial measures are being taken in the hope that the settlement may be arrested, but that it is too early yet to say whether these will be successful. These measures are not being tried with the hope that they may prove a permanent solution of the problem. They are only temporary remedial measures, having for their object the maintenance of the uninterrupted use of the surface of the bridge for road traffic, or the waterways of the bridge for river traffic until a temporary bridge can be provided.

Mr. Barclay Niven, at the recent Town Planning Conference at University College, suggested that if Waterloo Bridge had to be rebuilt, the London County Council, instead of going to the expense of a temporary structure, should secure possession of the Charing Cross Railway Bridge, and use it for vehicular and pedestrian traffic; the payment to the railway company to be reckoned as part of the compensation they would receive for taking their station over the river.

At a meeting of the Council on Tuesday it was decided to proceed with the widening scheme.

THE BUILDING TRADES EXHIBITION

[The Building Trades Exhibition at Olympia is to be opened to-day by the Minister of Health at twelve noon, Mr. J. A. Gotch, P.R.I.B.A., in the chair. The Exhibition closes on April 26. A plan of the Exhibition and a complete list of exhibitors were given in our last issue.]

BUILDING, 1914-24

By T. P. BENNETT, F.R.I.B.A., Hon.F.I.O.B.

Such an event as the Building Trades Exhibition affords an opportunity for taking stock of the position of building. Has it advanced or is it falling upon bad days? Is there vitality or stagnation, sound or execrable design, progress or retrogression? These are fascinating queries and range themselves under a number of heads.

1. The development of design.
2. The kind of buildings which are in course of erection.
3. The materials which are in use.
4. The development of labour-saving equipment.
5. The development of decorative materials.
6. The development of machinery and mechanical appliances.

Development of design is placed first, because if design is dead there can hardly be life in building. An examination of *The Builder* for 1914 and for 1924 proclaims at once that architecture is more full of the breath of life than it has been for many years. With the increasing fire and enthusiasm in the profession has come an ever-increasing standard of architectural journalism and of methods of reproduction. It may safely be said that never before has architecture been so well served in this respect.

In 1914 the Schools of Architecture were just making themselves felt. The first Atelier was working at top pressure under the able guidance of Mr. Arthur Davis and the brilliance of Mr. Chaures. The R.A., Glasgow, Manchester, Liverpool, and other schools were housing groups of enthusiastic students whose work was attracting much notice and attention. This work had still to make its mark upon the actual buildings in course of erection. Many of the buildings illustrated were dull, and others were but slowly throwing off the stiffness and incomplete development of the latter years of the nineteenth century. Here and there a scheme of more than ordinary interest showed that there was life below the surface and that its vitality would soon dominate the architectural world.

The house appeared only in its larger forms. The housing problem as such hardly existed. If it existed, the public were hardly conscious of its existence. Architects rarely turned their attention to the small problems involved, and if they did their efforts were rarely illustrated. Development was taking place in 1914, but it was the slow development of orderly evolution. The machine was moving, but moving ponderously. A few adventurous spirits like E. A. Rickards and Robert Atkinson were appearing as the head of a column of keen students seeking below the surface, straining every nerve to show their capabilities to free architecture from its lethargic state, breathing vitality and energy, and showing by their works that they were going to accomplish something of note in the not far-distant future.

There can be no doubt in the mind of the calm observer that 1924 is far more intense than 1914. That progress has been made and is being made. That the field of architecture has widened considerably and that the general level of architecture is higher. Architectural design seems to have become broader in treatment, more logical, more full of personality, and therefore much more interesting. There is evidence in the press that architects are studying more; they are anxious for more definite and more extensive information; and so is seen a wide range of articles on Italian, French, English and American work, both contemporary and otherwise.

Two kinds of buildings stand out prominently in 1924. One is the group of buildings relating to housing and the other the group relating to commercial buildings. In 1924 the housing problem has returned, but with its return has come a desire on the part of the public to have not merely more houses, but to have better houses and to have each house possess a modicum of personality even though it be small. Whether, therefore, it is through the medium of the men in private practice, through the official architect, or through that unfortunate transitional official, the architectural assistant to the Borough Engineer, there can be no doubt that architectural design has become part of the small house in a way that was unknown in 1914. But the design of the house is only one of its amenities. The planning of the small house has been studied to an extent and with a purpose only faintly echoed in 1914 by Letchworth, Hampstead Garden Suburb, Ealing, Bournville, and Port Sunlight. The house has come to occupy a position in the forefront of architecture, and is no longer its ugly sister. None can doubt that this movement is yet in its youth, for if 1900 saw the birth of the architectural cottage, 1924 sees still only its adolescence.

Side by side with the house has come the architectural development of business premises. In 1914 the Selfridge building in London stood almost alone as an attempt at a serious modern architectural shop. In the city some banks and a few insurance offices were attempting to indicate the fact that architecture need not be the monopoly of the public building, the Government office, the mansion and the country house. In 1924 all progressive business men are realising the importance of distinctive architecture and its value to business. It is even possible to feel that many commercial men are beginning to admire fine buildings for their own sake, and to imagine that the day will come when bad design will carry its own condemnation. This ideal is at the moment but a child of the imagination of the architect, for commercial architecture, like housing, is still in its youth.

The materials of building have suffered a severe and critical examination during the period under review, and it is even yet difficult to determine the precise result of this wholesale questioning of precepts and materials of age-long acceptance. The war created the need for the exploitation at one and the same time of any and every means of erecting structures. Tests were forced upon builders they would never have dared to attempt under normal conditions. Wood, asbestos and terra-cotta vied with brick and concrete for speed of erection, cheapness and solidity; and in 1924 it is time to take stock of these experiments and to try to deduce from them some results of permanent benefit and value.

The plethora of concrete block-making machines which once flooded the market has gone, but there still remain some of the better types. In some cases, no doubt, unsuitable aggregate has been used, and this has brought discredit on the concrete. Brick, however, is generally preferred as a building material for small houses. There are some processes that somehow or other have stood the test of time, and are still in active use. There can be no doubt that sooner or later a system of concrete construction will be evolved that will be cheap and at least as efficient as brick, and will reduce the somewhat unpleasant and tedious task of assembling small units. In this di tion further development in concrete build must be anticipated, the present position be a *hiatus* between the unlimited experiment the years 1918-21 and a future sound, relia and economic method of building small hou in good concrete.

In conjunction with various flooring c pounds designed to take the place of boa marble and similar substances, there can no doubt that a great future lies before artificial building material in its many for All exhibits of this class should therefore examined, because, while perfection has ye be reached, there will come a day when artificial material will be employed upo very extensive scale and will have great vantages over natural materials as rega cost, reliability, speed of erection, and eas handling. Whether these materials will e succeed in giving texture and beauty equa the products of nature remains to be see

The next great group of developments require study are those relating to lab saving equipment. Labour is dear, and likely to remain so. All men want eithe life full of interest or the shortest poss hours of labour. All monotonous or ted tasks must therefore be performed with minimum of effort, at the lowest cost and w out extensive initial outlay. These lab saving appliances range from woodwork brick and stone-cutting and other machine vacuum cleaners, electric and gas equipn of various sorts, and incidental items automatic delivery doors and piano-play In 1914 this great group of important ma was at the beginning of its development, with the exception of woodworking and o machinery, almost unknown. To-day n of the items mentioned have come to stay, there can be no doubt that many other bran of this fascinating subject will receive at tion in the near future. The architect, builder, and the householder should all familiar with development as far as it gone at present.

This decade has, however, also seen pro in the standard of the artistic taste of public and of the demands of the architec more artistic materials. Many decorative ducts have, therefore, received attention. enamels are finer, the colour range is gre the choice of materials available is infi wider than it was at even so recent a da 1914. This artistic development is still t place, and the great group of decorative must therefore be carefully examined t the latest things that are waiting for designer to use, and to suggest new dire in which his skill may be developed an brain evolve attractive finishings for his ings. This group of materials is not co to surfacing: there are vitreous tiles, treatments for wood panelling, new b ware for curbs and hearths, new kinds of and enamel, and a vast range of fittin electric and other lighting which must b and remembered.

For the purely practical man has co mechanical handling of material. Co mixers and depositors, hoisting apparatus and concrete breakers, petrol engines, cranes, and many other products whic the result of efforts to solve the labour p of to-day and to minister to the co demand for speed of erection and econ

As a summary it may be said that the 1914-24 has shown progress in a materials of all kinds, labour-saving equi decorative materials, and in the machi the mechanical handling of building ma These are at the moment the points of progress, and it is to these groups that and interest will be directed.

TEN YEARS OF CONSTRUCTION

By EWART S. ANDREWS, B.Sc., A.M.Inst.C.E., M.I.Struct.E.

Although the war years absorbed half the last decade considerable progress has been made in construction. While it is true that during the war ordinary building work was at a standstill, there was great activity in the building of factories, aircraft buildings, and military buildings of all kinds; and the shortage of materials and labour, combined with the urgent necessity of rapid construction, gave several of the newer forms of construction a more extended trial than they would probably have received in this country if things had continued in the even tenour of their way during this period.

At the end of the war optimistic politicians, surely against the better judgment of their better informed, if less scintillating, technical advisers, promised ideal homes for all and embarked upon a housing programme in which many experiments were conducted and many mistakes were made. When, therefore, there occurred the inevitable bump which pulled the scheme up short, the building industry received a set-back from which it is recovering but slowly. It is now convalescent, but is rather afraid of a relapse.

All kinds of construction were tried during the housing big push; some were ill-digested schemes which ought never to have been started, and others were promising ones which went wrong because their parents tried to make them run before they had mastered the stage of walking. Many valuable experiments were, however, made and some modifications were introduced which will gradually gain recognition as definite improvements in construction.

With regard to the experiments made, largely under the guidance of Government departments, we hope that someone with a flair for digesting data will prepare a review which will put the results in easily digestible form before the building community; it is given to but few to extract much nourishment from Government reports—somehow their very appearance takes away the appetite. But much information of very great value to the building industry has been published in official reports, and yet comparatively few people seem to have studied these reports in sufficient detail to apply the results to practical design.

The building fraternity are a thoughtful people, but they do not like print; practical men in the building industry usually do not believe that the statements in books are true. Their craft was in a flourishing state while Caxton was learning his letters, and they never learnt their trade from books, so how can books be much good? Perhaps some day the scientific bodies and Government departments will have their reports popularised by publicity men.

The principal developments in construction during the past ten years have been in steel frame and reinforced concrete construction, and it may serve a useful purpose if we divide our review into these heads.

Steel Frame Construction.—By a steel frame building we mean one in which the whole of the loads on the building are carried by a steel framework; the walls cease to provide any stability to the building and merely serve to keep the weather out in the case of external walls and to divide the building up into suitable rooms in the case of internal walls.

Steel frame buildings were made permissible in London by the 1909 London County Council (General Powers Act (commonly referred to as the Steel Frame Act); the authorities responsible for this Act were naturally somewhat nervous, with the result that the provisions of the Act are in many respects unduly stringent and result in unnecessary increase in cost—thus taking away much of the advantage of the method of construction which the Act was apparently intended to encourage. In the drafting of the Act the authorities made the blunder of specifying the working stresses and other details of construction. The result is that although experience and further knowledge has, we believe, definitely proved that the clauses are too severe, nobody can relax them until a fresh Act of Parliament has been passed—and Acts of Parliament have a knack of taking a long time. If the Act had left the details of construction to be embodied in Rules made under the Act—as it did for reinforced concrete because, fortunately, the time was not quite ripe to specify the details of design and construction—the detail provisions could have been relatively easily altered when experience had shown amendment to be desirable.

The result of the provisions of the Steel Frame Act is that it is often cheaper to erect a building designed with the thickness of walls specified under the old Acts for an ordinary brick building, all the internal portion of the building being designed upon a steel frame, than to erect a building designed as a steel frame building under the Act. This anomalous fact is one that requires careful explanation to avoid misunderstanding and ought clearly to be understood by all architects, because when once the building industry realises this fully we are convinced that sufficient agitation will arise to force the authorities to take steps to alter the law. We, therefore, think that some useful purpose may be served if we explain at some length how this situation has arisen.

In the first place, we should explain that under the Steel Frame Act the District Surveyors are called upon to see that the provisions of the Act are fully complied with, and full calculations showing the strength of every beam and column (called pillar in the Act) in the frame have to be filed with the Surveyor. At this stage we might point out that it is quite foolish to grumble at the District Surveyor for his requirements that the provisions of the Act shall be complied with; the District Surveyor is a public official who has a difficult task to perform, and who nearly always performs it with remarkable tact and patience, and he has not the authority to alter the Act—he must insist upon its observance. The District Surveyors are not responsible collectively or individually for the provisions of the Act—they are only there to see that they are carried out. It is reported that in the saloons of the Wild West, before the drought, a notice was sometimes put up which read "Please do not shoot at the pianist—he is doing his best"; something of the kind might be put up in the District Surveyor's offices.

The anomaly to which we refer arises from the fact that the floor loads specified in the Steel Frame Act are in most cases unduly high and the working stresses allowed are unduly low in many cases—particularly in the case of columns or stanchions. Then, again, the Act provides that for fire protection purposes the steelwork must be encased in fire-resisting casing, which is usually of concrete; this concrete casing undoubtedly adds to the strength of the steelwork, but no such addition of strength is permitted in the calculations, and as the weight of the casing must be taken into account in the loads its effect is to require still more steel to carry it.

In order to make clear that we are reasonable in our contention as to the low stresses allowed for steel pillars we take the case of a single-story stanchion 12 ft. long, required to carry 70 tons. Under the L.C.C. regulations the District Surveyor would regard this stanchion as equivalent to one having one end hinged and one end fixed and we should have to use a 10 by 8 by 70 section, the permissible load on which, by the L.C.C. Act, is 73.7 tons. If we look up the handbook of a well-known firm we shall find that this stanchion is listed as safe for 123 tons; now the figures given in this firm's handbook are derived on the formula given by Mr. J. Mitchell Moncrieff, M.I.C.E., in a paper which showed a very scientific and exhaustive investigation into the whole subject, including the analysis of thousands of test results, and we have never seen any serious challenge as to the safety of Mr. Moncrieff's figures. As far as we are aware the Borough Engineers all over the country will accept these figures, so that we arrive at the ridiculous result that a stanchion which is only safe for 73.7 tons in London is safe for 123 tons anywhere else.

In advocating amendment in this respect the writer is not advocating a reduction on the real factor of safety of the building, nor does he approve of any attempt to reduce the attention given to the design of the details of joints and connections; he only wishes to avoid the waste of steel which arises from buildings designed under this Act and to make possible the efficient economical design of steel frame buildings. In short, he wishes to see the regulations so drafted that it may, in fact, be possible to employ the steel frame method of construction as a more economical method than that of building with thick brick walls; there is not the slightest doubt that steel frame buildings are more economical than brick buildings for the same strength.

The "Power of Waiver."—There is a tendency to overcome the objections which some engineers have to the Steel Frame Act by extending the "power of waiver" which the London County Council already has under the Act in respect of certain of its clauses. Under this procedure application has to be made to the London County Council for permission to waive or modify these clauses, and the intention appears to be to extend this power to the whole Act. To this course the writer sees very strong objections; in the first place, there is the objection from the engineer's standpoint of having two different sets of officials to deal with. This leads to a division of responsibility which leads to friction between the officials and to great delay in the prosecution of the work. The practice also leads to administration by precedents and leaves it very uncertain as to what may be permitted and what may not.

We object most strongly to having to go to the expense and trouble of applying to the London County Council for permission to do something that arises in everyday practice and that everybody should always be allowed to do. It is like making a law that everyone must wear pink trousers, but that they may apply to the Council if they wish to wear trousers of any other colour. In making this objection to the extension of the power of waiver we hope no reader will infer that we have any complaint to make against the officers of the Council who deal with these matters; we have invariably found them courteous and reasonable.

The Advantages of Steel Frame Construction.—These questions of Building Acts and Regulations are not very interesting; they are, on the contrary, extremely dull, but unfortunately they are very important, and in spite of their dulness we think that all architects and engineers should study them sufficiently to be able to fight against them; this idea of every different town having its own pet regulations is becoming a disease.

We will pass, therefore, to the consideration of the advantages of steel frame construction. The first advantage is speed of erection; not only have we increased speed of erection of the whole building, but the frame may be run up quickly and thus the building can be roofed in at an early stage, thus keeping out the weather and enabling the work to proceed with much greater comfort for the men. The next advantage is saving in cost—although, as we have previously pointed out, the existing L.C.C. Steel Frame Act does not enable this to be fully realised. Another advantage arises from the fact that since with a steel frame building we do not rely upon cross walls for the stability of our building, the planning of the interior portion may proceed upon more elastic lines than are possible with an ordinary brick building.

While speaking of the question of planning we would like to point out to the architect the great advantages arising from consultation with the structural engineer at an earlier stage in the development of the plans than is now usual. One of the great troubles with which the engineer has to deal is that of oft-recurring alterations and modifications, many of which

arise from insufficient time being given to the engineer in which to design the steel frame in detail and to discuss modifications in planning made desirable from considerations of the steelwork. The architect, of course, has his own difficulties in getting his client to come to a decision, but it would help matters if everybody realised the increased trouble and expense involved in leaving the complete design of the steelwork to a period only just before the plans and specifications are ready to go out for tender.

Reinforced Concrete Construction.—Reinforced concrete has made great strides during the past ten years; the method of construction has now been in use for sufficient time to satisfy an apprehensive public as to its lasting qualities, and further experience both in the technicalities of the design and in the practical details of the construction has enabled us to feel more confident than ever of the great value of reinforced concrete as a constructive material.

One of the difficulties under which concrete construction laboured for many years was that architects did not take very kindly to it, with the results that the works carried out were mostly done without the co-operation of an architect and so lacked that character and proportion which characterises the work of a good architect. The buildings looked ugly, therefore, and people at once said that concrete was a hideous material, forgetting how dreadful brick buildings can be made to look when designed, if designed at all, by someone ignorant of architectural treatment. Gradually, however, we are evolving a style of concrete architecture, and in the humble opinion of the writer—a mere engineer—some of the modern reinforced concrete factories have a very fine appearance. Concrete construction is so elastic that it lends itself remarkably well to architectural treatment—you can do anything with it.

The British Empire Exhibition at Wembley has given concrete construction in this country an opportunity of making good which, it is believed, will have a lasting effect upon its increased adoption as a constructive material. In the Stadium and the Machinery Hall we see the excellent effects to be obtained by the combined efforts of a far-sighted and enterprising architect and a capable and ingenious engineer; we do not know who is responsible for the introduction of the "scrubbing-board" finish for the concrete at Wembley, but it is an inspiration.

Reinforced Concrete Floors and Retaining Walls.—In addition to increased use of reinforced concrete as the material for the whole building, the past ten years have seen tremendous advances in the use of reinforced concrete for floors and retaining walls. In most of the steel frame buildings of the present day some form of reinforced concrete flooring system is employed. Several firms of contractors specialise in floor construction and construct a proprietary form of floor which is usually called a "patent" floor. In general, particularly for factory and warehouse work, we believe that the most economical form of floor is the ordinary reinforced concrete floor employing plain bars; in other cases the hollow-tile form of floor is often practically as cheap and possesses special advantages in buildings in which the floor loads are comparatively low. This form of floor has an advantage in sound insulating properties and usually makes a better job for plastering the ceilings underneath; it is therefore particularly useful in offices and hotels.

Pre-cast floor-units of reinforced concrete also have their advocates; they have the advantage in saving centering and also in enabling the floor to be used almost immediately after laying. In some cases, however, we believe that against these advantages we have to place an increased cost compared with ordinary reinforced concrete.

The increase in site values and the limits to the heights of buildings have made it common in London to have one or two floors below ground level; this usually involves the construction of retaining walls for which reinforced concrete is the constructional material *par excellence*. The design of retaining walls is a subject which has some difficulties owing to the variable behaviour of earth in producing horizontal thrust, particularly in cases in which the adjoining ground is loaded either by buildings or by road traffic. It is therefore a mistake to design retaining walls upon rough rules such as those given in some of the older pocket books, but the absence of failures with reinforced concrete walls designed by engineers who are familiar with the theory of the subject should prove that excellent results can safely be expected from a reinforced concrete retaining wall designed upon modern lines.

L.C.C. Regulations.—The erection of reinforced concrete buildings in London is governed by the regulations issued in 1917 by the London County Council, and as most other municipal authorities in this country adopt the L.C.C. Regulations as a standard, a very large amount of the reinforced concrete work in this country is governed by these regulations. They, like the curate's egg, are excellent in parts; but are generally unwieldy and too conservative in respect to some of the units, particularly the columns or pillars. We have no doubt that before long revised regulations will be issued which will enable the cost of reinforced concrete to be reduced to some extent without lowering the factor of safety of the structure.

Some of the remarks which we made with respect to the Steel Frame Act apply equally to the Reinforced Concrete Regulations; for instance, we think that the specified floor loads should be reduced. While we see grave objection, as previously pointed out, to the policy of overcoming the legitimate objections to the regulations by giving the Council a general power of waiver, to be exercised in respect of any of the regulations, we are strongly in favour of the Council having the right to accept designs for new constructions to which the present regulations obviously do not apply. As an example of this we mention the case of "mushroom" floors, for which there is no provision at present, but which the Council should have the power to allow if they are satisfied that the design is satisfactory.

Advantages of Reinforced Concrete.—Reinforced concrete undoubtedly costs more to design properly and requires much more supervision in construction than structural steelwork, and these facts should be fully recognised at the outset. In spite of these drawbacks, however, reinforced concrete in many cases has been proved to provide the most economical construction. If the design is good and the work is carried out under good supervision, we believe that the resulting strength of the building if tested to destruction would be found to provide a considerably greater factor of safety than is commonly assumed, so that there is a very considerable margin to make up for the shortcomings which might arise from failure to fulfil the best conditions for concrete construction.

As a result of the great improvements which have taken place in the manufacture of Portland cement since reinforced concrete first came into use, the cement manufacturers can now guarantee a strength considerably in excess of the minimum called for in the British Standard specification. Engineers have learnt during the past ten years a good deal more about the strength of concrete than they knew before, and the importance of the amount of water used in mixing is now known to be very great. It is easy by using too much water to reduce the strength of the concrete as much as by omitting one-third of the amount of cement in each sack.

In reinforced concrete design great care has to be taken in the exact detailing of the reinforcement to ensure first-class construction, but reinforced concrete develops such great strength when the concrete itself is made under careful supervision and with meticulous care to follow accurately the specification, that slight errors in the design and placing of the reinforcement may not have serious results in the construction. In saying this we do not wish to minimise the great importance of accuracy in the design and placing of the reinforcement; we mention it to allay the fears of some people who point out that in the actual construction the position of some of the rods may be displaced and who imagine that for this reason reinforced concrete is likely to prove unsafe. There is not the slightest doubt that reinforced concrete when carefully designed and carried out with reasonable skill provides an economical structure with a very great margin of strength.

We believe that the next ten years will see even greater developments in reinforced concrete construction than has taken place in the past ten years. Concrete construction has just survived its growing pains, and can look forward to a long and full life—a new stone age has dawned which will leave a lasting mark upon the civilised life of the future.

MEETINGS AND CONFERENCES AT THE BUILDING EXHIBITION

Among the arrangements at the Building Trades Exhibition at Olympia are the following:—

Saturday, April 12.—Visit of Institution of Sanitary Engineers.

Monday, April 14.—Visit of Devon and Exeter Architectural Society and South Wales Institute of Architects.

Tuesday, April 15.—10.30 a.m.: Institute of Clayworkers annual meeting. 11.30 a.m.: Meeting of the National Federation of the Building and Engineering Brick Trade. 11.30 a.m.: Meeting of Employers' National Council for the Clay Industries. 3.0 p.m.: Conference on Brick Paving. 6 p.m.: Lecture, "Old Westminster," St. Stephen's and the Painted Chamber, by Mr. Herbert A. Cox.

Wednesday, April 16.—Visit of Berks, Bucks and Oxon Architectural Society and Royal Sanitary Institute.

Thursday, April 17.—4 p.m.: "At Home" to members of the Royal Institute of British Architects, the Architectural Association, and the Society of Architects.

Saturday, April 19.—Congress and Dinner of Architects' and Surveyors' Assistants' Professional Union.

Monday, April 21.—Congress of A.S.A.P.U. continued. Visit of the Society of Estate Clerks of Works.

Tuesday, April 22.—11 a.m.: International Cement Congress. 1.30 p.m.: Luncheon to Delegates.

Thursday, April 24.—11.30 a.m.: Annual meeting of the South-Eastern Federation of the Building and Engineering Brick Trade. 4 p.m. Reception by the President and Council of the London Master Builders' Association to the members of the Association and the National Federation of Building Trades Employers. 6 p.m.: Lecture, "Westminster Hall," by Mr. Herbert A. Cox.

Popular Lectures.

The Architects' and Surveyors' Assistants' Professional Union will hold a series of popular lectures in the Lecture Hall, at 6.30 p.m. The syllabus is as follows:—

Saturday, April 12.—"The Houses We Live In," by Mr. Raymond Unwin, F.R.I.B.A., and Mr. Alfred Clifford.

Monday, April 14.—"Plays and Playhouses," by Miss Lena Ashwell.

Wednesday, April 23.—"Motor Users and the Roads," by Lord Montagu of Beaulieu and Mr. H. V. Lanchester, F.R.I.B.A.

Friday, April 25.—"The Modern School and the Future Race," by Mr. G. Topham Forrest, F.R.I.B.A.

Admission will be free.

Charing Cross Improvement.

At their next meeting, the Westminster City Council will consider a recommendation by the Works Committee for the removal of part of the island refuge between the Nelson Column and Whitehall, by the King Charles statue. The removal will become necessary when, shortly, the new building at the corner of the Mall approach and Cockspur-street is completed and the footway is set back 25 ft.

SANITATION AS WE FIND IT

By BERTRAM I. HELLYER.

rinciples and the practice of sanitation refers to plumbing and drainage have one no marked change for many years. e the custom of trapping the waste pipes aths, lavatories and sinks before entering ainage system, while allowing the soil o connect direct and to act as upcast tors, little real change has been seen. on age has steadily set in. Iron drains irther supplanted stoneware. Iron soil, and rain-water pipes have still further ed the use of lead, so that the modern r works less than ever in the beautiful ole metal that christened him.

true that during the war there was a demand for leadwork in all varieties of ss, size and shape—towers, tanks, coils, th attendant lead-burning, but this was he special purpose of war plant, and the longer exists.

mental lead work has almost ceased to be , save in the rare instances where an ct can persuade his client that his ive pleasure will compensate his extra e.

ate enterprise—if we except factories or extended for the purposes of war during the war—was as stationary as held up by a policeman's hand, and, released, resumed its former somewhat rprising course. Business premises and have been enlarged or transformed, e sanitary work this has entailed has ced no radically new features. Some s been made of the gravitation system of to cisterns in factories where many have been assembled in close proximity, nges of lavatories back to back have been ith one service pipe and one waste used ly, so that the employees shall waste as ime as possible in fulfilling certain neces- f life.

tion should be made of the greater es now demanded in factories for wash- rposes, and the insistence of drinking supplies direct from the main.

London County Council quite recently llowed within their jurisdiction the use of cast-iron soil pipes and drain vents houses, where formerly only lead pipes llowed. It is not an innovation that y experts are likely to endorse with their g, as such pipes will not last in the way ad pipes will. The majority of iron pipes, which so seldom get coated with their solution at birth as they should be, soon rust, and eventually fail to fulfil their function. It is true that a lead pipe can have a nail driven into it by a careless workman, whereas an iron pipe will point out his offence, but how many instances are recorded? It looks like another nail in the coffin of the worker in lead.

Within the last few weeks I have come across a rather curious discrepancy in views of the size of overflows; on the one hand, in some quantities for a work in the North of England, the overflows to the w.c. cisterns were specified to be ½ in. diameter; and, on the other hand, in the case of some baths for a club in London, these were specified with 2 in. overflows.

Standards of measurements have been arrived at and authorised by agreement between the Surveyors' Institution, the Quantity Surveyors' Association, the National Federation of Building Trade Employers of Great Britain and Ireland, and the Institute of Builders, and I believe these measurements for the time being are approved of also by the National Associations of Master Plumbers, Painters and Decorators, Plasterers, Slaters and Tilers. There has been considerable divergence of opinion in measuring up work, and the laying down of a uniform table of measurements will be welcome, especially to quantity surveyors, as it will no doubt save them many an argument.

The Royal Sanitary Institute has had under consideration the By-laws issued by the Ministry of Health, and the London County Council Drainage By-laws, and a special committee was appointed to go into the matter.

The Reports of this Committee were adopted by the Council and the Institute notes were transmitted to the Ministry of Health and the London County Council.

The suggestions made were not received in time to be incorporated in certain modifications made by the Ministry of Health under date of November 1, 1923, but will receive attention before the next ordinary revision of By-laws is undertaken.

The recommendations include the deletion of earth closets and privies from the urban series, and of privies from the intermediate series, and other changes and amendments intended to modernise existing By-laws and bring them into line with modern practice, and to introduce additional By-laws in regard to sanitary fittings.

I have said that there has been little or no change in the principles of sanitation in recent years, but when sanitary fittings are reviewed a wider field of view opens up, and, although there is little strikingly new in the principles again on which these are made, many more fittings are required, and manufacturers have not been lacking, while providing for this demand, in introducing variant forms of new ideas this last decade.

The housing schemes make a demand for economical fittings that shall be simple in design, and easily kept clean; and at the same time the hotels, restaurants, clubs, business premises, &c., which are putting their houses in order, or extending their accommodation, require their new sanitary fittings to be improvements on what were acceptable a few years back.

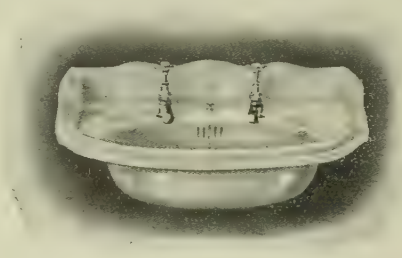

FIG. 2.

In how many of the houses of the artisan class before the war could a bath be found? Now, thanks to the Ministry of Health, it is considered as imperative that the artisan and his family should have a bath at their disposal as those that move in the "upper circles" of society. Going over some of the dwellings in a housing scheme which was carried out during the war I found that all the baths had not been devoted to their original purpose.

FIG. 3.

In this scheme the bath was placed in the kitchen, and to prevent a greater encroachment on space than was absolutely necessary, a folding table cover to it had been provided, which was secured to the wall. In folding this back in some instances the bath was found to have been appropriated as a store bin; indeed, in some cases, it had supplanted the coal cellar, and its waste was clogged up with coal dust. The generation that is growing up, however, will soon see that advantage is taken of this advance on the old order of things.

Hotels no longer can satisfy their *clientele* with a bath on each landing, and the increase in the number of bathrooms is approaching the limit of bathroom per bedroom. A few days ago, to instance the trend of the times, I received a card which proclaimed "a beautifully appointed hotel, with bedrooms with private baths and complete toilet."

The old bathroom up till quite recent years was any room with a bath in it; but now, when economy is not the first and last essential, the best kind of bath in private houses and hotels should fit into the scheme of things, and be part and parcel of the bathroom itself, as in the manner indicated in illustration No. 1.

The bath adjusts itself to the walls and floor of the room, fits into the wall scheme of marble work or tiles, or whatever is employed nowadays, instead of the sodden and pealing paper of the old days. The appearance is distinctly pleasing. With what thankfulness we miss the four legs.

FIG. 1.

Legs are to be seen in all walks of life that yield no joy in the beholding, but what compares for sheer ugliness with the legs on most of the cast-iron baths ?

The advantage does not end with the appearance. There is here no space under the bath where dust accumulates; no splashings to run down on the wall side of the bath and be neglected. Still another point in its favour is that this class of bath does not present the same difficulty for the short or medium size person to get in and out of as one with legs.

Lavatories, perhaps, lend themselves to greater variety than other sanitary fittings. They may be classed in three groups—whiteware basins set in marble tops of all colours of the rainbow; white fireclay or whiteware pedestal lavatories, as shown in illustration No. 1; and the simpler form of whiteware or white fireclay basins on cantilevers. None of these are entirely new forms in the last ten years or so, but all have been improved.

The lavatory basin shown in illustration No. 2 represents the ordinary type of inexpensive basin used some ten years ago, and indeed still being supplied. Compare it with the one shown in illustration No. 3, and mark the improvements in the latter; altogether simpler and more compact in design, with its rounded smooth contours; instead of the mouldings in the former, with an outline which could never have fitted into any scheme of wall design. How much neater the taps of No. 3, with their rounded shoulders, than those of No. 2, with their ledges, and how much more easily kept clean. No. 2 has the old slotted, more or less inaccessible, overflow, whereas this is replaced in No. 3 with a downright visible overflow inviting periodical attention easily given. Between the two lavatories illustrated no invidious comparisons are made, as they are produced from the catalogues of the same firm.

A new feature in lavatory and bathroom fittings is the introduction of a scheme of white throughout. Besides the larger fittings themselves, the taps, brackets, mirror frames, shelves, tables, towel rails, and all the other accessories and gadgets that can possibly be employed, are made in white glazed pottery, or, where metal fittings are required, these are supplied with a white finish. The idea is a sound one, but in private bathrooms personally I am still inclined to prefer nickel-plated valves and towel airers, which are easily kept clean and polished, and have a sneaking preference for glass shelves to break the somewhat drab effect of white everywhere.

A rather striking scheme consists of a range of whiteware basins set in black marble with nickel-plated valves. This would look well in a club lavatory, but would not harmonise with the white fittings and accessories in a bathroom.

There seems to be an increased demand for low level cisterns to be used with the ordinary type of pedestal w.c.'s. They reduce the noise when discharging, and are very useful when there is only a small head of water available.

An innovation traceable to American practice, where water restrictions are less arduous, is the use of a separate flushing valve in lieu of a cistern.

The valve w.c., shown in illustration No. 1, is not in so much demand because the water authorities in London consider it uses too much water, but it remains the best type of w.c. for all that. A w.c. through its soil pipe connects directly with the drain, unlike the waste from the lavatory, bath, or sink, which is not only trapped at the fitting as the w.c., but is again disconnected before entering the drain. The valve w.c., by means of the water standing in the basin, together with the trap underneath, with a ventilated valve box in between, is the best w.c. to guard against the entrance of drain air. It is the most silent, and the least likely to be fouled; the contents are the better submerged; they are entirely retained by means of the flap valve for inspection where desirable by a doctor—a point to which the late Sir Frederick Treves attached considerable importance—and are finally discharged in a "water envelope" through the soil pipe and drain.

HOT WATER SUPPLIES AND HEATING.

By A. C. MARTIN.

THE outstanding fault on many existing cylinder systems of hot water supply is that the poor little fire-back kitchen boiler is not powerful enough to satisfactorily heat the large volume of water in the cylinder. Where the two fittings are out of proportion, and it is desirable to retain the fireback boiler, it is possible to improve conditions by cutting out the primary return connection and reconnecting it at a point higher up the side of the cylinder. This often entails raising the flow connection also. As a circulation within the cylinder can only occur above the point at which the return is connected, the water below will remain cool and unaffected by the heated water above. By this means, instead of the apparatus containing at its best a large volume of luke warm water, the more limited quantity is able to attain a high temperature. There is no difficulty experienced now in making extra connections to cylinders unprovided with manholes, as there is a device on the market which is specially adapted to meet the circumstances.

It is often an economical proposition to provide a variable store of hot water for domestic purposes. For instance, at certain times of the day copious volumes of hot water are required for bathing purposes. Between such times only a very limited volume of very hot water is required for dish-washing, etc. To obtain this smaller volume of very hot water entails in the ordinary way the necessity of heating up the whole hot-store capacity. This unnecessary waste of fuel can be avoided by putting in an extra return connection, as shown at B, Fig. 1. The branch return at A is governed by a valve of fullway pattern. When it is desired that the whole volume of water in the cylinder should be heated, the valve is opened. A circulation will then occur from the boiler between the level at A and the crown of the cylinder. When the smaller volume only is needed the valve is closed. Circulation within the cylinder will then only occur between level at B and the crown of the cylinder. water is a very bad conductor of heat, volume of water below B will remain s nant and cool. The respective volumes heated water needed will be determined whatever point the extra return connectio situated on the side of the cylinder; for stance, assuming a cylinder 3 ft. high holding 60 gals. of water, and that at cer periods the whole capacity is needed and other times 20 gals. will be sufficient, return connection represented at B will made at about 2 ft. from the bottom.

Fig. 2 illustrates, in conventional form apparatus heated by two boilers and prov with double return branches. To heat up sustain the necessary temperature of a l hot store solely by gas is often not economical arrangement in comparison wi boiler which will burn coke cinders and h refuse.

When the whole capacity of the cylind needed—for instance, providing a numbe hot baths in quick succession—the valv the low-return branch is opened and boilers started. When it is inconvenien light up the large boiler the gas boiler, flow and return connections arranged at p on the cylinder as shown, will heat up water in the top portion of the cylinder out undue consumption of gas. A fu advantage given is that the water ma heated up by the solid-fuel boiler, and allowed to die out. The gas boiler will conveniently sustain the temperature to demand. To ensure this provision auto cally the gas supply should be governe an automatic control valve. A popular very satisfactory form of valve is that k as the "Thermostat." This is fixed in a point on the cylinder or in the return When the water in the return pipe bec hot—and this will only occur when the above is well heated—the gas supply is matically cut down by means of a metal alloy rod, having a high expansion contraction property. Fixed in the pipe it actuates the gas-supply valve a ing to the temperature of the water. A by-pass keeps the gas from being comp

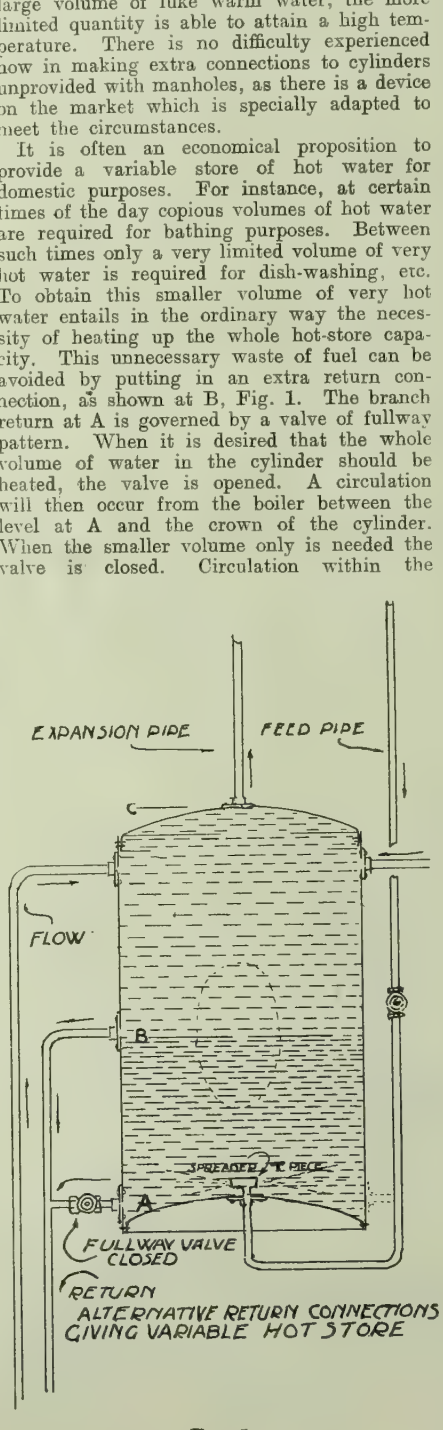

FIG. 1.

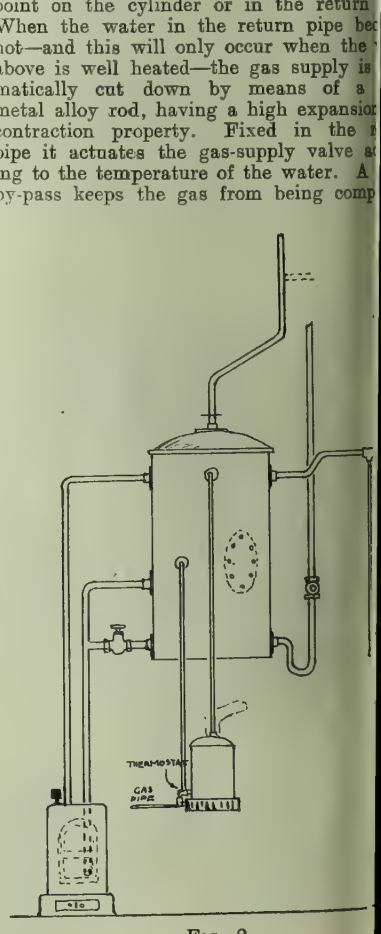

FIG. 2.

hut off, so that when, for instance, a bucket f hot water is drawn off the gas will imme-iately spring full on, owing to the influx of ool water along the return pipe on to the ncasement of the actuating rod.

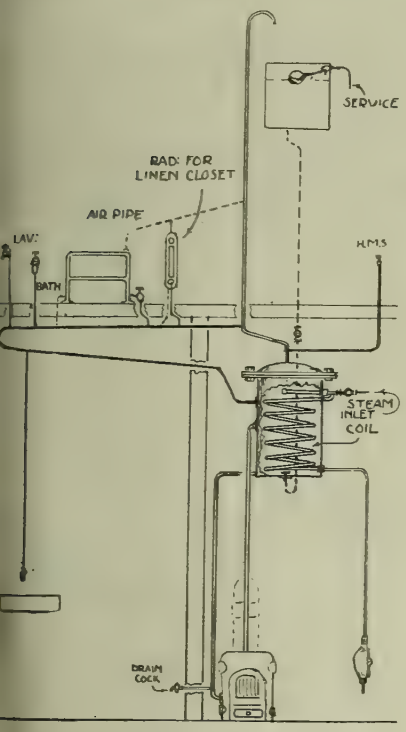

Fig. 3.

Automatic Control to Steam Heaters.

Where steam is generated on the premises r any purpose, advantage of its latent heat alues is often taken to heat up water for omestic or other supplies. The economical ay of effecting this is by blowing the steam irectly into the water. As this procedure accompanied by noises similar to that of battery of machine-guns at work, such a ethod is only employed in slaughterhouses nd factories, where the noise will be no bjection when balanced with the saving in st. The essential factors needed ordinarily re: A constant supply in steam at a good orking pressure; a copper coil or box within jacket, such coil or box to present sufficient rface to raise the water surrounding it to temperature high enough for the require-ents of the establishment; a steam trap to tomatically discharge the condensed steam

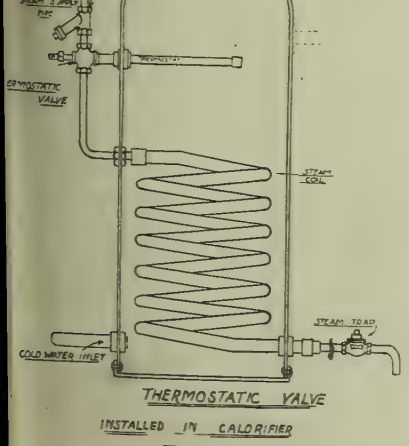

Fig. 4.

to some convenient point. Fig. 3 shows a calorifier fixed to supply hot water to a group of sanitary fittings. A boiler is shown in addition, to heat up the water in the event of the steam being cut off. With a constant supply of live steam at a good working pressure this boiler would be unnecessary. To

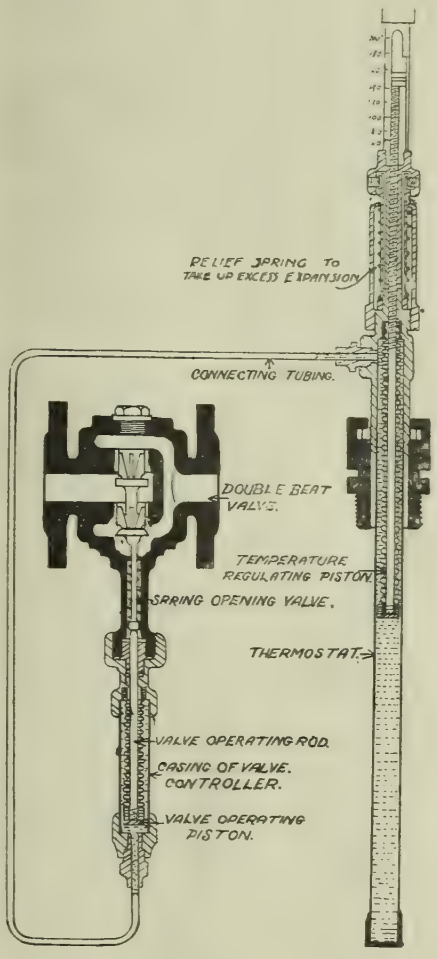

Fig. 5.

prevent overheating and consequent loss of steam the supply is controlled by an automatic valve, which is regulated to cut off the steam when the water in the calorifier is at the required temperature. Steam passes in this case through a copper coil. The steam trap is necessary with all such fittings to automatically discharge the condensed steam and at the same time prevent the escape of live steam. The greater the difference between the temperature of the water surround and the steam within the coil, the more rapid will be the rate of condensation. Where a number of these traps are used it is often convenient to gather the water in a pipe and lead it back to the generating boiler. The advantage of this method is that the water, being hot, it will not take so much fuel to reconvert it to steam in comparison to water direct from the cold service. If a cast-iron radiator, as shown, is fixed on a hot-

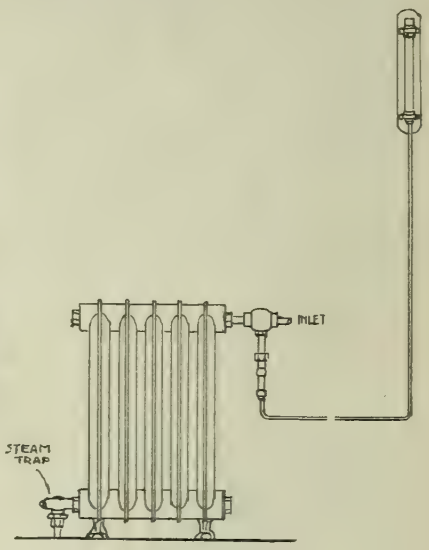

Fig. 6.

supply service to heat a linen store, it should be treated by the "Bower Barrff" process, to prevent rusting of the internal surfaces. This is necessary whether the water is "hard" or "soft." If hard, the lime is precipitated before it gets to the radiator, so that it becomes virtually a soft water. This is a point often lost sight of in hot-water work. The chief objection to the rusting is in the fact that the water drawn off at the taps will be red, and objectionable for all domestic and other purposes. Fig. 4 gives an enlarged sectional view of a similar calorifier fitted with the thermostatic valve; the section of this valve is somewhat similar in construction to that of the following figure. The piston which closes and opens the valve is actuated by a sensitive liquid contained in the sealed tube; where movement is required to smaller fluctuations of temperature the type shown in Fig. 5 is recommended. The section as drawn should be self-explanatory.

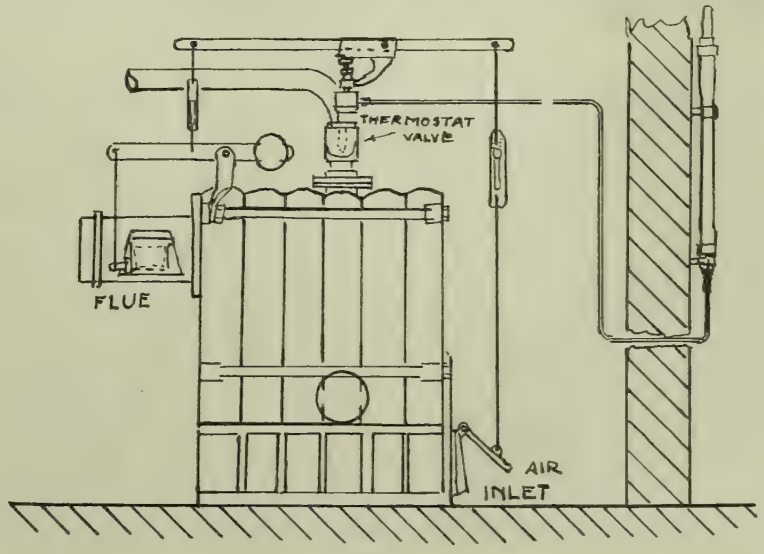

Fig. 7.

The type is used for screwing into a calorifier "known as the liquid type." Another form, "room type," will actuate a valve on a radiator or damper of a boiler by the fluctuations of the temperature of a room or on the external atmosphere. Automatic damper regulation has previously been contrived to shut down at certain boiler temperatures irrespective of outdoor temperature. This method is not ideal when the large fluctuations of temperature, even in this country, is considered. For ideal conditions the temperature of the water in a boiler applied to heating of rooms, and for various drying purposes in factories, should increase with a falling external temperature, and *vice versa*.

This fitting is designed to meet the need automatically. The application is shown in the two following figures. Fig. 6 shows the appliance fitted to regulate the temperature of a single radiator on the temperature of the room in which the thermostat is situated. Fig. 7 shows a similar device fitted on the external face of wall to regulate the dampers on a boiler. The fitting may be applied to the regulation of gas supply, steam, hot

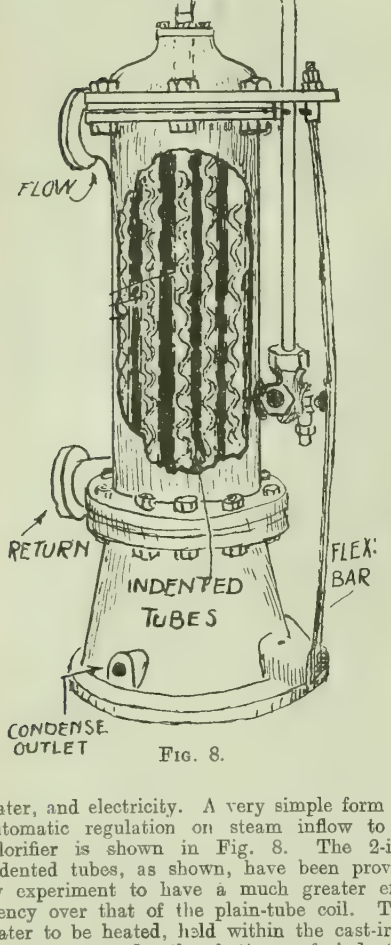

Fig. 8.

water, and electricity. A very simple form of automatic regulation on steam inflow to a calorifier is shown in Fig. 8. The 2-in. indented tubes, as shown, have been proved by experiment to have a much greater efficiency over that of the plain-tube coil. The water to be heated, held within the cast-iron jacket, surrounds the battery of indented tubes. When the steam is turned on this water is quickly heated. The small linear extension of the heated jacket, due to expansion, is sufficient to give appreciable movement to the flexible steel bar connected to the extreme points, to automatically close the steam inlet valve when the desired temperature of the water is attained.

The No. 1 size, standing 3 ft. 6 in. high, will heat up 100 gals. of water per hour from 50° F. to 180° F. with steam pressure at 50 lb. per square inch. This is equivalent to (180 − 50) × (100 × 10) = 130.000 B.T.U. The calorifier may be applied to the heating up of large volumes of water for domestic or other purposes.

MACHINERY AT THE BUILDERS' EXHIBITION

By STAFFORD RANSOME.

The Builders' Exhibition, which opens to the public at Olympia to-day (Friday) and will continue until the 26th inst., promises to be an unusually interesting one, especially as far as the machinery section is concerned. The fact that there has been a gap of two years, since the series of three annual exhibitions terminated in 1922, has allowed more scope for appreciable improvements in designs than is the case when an exhibition is held every year. This particular two years has been what may truly be described as a period of recuperation in the engineering world, a terribly slack time which followed an abnormal post-war rush when the firms concerned had but little time to think of new designs or of anything but getting the work out. During these last two years, however, our manufacturers have been putting their houses in order, have definitely formulated their respective permanent policies and, above all, have realised what they are "up against" in the way of competition at home and abroad. The net result has been that very great and in some cases drastic improvements have taken place in the designs of builders' machinery during the two years in question, and these are very clearly demonstrated at the present show.

Although the Builders' Exhibition is especially an all-round display of builders' requirements generally, we find in each succeeding exhibition a growing preponderance of mechanical exhibits, especially if we reckon them by the amount of space occupied by this class of product. These mechanical exhibits may be divided into two distinct categories, viz., those which are used by the builder himself to assist him in the preparation and erection of his materials and the carrying on of his work generally, and those which form part of the installations which he is erecting, such as ventilating and heating plant, pumping and lighting installations, and so forth.

Although many of these latter are intensely interesting and this class of exhibit is well represented, it is not my purpose in this article to deal with them. I propose merely to consider the former, *i.e.*, the builders' machinery proper. Of these machines, wood-working machinery naturally preponderates in a very marked manner. This in a general way is mainly due to the fact that the manufacturers of wood-working machines, who have no periodical exhibitions of their own, have seized upon the Builders' Exhibition, much as the manufacturers of agricultural machinery have seized upon the annual Cattle Show, as the natural opportunity for displaying their wares to a public which is mainly composed of potential customers.

There may be another reason why in this respect there is a larger quantity of machinery than in the past, and this is that nearly all the firms concerned have decided to refrain from showing at the Empire Exhibition. However this may be, there are at least one hundred and sixty wood-working machines shown by about twenty firms, of whom some fifteen are British and the remainder mainly Belgian and French makers, while there are a few American machines.

If we except log-sawing machines and the very heaviest types of planing machines, and, of course, those many special machines for which the ordinary builder has no use, it would not be unfair to say that this particular exhibition affords perhaps the most complete and varied selection of ordinary general-purpose builders' machinery that has been seen for a long time. And this in spite of the fact that there are several absentees in the way of notable makers whom one might have expected to be showing.

Although log-sawing machines are, with one exception, conspicuous by their absence, modern high-speed re-saws of both British and foreign construction are well represented. These are all of the band or circular-saw variety, mainly the former; and it is a sign of the times and a tribute to the growing ascendancy of the band-saw for this class of work, that there is no such thing as a deal frame among the exhibits. This may be partly because a frame-saw is a cumbersome machine to fix and demonstrate in an exhibition which only lasts a fortnight, or because it may be thought to be too well known to need demonstration; but its total absence seems to point to the suggestion that it is no longer regarded, as was the case in the past, as one of the most essential of machines for the builder who was large enough to require much re-sawing.

There is a great variety of saw benches for all sorts of work, many of which possess new features. There are dimension and roller and sliding-table and chain-feed saws, and in the designs of some of them it will be noticeable that American practice has had some influence, while in other cases it is equally unmistakable that recent Home Office regulations for protecting the blades have affected their construction.

Planing machines are in great variety, from the latest high-speed 4- or 6-cutter planers and moulders down to all types of surfacing and thicknessing machines and combinations of the two. It is particularly in the thicknessing and hand-feed surfacers that the great variety of makers who are directly competing becomes apparent, and one wonders, if all these firms are kept busy on such machines where in the world there can be a market for them. In this respect the planers are surpassed only by the chain mortiser, samples of which will be met with at every turn in this exhibition. There are at least ten firms who are exhibiting one or more of these.

Tenoning, boring, housing, dovetailing, and sand-papering machines, and vertical spindle moulders and lathes are also shown, and among the novelties will be demonstrated certain adaptations of the flexible drive to portable or movable wood-working tools. Small planers and saws and lathes, which can be readily fixed to, and as readily removed from, a bench, and each self-contained with its own electric motor, are an interesting feature, as also machines for truing up and polishing fixed flooring.

General joiners are less numerous than on previous occasions, being represented by only three samples. This seems to confirm a contention recently expressed in these columns to the effect that since electricity has simplified the driving of separate machines there is less demand for the combined machine.

There are the usual assortment of safety appliances and sharpening machines, and two of the most striking features are the developments in electrical driving and the progress that has been made in the manufacture and utilisation of thin high-speed steel cutters.

Prominent among the builders' plant, apart from wood-working tools, are many varieties of concrete plant, including mixers and distributors, and brick, slab and tile-making machines, paint and other pigment grinders, mixers and distributors, stone crushers, derrick and other cranes, hoists, winches, trucks, run-ways, tipping skips, oil engines, and pumps of various sorts.

There are also stone and marble-working machines for sawing by gravity, and other saws, cross-cutting and polishing, and all sorts of saws especially destined to be used on metals. A new and rapid air-acetylene process for removing paint is shown, and a very large assortment of every conceivable builder's tool, including those to facilitate the process of paper-hanging. New methods and appliances for the erection of scaffolding is another feature, and there are a great variety of lifting and other tackle, blocks, wrenches, bar benders, etc.

Sewage plant is also seen: septic tanks, distributors, water-softeners and filters, and machines for cleaning drains and other tubes and pipes, and for smoke testing, and systems for applying lime washes and distempers by the spraying process.

The Builders Exhibition is essentially a business function, lasting a fortnight and possessing no extraneous attractions to bring the idler or the sightseer. Nor has it the fascination for the general public that is possessed by the motor show or the electrical exhibition in these days when everybody is a potential motorist, and everybody likes to think himself his own electrician. Its appeal, however, which, of course, is primarily to the builder and the architect, should extend far beyond that industry and that profession, for there is much in it to attract the engineer, the doctor, the sanitary authority and the exporter. Besides all these, however, any intelligent householder who likes to gain an insight as to the brain power required and the resultant appliances for building and decorating the house he lives in will find an immense amount to interest him in the Exhibition.

THE STANDS.

Below we give a further list of the exhibitors at the Exhibition together with particulars of what is being shown on the different stands.

Acme Patent Ladder Co. (Earlsfield, London.) **Stand No. 173, Row J.**

Ladders.—This firm has on exhibition a large variety of their patent telescopic extension ladders to extend by ropes, pulleys and patent springless automatic locks. "Guildhall" pattern scaffold trestles are also shown.

The Adamite Company, Ltd. (Regent House, Regent-street, London, W. 1). **Stand No. 98, Row E.**

Cement.—The Adamite Company, Ltd., are showing "Atlas White" portland cement and "Colemanoid" ("Colemanite"). The principal exhibit on Mr. Coleman's stand is "The Spirit of the Rocks," a statue executed in white cast concrete stone, the sculptor being Mr. F. Doyle Jones. The aggregate employed with the "Atlas White" portland cement to produce this cast-stone is Cornish granite, the cement being brushed off the surface to expose the aggregate. The production of the stone in which "The Spirit of the Rocks" is cast is in the hands of Messrs. Emerson & Norris, Ltd. Beside "The Spirit of the Rocks" Mr. Coleman is showing a doorway in a manner of the Tudor period, suitable for domestic buildings. This doorway is also carried out in cast concrete stone by Messrs. Emerson & Norris, Ltd. In America, many buildings have been erected in cast concrete stone, some of which, it is claimed, are as beautiful as stone work centuries old. The cast stone in the doorway, which is shown on the Adamite Company's stand, is manufactured from "Atlas White" portland cement and selected aggregate carefully graded. The doorway is so arranged that it will illustrate both exterior and interior finishes. Many other examples of the use of "Colemanoid" and "Atlas White" portland cement, in various lines of interest to architects and contractors, are shown, as well as a comprehensive exhibition of British aggregates.

Adams, Robert (Holborn, London, W.C.1). **Stand No. 58, Row D.**

Engineering Specialities.—This exhibit includes working models of the patent "Victor" door spring hinges, Robert Adams' patent fanlight openers and ventilating gearing, "Victor" universal system of reversible fittings, &c.

Alabastine Co. (British), Ltd. (Church-street, South Lambeth, London, S.W.). **Stand No. 138, Row G.**

Paint.—Here are shown examples of Church's Alabastine, a dry powder ready for use in cold water. It is a cement which forms permanent coats, admits of recoating from time to time without removing old coats, and hardens with age. Examples of "Jelstone" distemper in numerous distinctive colours are also shown. Both products are made in England entirely from material produced in the United Kingdom, and are the production of British labour.

Alexander, Herbert & Co., Ltd., (Charmouth-street, Leeds). **Stand No. 221, Row L.**

Brick Machinery.—This firm is exhibiting some of their brick-making machinery, together with various samples of bricks produced on such machinery. Amongst the exhibits will be sand-lime bricks, magnesite refractory bricks, also bricks made on the stiff plastic process from shale, and on the plastic wire-cut process from plastic clays.

Allen-Liversidge, Ltd. (106, Victoria-Street, London, S.W.1). **Stand No. 292. Row Q**

Acetylene.—The purposes to which the various combinations of acetylene can be put are explained on this stand. The building and contracting trades incorporate the practice of many branches of engineering work, and, although some of them are vastly diverse in character, nearly all of them have this in common—that, either as a prime factor or as an auxiliary, they find a use for acetylene in the various operations which their requirements demand. For use on a large scale dissolved acetylene is especially recommended. A portable plant is essential; oxy-dissolved acetylene cutting equipment is extremely portable. Dissolved acetylene cylinders supplied for metal-cutting purposes range from those containing 50 cubic ft. of acetylene upwards. The 50 cubic ft. cylinder is very convenient for short period intermittent work on account of its lighter weight (some 40 lbs. only). The use of A-L "Imperial Lights" and A-L "Da-Lights by builders and contractors eliminates the trouble and expense, it is claimed, involved by the temporary erection on the site of the work of electrical plant and the necessary complicated wiring systems.

Art Metal Equipment Co., Ltd. (184–188, Shaftesbury-avenue, London, W.C.2.) **Stand No. 108, Row. F.**

Metal Equipment.—The Art Metal Equipment Co.'s exhibit consists of shutters of rolling steel doors made of interlocking steel slats, the working parts being fitted with ball bearings to ensure ease of operation. Despite the prosaic utility of the shutters they are in nowise an eyesore, and the harmony and beauty in a building, it is claimed, are not in the least destroyed by the intrusion of these necessary aids to safety.

The Bath Arteraft, Ltd. (111, Oxford-street, London, W.). **Stand No. 162. Row H.**

Carving.—The exhibits of the Bath Arteraft, Ltd., are contained in a stand of simple architectural outline, but with a certain freshness in design and character. Part of it comprises a portion of a dining-room panelled in oak with Grinling Gibbons' style of carvings in lime-tree. Another portion represents part of a room panelled in mahogany. One end of the stand is fitted with a bay window and at the sides are displayed a series of hardwood doors in oak, walnut, teak, &c., some of these are flush doors suitable for office and hospital use; others are framed, panelled and moulded. Some recesses are fitted with wood mantelpieces and with various styles of wood panelling. Part of the floor is laid in oak and parquetry, and part covered with Velvuto rubber flooring; a new special floor material produced by an associated firm, the Bath Rubber Mills, Ltd., Norfolk Works, Bath.

Batsford, B. T., Ltd. (94, High Holborn, W.C.1). **Stand No. 86. Row E.**

Books.—Messrs. Batsford's stand contains a full range of their publications for architects, surveyors, builders, interior decorators and craftsmen. Prominent among the works shown are: Mr. Gotch's "Architecture of the Renaissance in England"; Sir Banister Fletcher's "History of Architecture" and text-books on professional practice; Professor Richardson's "Monumental Classic Architecture" and "London Houses"; Mr. Aymer Vallance's "Old Colleges of Oxford"; Mr. Crossley's "English Church Woodwork" and "Church Monuments"; Mr. Stratton's "English Interiors"; Mr. Statham's "Critical History of Architecture"; Miss Jourdain's "English Interiors from Smaller Houses, 1660–1800"; Mr. Godfrey's "Architectural Guide to London"; Mr. Yerbury's "Studies of the Human Figure"; Mr. Gordon Allen's "Cheap Cottage and Small House"; Mr. Ellis's "Modern Practical Carpentry and Joinery"; Mr. Mitchell's "Building Construction"; Mr. E. H. Blake's "Drainage and Sanitation"; Mr. Rea's "How to Estimate."

The Birnwell Iron Company, Ltd. (British Columbia House, 1, Regent Street, London, S.W.1). **Stand No. 14, Row B.**

Ironwork.—The Birnwell Iron Co., Ltd., are exhibiting on their stand specimens of the "Birnwell" hot-water boiler and stove. A marked feature of the stove, it is claimed, is its easy accessibility. Also a special damper is so placed that the maximum of heat gases encircles the underside of the hob, providing a highly efficient hot-plate and perfect control. Another distinct advantage is that owing to the special design of the ash-pit ashes fall directly into the pan and nowhere else. This saves excessive dust in the room, and the ashpan is so designed that the ashes can be emptied without even turning the ashpan over. It has been designed to combine the maximum efficiency with perfect combustion. Apart from these advantages which the makers state the "Birnwell" alone possesses, the finish and workmanship throughout make it attractive in appearance and satisfactory in service.

Briggs, William, & Sons, Ltd. (5, Cowgate, Dundee). **Stand No. 34, Row C.**

Bitumen.—Messrs. William Briggs & Sons, Ltd., Dundee and London, make a special display of their natural bitumen damp-courses and roofing felts. Models and specimens illustrating their "Challenge" composite roofing system are also on view. The system consists of laying either two or three layers of Briggs' "Challenge" roofing, either direct to wood boarding or concrete, on flat and slightly pitched roofs. On wood roofs the first layer is nailed to the boarding, whilst on concrete it is securely bonded to the surface by means of "Challenge" bitumen applied hot; each succeeding layer of roofing is firmly bonded and hermetically sealed to the preceding layer by means of "Challenge" bitumen applied hot, and the finished job is an extremely durable roof covering, having, it is claimed, all the advantages of the much more expensive systems at less cost. A feature will also be made of Briggs' "Utex" roofing.

"The Builder, Limited," has two stands, namely, **Stand No. 126, Row F,** where there are reception rooms; a display of books of interest to the architectural, building and allied professions; models of "Old London Bridge," "Old St. Paul's," "Mill Lock" (the recently discovered second arch of Old London Bridge), "Old Westminster," and models of houses with three and four bedrooms made from the winning designs in *The Builder* Cost of Building Competition; news, lectures and music by wireless; and architectural illustrations displayed by means of a new type of electric optical lantern. The other **Stand, No. 245a, Row N,** is for the sale of *The Builder* only and for general information.

Builders & Contractors Plant, Ltd. (51, Tothill-street, London, S.W.1). **Stands No. 250, 251, Row N; Stand No. 261, Row O.**

Machinery.—Messrs. Builders & Contractors Plant, Ltd., show "Exe" Hoist No. 1 and No. 2, and a recent development of the "Exe" Hoist No. 1, consisting of a concrete tipping

carriage with silos, swivel elbow joints and chuting for using the "Exe" hoist as a concrete-pouring plant. Another "Exe" development was too big to come in Olympia; this consisted of the "Exe" concrete-placing plant. Actually on the Stand are illustrations of these machines at work in different parts of the country, and the power unit—a 10 h.p. "Climax" semi-Diesel engine, a highly efficient low h.p. low grade oil consumption engine capable of working at about 2½d. per hour. Everything in hoisting is represented, as besides the "Exe" and the "Exe" hoist crane, two small and handy hand-derricks for barrow hoisting, and a range of chain and self-sustaining "Monarch" rope hoists, as well as an overhead runway are displayed. The "Roll" concrete mixer is represented, and other interesting exhibits are the "Ama" concrete block machine; and a useful auxiliary in the "Rapid" slab machine.

Cakebread, Robey & Co., Ltd. (High-road, Wood Green, N. 22). **Stand No. 51, Row C, and Stand No. 209, Row K.**

Ironmongery.—Messrs. Cakebread, Robey & Co., Ltd., are exhibiting their latest exclusive designs of wood chimney pieces and tiled fireplaces, including their "Caroba" hearth fires; also a special display of sanitary goods, including white porcelain enamelled baths, lavatory basins, pedestal closet suites, and bath-room fittings, &c.

Callender, George M., & Co., Ltd. (25, Victoria-street, Westminster, S.W.1). **Stand No. 67, Row D.**

Bitumen Products.—This stand is demonstrating the following products: "Callendrite" sheeting, a waterproofing medium for open and covered service and storage reservoirs, filter beds, swimming baths, lakes, ponds, &c.; "Callendrite" dampcourse, for foundations; "Ledkore" dampcourse, composed of a core of sheet lead with a special bitumen covering both sides, containing no coal tar or pitch, and suitable for all climates and purposes; "Protex," for keeping walls dry; "Bitusol" paint for iron and steel work of all descriptions, claimed to be an absolute preventative of rust; "Veribest" ready roofing, a self-finished roofing material prepared from pure refined bitumen in 1, 2, and 3-ply; "Bitufelt" roofing, a bitumen roofing felt supplied in rolls 36 ft. long by 3 ft. wide; "Rooferite" plain finish bitumen felts for roofing, sarking and lining purposes, in rolls 15 yds. long by 1 yd. wide; "Bituline" insulating paper, a bitumenised tough heavy paper for use in cold storage and building work; "Bitubond" building composition, which, when poured hot into cavities formed by two brick or stone walls, fills every interstice in the inner wall faces, rendering the wall impervious, non-conducting, sound and temperature proof; and "Plastaleke" asbestic-bitumen cement, for the rapid and easy repair of leaky roofs of all kinds.

Camp & Co., Ltd. (41B, Blenheim-crescent, Ladbroke-grove, London, W. 11). **Stand No. 276, Row P.**

Sash Chains.—This firm is exhibiting the "Sollink" sash chain, which is being shown for the first time at the exhibition. The "P.C." metal shears are also being shown for the first time.

Cardon & Co., Ltd. (Chespale Works, Penshurst Station, Kent). **Stand No. 54, Row C.**

Fencing.—This firm exhibit examples of "Chespale" fencing.

Collier, S. & E., Ltd. (Grovelands, Reading). **Stand No. 59, Row D.**

Bricks.—The exhibit of this firm takes the form of a pavilion, which occupies a site 20 ft. × 10 ft. exposed on three sides, and is rectangular on plan, designed as a garden house or tea room, with double recessed semi-circular arch and splayed jambs, and tile imposts forming entrance, with a pair of painted transparent green doors at one end, and at each side a semi-headed window flanked by lead glazed and bright red brick bull's-eye windows.

Concrete Utilities Bureau (35, Great St. Helens, E.C.3). **Stand No. 115, Row F.**

Information on Concrete.—The Concrete Utilities Bureau, an organisation for encouraging and advocating the use of concrete, is represented. All who are interested in concrete for any purpose and who may have any points upon which they wish enlightenment are invited to seek the assistance of the Bureau free of charge. Publicity literature on the manifold uses of concrete may be obtained.

Cooksley, A. (21–25, Tabernacle-street, London, E.C.2). **Stand No. 88, Row E.**

Woodworking Machines.—On this stand are shown woodworking machines of various types and patterns.

Crittall Manufacturing Co., Ltd. (246, High Holborn, W.C.1). **Stand No. 153, Row G.**

Metal Windows.—Metal windows of every description are shown. Amongst the novelties is the new "Zincspra" process, which is applied to metal windows to make them rust-proof. Another novelty will be a special new range of standard windows produced for use in tropical countries, and a new type of hospital window. Architectural bronzework and a range of various standard metal windows and doors are included in the exhibit.

Davis Gas Stove Co., Ltd. (60, Oxford-street, London, W. 1). **Stand No. 154, Row H.**

Gas Stoves.—This firm display many examples of their manufactures, including (1) "Rubston" gas fire-places; (2) "Nautilus" gas flue blocks; (3) improved "Nautilus" coal grates; (4) "Alpine Extended" gas range; (5) "Garba" portable gas heater; and (6) "Rose" and "New Shamrock" geysers.

Dawson & Co., Ltd. (York-road, Battersea). **Stand No. 277, Row P.**

Sanitary.—The exhibit includes: Sanitary Section: A large selection of white enamelled and "Ephos" brownware drainage channels, Dawson & Co.'s improved stable gully, Mendip gully, and anti-back flow gully; also the "Lixall" interceptor with access eye and chamber combined. Brick Section: A large selection of samples, comprising Kent stocks of various qualities.

Dominion Machinery Co., Ltd. (Union-street South, Halifax). **Stand No. 75, Row D.**

Woodworking Machinery.—The Dominion Machinery Co., Ltd., show some of their woodworking machines and exhibit for the first time their "Super Elliot" woodworker (patented).

Drew, Clark & Co. (Diamond Patent Ladder Works, Leyton, E.10). **Stand No. 204, Row K.**

Ladders.—On this stand are shown Drew's patent telescopic ladders, in two, three and four sections, and from 9 to 90 ft.; Drew's patent decorator's ladders, platform steps, scaffold trestles, tower ladders, and Higgs' and Drew's patent "Raprig" sectional scaffold. The last-named is for interior decoration, and combines lightness with great strength. It is simple to erect, and is claimed to be the ideal scaffold for interior decoration of institutions, clubs, hospitals, theatres, cinemas, public buildings and business houses.

Drytone, Ltd. (73, Gower-street, W.C. 1). **Stand No. 61, Row D.**

Woodwork.—The exhibit comprises "Drytone" doors. They are stocked in three materials, British Columbia pine, Western hemlock, and red cedar; and in two sizes, namely, 6 ft. 4 in. × 2 ft. 4 in., and 6 ft. 4 in. × 2 ft. 8 in. Also a selection of "Drytone" panelling and "Drytone" furniture is shown.

Evans & Ronald, Ltd. (7, Denman-street, London, S.E.1). **Stand No. 23, Row B.**

Fittings.—On this stand are shown: (1) The "Evron" patent bullet catch and bolt combined, in which there is no necessity for a lock and key when using the bolt; (2) the "Eddoll" patent gate latch, which ensures a gate being shut; (3) the "Cubitt" patent electric light bulb director, which may be easily fitted to the flex and enables the light to be thrown at any angle and in any direction; and (4) the "Riddick" patent door furniture, which is easily fitted and does not require screws.

Freeman, Joseph, Sons, & Co., Ltd. (Wandsworth, S.W. 18). **Stand No. 312, Row R.**

"Cementone."—This exhibit indicates the possibilities of decorative work in cement, concrete, plaster, roughcast, &c., by the use of Freeman's "Cementone" products for colouring and glazing these materials by incorporation and surface application. Examples are shown in panels of roughcast, tinted in various shades, by the incorporation of No. 1 "Cementone"; coloured concrete scullery and kitchen floors, wall dados, steps, garden paths, rockeries, tiles, &c., down to buttons, are illustrated in permanent colours. Variegated designs, resembling marbles and granites, mosaics and composition flooring, are also shown. Freeman's No. 7 "Cementone" coloured glazes, No. 4 "Cementone" waterproofing liquids, and No. 8 "Cementone" liquid concrete hardener are exhibited.

Gawthorp & Sons, Ltd. (4, Trafalgar-square, London, W.C.2). **Stand No. 270, Row P.**

Metalwork.—An exhibition of wrought-iron work for domestic and ecclesiastical use, "Culu" brass, alabaster and marble memorials, repoussé copper fittings, stained glass and oak panelling, and general fittings.

Haigh (Oldham), Ltd. (Globe Iron Works, Oldham). **Stand No. 208, Row K.**

Woodworking Machinery.—This firm is showing: Rising table saw bench, single-spindle dimension saw bench, high-speed tenoning machine, fret-sawing machine, surface planer, panel planer and thicknessing machine, combined over-and-under planer, three- and four-cutter planer, chain-mortising machine, universal woodworker, automatic dovetailing machine, vertical spindle moulder, band-sawing machine, and grinding machines.

Haigh, Wilson & Co. (50, Grey-street, Newcastle-on-Tyne). **Stand No. 7, Row B.**

Steel Frames.—A feature is a standard steel frame, 21 ft. span, supplied in any desired length, or for erecting two or more bays abreast.

Haunchwood Brick & Tile Co., Ltd. (Nuneaton). **Stand No. 62, Row D.**

Bricks.—This firm is exhibiting samples of their manufactures, including numerous kinds of blue and brindle bricks, including 3 in. pressed blue bricks without frog for L.C.C. sewer contracts, pressed blue bricks with frog 2⅝ in. or 3 in. thick, blue stable and path pavers, blue kerbings and channellings, blue platform and wall copes, garden edging, red, blue, buff and salt-glazed ventilating bricks, red and blue flooring quarries, red, blue and buff ridges and finials, red, blue, buff and salt-glazed chimney pots, firebricks and fire-quarries, sanitary pipes and connections, garden vases, land drain pipes, hollow blocks, sand-faced fireplace bricks, &c.

Hooley Hill Rubber & Chemical Co. (Audenshaw, near Manchester). **Stand No. 37 Row C.**

Rubber.—Exhibited on this stand are varieties, shades and thicknesses of rubber flooring and tiling, &c.

Hopton-Wood Stone Firms, Ltd. (Wirksworth, Derbyshire). **Stand No. 246, Row N.**

Stone.—This stand has been carried out completely in stone to demonstrate the uses of the products of the firm.

Hurry" Water Heater Co. (39, Broad-street, Birmingham). **Stand 199, Row K.**

Water Heaters.—This firm is showing heir ordinary designs of water heaters which re of the storage method, and rather differ om the ordinary geyser, as the latter is not of ne storage. "Hurry" geysers for small pro-erty are also shown, and a special show s made of "Hurry" furnaces or coppers, hich are a special design for delivering hot ater to a bath, and also for washing clothes, milar to the ordinary furnace.

nteroven Stove Co., Ltd. (156, Charing Cross-road, London, W.C.2). **Stand No. 210, Row K; Stand No. 233, Row L.**

Stoves.—The Interoven Stove Co., Ltd., ow both the "Interoven" and "Super-nteroven" convertible cooking and heating oves (Pascall's Patents), for cooking all eals, baking bread and pastry, and giving mple supply of hot water for baths and domestic rposes and a comfortable fire all day. They re instantly convertible from cooking stove open fire sitting-room grate, and save coal, ace and labour. The "Bewty" expanding rless fire fronts (Pascall's Patent), for modern-ing old-fashioned sitting and bedroom grates a small cost; and the "Bewty Minor" and Bewty" dog grates are shown, together ith the "Ten-in-One" adjustable stool bottom ates (Pascall's Patent), and the wrought elded range boilers of every description.

ohnson's Reinforced Concrete Engineering Co., Ltd. (23, Leadenhall-street, E.C. 4). **Stand No. 146, Row G.**

Concrete.—This firm display the following ecialities of concrete reinforcements: Lattice: his mesh reinforcement has been designed and manufactured exclusively for concrete floors, ofs, walls, roads, culverts, tanks, and similar nstructions. It provides for a completed ticle ready for laying in concrete, reducing e labour charges and risk of displacement to minimum. "Keedon" fitments used in njunction with ordinary round mild steel rs for concrete beams, columns, &c., have oved to be both efficient and economical, d, in application, have the advantage of mbining rigid and yet adjustable members ith a non-slipping bar. "Bricktor," it is imed, is the reinforcement for all kinds of ick-work, partition slabs, concrete block ork, &c., where extra strength and lightness construction are required.

ennedy, W. (Station Works, Warwick-road, West Drayton, Middlesex). **Stand No. 52, Row C.**

Bar Bending Machines.—On this stand is own a series of bar-bending machines r cold-bending tubes or rods of various sections special feature is made of the No. 2 achine, designed for bending bars up to 1 in. diameter, and particularly suitable for inforcement for concrete.

tham, James Ltd. (124, Curtain-road, London, E.C.2). **Stand No. 149, Row G; Stand No. 158, Row H.**

Timber.—Messrs. James Latham, Ltd., show amples from each of their principal de-rtments. The Hardwood Department has magnificent pile of Austrian and Volhynian inscot oak, as well as plain and figured k, walnut and mahogany, &c., one log of hogany being over 60 ins. wide. The ulding Department exhibit specimens of pfitters' and joiners' mouldings, as well as dwood floorings and matchings. Plywood every description for panelling, as well as h-class veneers are shown in great variety, l as usual many samples from high-class stocks figured hardwoods are shown in the rough nanufactured into panels.

khampton Quarries Co., Ltd. (Sandy-lane, Charlton Kings, near Cheltenham). **Stand No. 32, Row C.**

tone and Slate.—This stand takes the form a small pavilion built of Cotswold stone and roofed with Eyeford slates with Cotswold stone ridging. The floor of the stand has been paved with slabs of indurated "Trigonia" (a new artificial stone), and there is also a display of limestone of all grades.

Liner Concrete Machinery Co., (Newcastle-on-Tyne). **Stand No. 283, Row P.**

Concrete Machinery.—A number of concrete machines are demonstrated, including the "A" Type No. 1 slab-making machine, complete with a patent elevator bogie, capable of elevating the required load to 4 ft. 6 in.

The Liverpool Adhesive Paste Co., Ltd. Stand No. 302, Row R.

Paste.—At this stand is shown a complete range of the L.A.P. products for decorators.

Major & Co., Ltd. (London, S.E. 1). **Stand No. 110, Row F.**

Wood Preservative.—Messrs. Major & Co., Ltd., manufacturers of "Solignum" wood preservative, are exhibiting a two-room wooden building and fencing, illustrating the uses of their preparation as a preservative, as well as a decorative agent for external woodwork, and as a decorative stain for interiors.

Mechanical Engineering Co. (Manchester), Ltd. Stand No. 81, Row D.

Woodworking Machinery.—This firm is exhibiting the following woodworking machines: 32 in. roller feed saw bench; "Diploma" spindle moulder; power mortising machine; 18 in. pedestal saw bench; 12 in. bench planer; 26 in. "Reliant" saw bench; 30 in. band saw; hand mortiser; 30 in. ball-bearing saw bench; 24 in. × 9 in. panel planing and thicknessing machine; combined 20 in. × 9 in. under and over machine; 30 in. pendulum cross-cut; and a spindle moulder, with 30 in. tables.

Naylor Brothers (London), Ltd. (Slough, Bucks). **Stand No. 166, Row H.**

Paint.—This stand shows four rooms, the walls, doors and woodwork showing the finish which is obtained with the products. Other specimens of materials and work are shown. The pillars on the stand are finished with "Petrumite" imitation stone paint; the drawing room and bedroom in distemper with a stencilled frieze; the dining-room has oak panels finished with encaustic copal varnish, giving a flat finish; the bathroom is papered and the paper varnished with "Suwidec" varnish; the doors and woodwork in the various rooms are finished with "Suwena" enamel, "S.E.G." paint, and "One Coat Oak" and "Suwidec" varnishes.

Nettlefold & Sons, Ltd. (54, High Holborn, W.C.1). **Stand No. 111, Row F.**

Ironmongery.—Messrs. Nettlefold & Sons, Ltd., exhibit, in addition to a wide range of locks, hinges, and door furniture, a number of patterns specially suitable for housing schemes and several new lines in door and window fittings. In the lock section is shown a new automatic lavatory lock; an electric lift lock, any part of which can be taken out and replaced in a few seconds without removing the case of the lock; and a reversible 4-way rim lock with a double spring live bolt action. A mounted model demonstrates how an ordinary night latch can be forced with a gimlet inside three minutes. A self-locking casement stay, together with the "Bardsley" oil door check and spring form a feature of the exhibit.

Odling, Anselm, & Sons, Ltd. (Crown Wharf, London, N.1). **Stand No. 107, Row F.**

Marble and Granite.—This firm exhibits a variety of coloured marbles and onyx, suitable for wall linings, pavings, columns, caps, bases, pilasters, and balusters, &c. Also several sculptured works of art, including a green crocodile that has been specially selected from the point of view of the markings being an excellent reproduction of the actual reptile. In addition, they exhibit two white marble Polar bears and many other things of interest in connection with interior decoration.

Oliver, William, & Sons, Ltd. (126, Bunhill-row, E.C. 1). **Stand Nos. 3 & 4, Row A, Stand No. 6, Row B.**

Timber.—Messrs. William Oliver & Sons, Ltd., show samples of Cuba and Spanish mahogany; Austrian wainscot oak; English wainscot oak; samples of English walnut; Honduras and African mahogany, teak, American oak, and walnut; and hardwoods.

Pantin, W. & C. (147, Upper Thames-street, London, E.C.4). **Stand No. 321, Row S.**

Elevator.—A portable belt elevator, suitable for loading trucks and lorries with builders' material, sand, gravel, breeze, &c., at a rate of about 30 tons per hour, is shown on this stand. It has a maximum delivery height of 10 ft., and is driven by an electric motor mounted in the base frame. This elevator will work in conjunction with a horizontal troughed belt conveyor. A few lengths of the "Mathews" gravity roller conveyor, suitable for handling bricks, tiles, timber, sacks, boxes, &c.; a "Hanchett" portable combination woodworker, made up of a universal saw, a planer and a drum sander; "Hanchett" hand and gang saw swage; "Hanchett" band swage shaper, and the "Mershon" pressure side dresser are also exhibited.

Parker, Frederick (Catherine-street, Leicester). **Stand No. 167, Row H.**

Machinery.—This firm demonstrates a concrete and tarmacadam mixer of 7 cub. ft. capacity per batch, complete with automatic loading and measuring hopper, combined with a power unit for driving, with regulating water tank, the whole mounted on steel under-frame with transverse axles. A wide range of plant is exhibited, including the "Monarch" solid body type stone breaker, size 12 in. by 7 in., for giving an output of 5–7 tons per hour, complete with screen for working in conjunction, the latter being carried by extended girders from the sides of the crusher, the whole mounted on road wheels as one self-contained unit. A further exhibit is a small size concrete mixer with a capacity of 4 cub. ft. per batch, and capable of dealing with an output of 40–50 batches per hour of mixed material; a 12 in. by 7 in. "Monarch" light stone breaker, suitable for dealing with material of equivalent hardness to blue bricks and for giving an output of approximately five tons per hour is also shown.

Patent Tip-up Bath Co. (39, Broad-street, Birmingham). **Stand No. 230, Row L.**

Baths.—A bath specially designed for use where space is limited is shown on this stand. The water heater is fixed on the wall, so that when the bath is tipped up on end when not in use the heater is enclosed within it.

Rawlplug Co., Ltd. (Gloucester House, Cromwell Road, London, S.W.7). **Stand No. 57, Row D.**

Rawlplugs.—This firm is showing on their stand Rawlplugs, Rawlplug aluminium fittings, Recess screws, and Rawlplug tool outfits. Throughout the day demonstrations in the use of Rawlplugs and Recess screws will be given. The great point which they wish to emphasise in connection with all items which they manufacture or market is the fact that they are labour saving. Recess screws can be driven home without the use of a gimlet, and in about one-third of the time taken to drive an ordinary lot headed screw.
s

Roanoid, Ltd. (29, West George-street, Glasgow). **Stand No. 70, Row D.**

Fittings.—Messrs. Roanoid, Ltd., show a range of manufactures in the new material "Roanoid," a composition manufactured into

suitable fittings for domestic use, such as door-handles, finger-plates, escutcheons, switch covers and plates, bell-push covers and plates, drawer pulls, sash lifts, sash knobs, slip bolts, indicating bolts, moulding hooks, wardrobe hooks, curtain rods and brackets and stair rods and eyes.

Rippers, Ltd. (CASTLE HEDINGHAM, ESSEX). **Stand No. 90, Row E.**

Joinery.—At this stand are shown: (*a*) High-class joinery section: Examples of oak, mahogany, and walnut doors, examples of their patent hospital doors, and examples of decorated mantels and mouldings. (*b*) Housing joinery section: standard doors, standard windows, standard dressers, standard cupboards, standard entrance gates.

Sagar, J., & Co., Ltd. (HALIFAX). **Stand No. 1, Row A.**

Woodworking Machines.—Messrs. Sagar & Co., Ltd., show the following from their well-known series of woodworking machines: The "Premier" combined hand and roller-feed planing and thicknessing machine (electrically-driven), for planing out-of-twist, making glue joints, bevelling and chamfering, rebating, tonguing, grooving, moulding, &c.; a band sawing machine (electrically-driven), for sawing straight or curved work; a semi-automatic chain-cutter and hollow chisel mortising and boring machine (electrically-driven), for general mortising in hard or soft woods; a vertical spindle moulding and shaping machine with tenoning attachment, for moulding and shaping straight or irregular outlines; a builders' tenoning machine (electrically-driven), which is also a convenient machine for cross-cutting and grooving; a radial arm roller-feed circular saw bench for ripping and deep-cutting deals, flitches, &c., into boards by roller feed and for general sawing by hand feed; a four-cutter moulding and planing machine, which will take timber up to 7 in. wide by 3 in. thick; a heavy double-geared roller-feed planing and thicknessing machine for planing and thicknessing, framing, panels, boards, heavy timber, &c., at high speed; a double-spindle canting table dimension sawing machine (electrically-driven); a hand-planing, jointing, moulding, &c., machine, for planing out-of-twist, surfacing straight or taper, squaring up, moulding, and many other operations; and a heavy double-spindle moulding, shaping, trenching and recessing machine, suitable for almost every kind of moulding or recessing work such as working outside or inside edges of straight, circular or irregular mouldings, chamfering, grooving, cutting housings in string boards for stairs, and all kinds of tracery work, &c.

Siegwart Fireproof Floor Company, Ltd (231, STRAND, W.C.2). **Stand No. 92, Row E.**

Floors.—The "Siegwart" fireproof floor is shown constructed with a series of pre-cast hollow concrete beams and delivered on the job ready matured. The beams are placed in position and the joints between grouted with cement and sand. The floor can be designed to carry any load required on considerable spans, and, owing to its rigidity and sound-resisting qualities, is suited for factory, flat and office buildings.

Silicate Paint Co. (CHARLTON, LONDON, S.E. 7). **Stand No. 100, Row E.**

Paint.—The interior of this stand is divided into three compartments. In the gallery front is shown in panels a selection of the many "Duresco" colours now being made by the Company. In the rear are two specimen rooms, the ceiling and corner of one in white Duresco, on the frieze of which is painted in Duresco a floral design, the walls being cream Duresco. The ceiling cornice and frieze of the other room are done in white Duresco, the walls oriental blue Duresco. For the woodwork throughout the Company's flat oil paint "Silpaco" is used. The exterior of the stand is treated with mauve grey Duresco, the woodwork and signwriting, &c., in "Silpaco."

Smyrk & Son (49, RED LION-STREET, HOLBORN, W.C.1). **Stand No. 285, Row P.**

Fittings.—This stand exhibits patent picture rails and hooks, known as the "H. S. N.," the object of which is to abolish the dust-collecting groove of the ordinary picture rail and provide self-locking hooks underneath.

Spedol Manufacturing Co., Ltd. (BRENTFORD). **Stand No. 263, Row O.**

Paints.—The design of this stand has been entirely carried out by a decorator customer of the firm, and the specimens of work shown thereon have been executed under every day working conditions. Each side of the stand is executed with a different "Spedol" product, to demonstrate the class of work that can be done with these materials. Particular attention is directed to the "Stempeau" and "Spemac" panels, as examples of craftsmanship in distemper and enamel work. One side of this stand is designed to represent the back of a house where the uses of "Ferroarmor," the rust-resisting paint, are demonstrated. Amongst other of the Company's products exhibited are "Stempeau" distemper and ceiling white, "Spemac" enamel, "Spedol" varnishes, genuine ready mixed white lead paint, colours ground in oil and dry colours, "Swift" liquid driers, and "Spedol" brushes.

Standard Concrete Machine, Co., Ltd. (SOUTHAMPTON HOUSE, W.C.1). **Stand No. 316, Row S.**

Machinery.—The main exhibit of this firm is their "Standard" concrete machine. It differs from the ordinary run of concrete machines in that it will turn out a variety of products of all shapes and sizes, and has a range comprising most products required in the building, public works, and even garden ornament trades. One of its great points is its simplicity, changing over so readily from one type of mould box to another. The unique action of the "Standard" machine lies in the fact that the mould box is withdrawn from the product and not the product from the mould box. The machine is shown at work turning out a small variety of widely differing products of general utility. A power-driven mixer is also shown.

Stephens & Carter, Ltd. (PADDINGTON GREEN, W.2). **Stand No. 242, Row N.**

Ladders.—This firm has on view a complete range of ladders, barrows, steps, trestles, extension ladders, and other types of building plant, of which they are the manufacturers. They also show a large range of other building plant, such as sieves, screens, rubbish baskets, dust sheets, drain rods, tarpaulins, fall ropes, scaffold ropes, both wire and hemp, and a full-size model of Carter's (Spencer's patent) travelling cradle. This cradle, by means of its special overhead gear, can travel an unlimited length along the front of a building, and if necessary can follow projections, or recesses with equal facility. The firm also have on view a new and improved form of tubular steel scaffolding.

Sturtevant Engineering Co., Ltd. (147, QUEEN VICTORIA-STREET, LONDON, E.C.4). **Stand No. 123, Row F.**

Machinery.—The Sturtevant exhibit includes their powerful vacuum cleaning apparatus suitable for large and medium-sized public and private buildings. The necessary suction in all Sturtevant apparatus is created by an air turbine or multi-stage fan, a type of exhauster adopted by this company in preference to any other, although they are themselves manufacturers on a large scale of rotary positive exhausters, as well as fans of all sizes and types. The latest design of Sturtevant No. 8 Type Turbine cleaning plant, consisting of turbo-exhauster driven by a direct coupled 5 b.h.p. electric motor. A Sturtevant No. 10 Type turbo-exhauster of the latest design is shown, but is not connected to the power supply. Also a powerful portable machine, the Sturtevant No. 5 Type Turbine cleaner, consisting of filter, turbo-exhauster, and direct connected ½ b.h.p. electric motor combined into one unit and mounted on wheels.

Sussex Brick & Estates Co., Ltd. (14, MARKET-SQUARE, HORSHAM). **Stand No. 193, Row J.**

Bricks.—The exhibit of Messrs. The Sussex Brick Co. takes the form of a brick pavilion, on which they show their various Weald clay products, chief amongst which are Southwater vitrified engineering or pressed facings, and S.B.E.C. hand-made flared reds and mixed coloured kiln stocks.

Tann, John, Ltd. (117, NEWGATE-STREET, E.C.1). **Stand 47, Row C.**

Safes.—On this stand are exhibited all classes of fire and burglar-resisting strongrooms, strongroom doors and safes, including the most modern types, constructed to resist the oxy-acetylene blowpipe, high explosives, and other appliances of the scientific burglar. Also "Anchor Reliance" strong-room doors for bullion rooms and plate rooms, and strong-room doors for deed and book rooms, party wall doors to L.C.C. and Fire Offices Committee's requirements, steel plate closet doors, strong-room shelving, fittings and ventilators, safe deposits and fittings. The "Anchor Reliance" fire, burglar, and drill-resisting bankers' doors, incorporating John Tann's patent anti-explosive and anti-blowpipe devices, complete with steel vestibules, ventilating grilles, &c., are shown, together with fire and burglar-resisting anti-blowpipe bullion vault doors. Also crane-hinged water-tight anti-blowpipe treasury doors, of construction certified against all methods of attack. The "Anchor Reliance" 12-corner bent steel "Household" and "Commercial" deed and book safes are prominent, together with their 12-corner bent steel "Security," "Stronghold" and "List K" fire and thief resisting cash, plate, and jewel safes. The "Anchor Reliance" 12-corner bent steel "Dreadnought" quality bankers' safes, fitted with patent anti-blowpipe and anti-explosive devices, will be on exhibition, together with their "Grade 2" anti-blowpipe safes and "Composite" safes, of tested resistance against every known risk.

Ten Test Fibre Co. (TELEPHONE-AVENUE, BRISTOL), **Stand No. 87, Row E.**

"Ten-Test," which is exhibited on this stand is a permanent material for casing interior walls and partitions, and exterior walls and roofs. It can also be used for constructing hoardings, signs, and for temporary buildings such as garages and pavilions. It consists of selected wood fibre from which all the resin, oils and other perishable matter has been extracted by boiling. It is interesting to note the various uses to which "Ten-Test" has been put in the British Empire Exhibition. For showstands it has been used extensively, and also in ceiling and walls of offices and main buildings. Outside, it has been used in the construction of kiosks, a demonstration bungalow, some half-timbered fifteenth century style work, and for casing the two remarkable 100 ft. steel towers and dome of an advertising exhibit. The renderings used on "Ten-Test" for these and other works at Wembley are demonstrated in the Exhibition.

Thames Board Mills, Ltd. (PURFLEET, ESSEX). **Stand No. 150, Row G.**

Wallboard.—As in past years, this firm (formerly the Thames Paper Co., Ltd.), are showing "SX" board for interior lining. A specially designed exhibit to show the practical advantages of this material occupies the same position as in 1922. Various methods of panelling and decoration will be shown, and the ease of fixing, rigidity, and economy advantages of "SX" board are demonstrated. Particular attention is drawn to the use of "SX" board for ceilings.

gular Construction Co., Ltd. (IMBER COURT, EAST MOLESEY, SURREY). **Stand No. 35, Row C.**

chinery.—This firm are demonstrating the ntages of the triangular system of con-tion, wherein walls are formed with an rious exterior face, and a porous interior with perfect bonding, continuous vertical es, &c. They also exhibit the "Trianco" pressure double toggle block and slab ine, which, in addition to producing ó 800 slabs per day under heavy pres-with hand power, also effects economy ment. The "Trianco" tile machine for ucing perfect roofing tiles of the standard in concrete, with hand power, is another it; and finally they are showing models ie houses erected on the Imber Court e, and plans of same.

x Foundry, Ltd. (GREAT BRIDGE, STAFFS). **Stand No. 10, Row B.**

nfounders.—The "Triplex" is exhibited at . A most important feature of all Triplex s is that the whole of the ovens and are built of cast-iron plates in sections. will not rust out, and reduces upkeep to a num; the ovens take a little longer to heat om cold, but retain their heat hours after et iron one has gone cold. The saving in it is claimed, over an extravagant and use-kitchen range is enormous. 34 lbs. per ing day, composed of small coal with about hird slack, is sufficient to do all the work of ousehold for cooking and heating water. eir Triplex grate is watched at work no e at all can be seen if the fire is stoked to ed instructions. Smoke is heat-producing r which is all consumed in a Triplex and d to good use. Owing to the fire being near earth, all dust that is not drawn through lues drops into the ash grating below the

& Bell (27, LINCOLN'S INN FIELDS, LON-DON, W.C.2). **Stand No. 65, Row D.**

wage Installation.—Messrs. Tuke & Bell it a country house sewage installation, rising:—Patent semi-septic tank, with its gs and covers; also aerobic filter with ally designed distributing apparatus to e the amount of attention necessary to the num, and a final humus pit. The installa-s capable of dealing with the sewage from ght-person house. Also a patent "Ideal" re-ng sewage distributor, operated by automatic rs, and a central container instead of the dosing syphon. This machine has serrated l arms, and there are no small holes to choke. ition, again, is reduced to the minimum, his pattern of revolving distributor, which use in all parts of the country, has proved satisfactory for large country houses, and ewage schemes at public institutions and ries.

er Bros. Asbestos Co., Ltd. (ROCHDALE). **Stand No. 160, Row H.**

estos Roofing.—Messrs. Turner Bros. stos Co., Ltd., have a steel structure to their asbestos-cement "Trafford" tiles "Endurol" tiles, the former being fixed on oof to purlins at 3 ft. 6 in. centres, and the to purlins at 20 in. centres. These tiles ade in grey, red and russet brown. It is erest to note that "Trafford" tiles were ed for the British Empire Exhibition at oley, and have been used throughout on e principal buildings, 1,500,000 sq. ft. of g being used. This firm also exhibit "Egis" asbestos cement slates and flat , as well as veneered asbestos cement od panels.

Allan & Co. (SPRINGBANK IRONWORKS, EPPOCHHILL, GLASGOW). **Stand No. 33, Row C.**

ting.—It is claimed that the "Ure to-Back" Grate, which is exhibited on and of Messrs. Allan Ure & Co., successfully meets modern requirements by making the living-room into an attractive parlour or sitting-room. The oven being in the scullery radiates the heat, thereby making the apartment comfortable and also permits of clothes being dried rapidly. The grate is simple in construction and easily cleaned, there being no flues above the hot-plate. Its advantages are threefold as the living-room fire heats the hot-water service, cooks a 14 to 20 lb. joint in oven, and boils or stews on the hot-plate at the same time. A plentiful supply of hot-water is guaranteed, and as a gas grill and boiling ring can be fixed on hot-plate, and a gas fitting into oven, converting it into a gas cooker, it is convenient for use in summer time. It is, it is claimed, the most widely adopted combination of its kind, and is being used in municipal and other housing schemes throughout the country. It has been supplied to the London County Council, Manchester, Glasgow, and other Corporations. Explanatory and illustrated list will be sent post free by the patentees and sole makers, Messrs. Allan Ure & Co.

Victor, J. A. (77A, QUEEN VICTORIA-STREET, LONDON, E.C.4). **Stand No. 206, Row K.**

Woodworking Machinery.—Mr. J. A. Victor, sole British representative for the Ateliers de Construction, Ch. Danckaert, of Brussels, shows a display of their woodworking machinery, including a six-cutter planing and moulding machine; a six-cylinder band re-sawing machine; and a set of machines for joinery manufacturers.

Wadkin & Co. (NORTH EVINGTON, LEICESTER). **Stand No. 202, Row K.**

Woodworking Machines.—Messrs. Wadkin & Co.'s exhibit consists of a selection of their high-speed woodworking machines, all of which are fitted with improvements for giving high and continuous output. A number of machines are shown in operation. These include a 20 in. combined surfacing and thicknessing machine, a new heavy model for surfacing, planing out-of-wind, bevelling, trying-up, rebating and chamfering, stop chamfering, tonguing and grooving, moulding, jointing, &c., the feed gears totally enclosed running in oil, safety circular cutter-block arranged for moulding, spindles running in ball bearings; a 12 in. hand-feed surfacing machine, for surfacing, planing out-of-wind, edging, rebating, chamfering, tonguing and grooving, moulding, jointing, &c., safety circular cutter-block, spindles mounted in ball bearings; a 32 in. circular saw bench, special design to meet the latest Home Office regulations; a 20 in. saw bench, provided with rising and falling table mounted on heavy circular slide, spindles running in ball bearings; a 30 in. band sawing machine, provided with guards for top and bottom wheels, spindles mounted in ball bearings; a heavy vertical spindle moulding machine, latest model fitted with heavy ball bearings to spindle, suitable for all kinds of straight or irregular shaping, with tenoning attachment capable of dealing with all kinds of tenoning; a combined chain and chisel mortising machine, fitted with ball bearings to every running spindle, and both chain and chisel automatically stop immediately the tools are raised from the mortise; a chain mortising machine with hollow chisel attachment, specially built for builders and joinery manufacturers; a tenoning machine, entirely new model, containing many special features, all spindles mounted on ball bearings; a high-speed boring and recessing machine for cutting string boards for stairs, boring, recessing and routing light work, the table has horizontal, lateral and vertical adjustments; and a 14 in. belt sandpapering machine for flat or irregular sanding.

Walpamur Co., Ltd. (DARWEN, LANCS). **Stand No. 133, Row G.**

Paint.—The inside of this stand is divided into three rooms, each representing a portion of a decorative scheme for a different type of interior.

Waygood-Otis, Ltd. (54 & 55, FETTER-LANE, LONDON, E.C.4). **Stand No. 121, Row F.**

Lifts.—On this stand is exhibited special high speed gearless traction lift machine, fitted with patent micro drive self-levelling apparatus. This machinery gives smooth running and the greatest ease in handling when running at high speed. Owing to the absence of any reduction gear the machine is arranged so that the car will stop level at any floor of a building when running with any load and at any speed up to 800 ft. per minute. A model of the latest pattern escalator for conveying a large number of passengers in a continuous flow, similar to those which are being built in their works and erected by them for the London Underground Railway Co.; one standard electric lift machine arranged for continuous current, with latest pattern controller for operating same; one class "F" hand lift operated by endless hauling rope, and one class "FH" hand lift suitable for use in private residences, worked by handle and winding gear from below with automatic foot brake, giving easy control and quiet running, are also shown.

The Welin Trading Co., Ltd. (5, LLOYD'S-AVENUE, LONDON, E.C.3). **Stand No. 275, Row P.**

Decoration.—The Welin Trading Company shows a pavilion displaying the forms of interior decoration that can be obtained purely by the use of their Glasurit japans, varnishes and enamels. A feature of this exhibit is the fact that with the exception of a few special panels the whole is an example of the excellent effect that can be obtained, not by special methods of application in special drying rooms, &c., but by the ordinary methods of a first-class firm of decorators. Even the special panels themselves, whilst produced at the works under ideal conditions, yet have received only the minimum number of coats. In addition there are shown various panels illustrating the actual stages in the production of the special panels referred to. A complete range of Glasurit products is shown and in addition Neutralac, Iron Glasurit, and a complete range of samples of Glasurit varnishes.

Well Fire & Foundry Co., Ltd. (LONDON, W. 1). **Stand No. 224, Row L.**

Heating.—This stand is built of oak, walnut, mahogany and whitewood panelling, carried out in period styles. Seven complete fireplaces are exhibited, each being a type of its own and possessing features many of which are new to the fireplace industry. A new idea is shown in "The Well Fire," made in canopied dog-grate form. It retains all the essential principles of the "Bowes" patent, and is especially recommended for smoky chimneys. Rustless armour-bright iron fireplaces have become a speciality of this firm, and some interesting specimens are on view. An example of a hobbed fireplace composed of old English sand-faced "Tattershall" pressed briquettes of various colours are exhibited, as also are other fireplaces in stone, marble, faience, &c.

Woco Door Company (DASHWOOD HOUSE, LONDON, E.C.2). **Stand 3C5, Row R.**

Doors.—Messrs. The Woco Door Co. exhibit on their stand examples of Woco doors. These doors are manufactured from Columbian pine seasoned by a special process, which ensures their durability and prevents warping, twisting or shrinking, while the 3-ply panels used are manufactured of rotary cut veneers from Columbian pine selected logs, prepared with a special damp-proof cement. Woco doors take an ordinary oil stain and wax compound so readily and inexpensively that they have been proved less expensive, it is claimed, than any other door that requires to be painted. Woco doors are all carefully machine-sanded prior to delivery, and are ready for staining and waxing. The Company carry a regular stock of some 15,000 doors in London and the same quantity in Liverpool, so that prompt deliveries can be made.

White, Thomas & Sons, Ltd. (LAIGHPARK, PAISLEY). **Stand No. 85, Row E.**

Machinery.—Messrs. Thomas White & Sons, Ltd., have a large variety of machines on view, including one of their 9 in. by 4 in. planing, moulding and matching machines with a special arrangement of heads, but the machine at Olympia will be arranged with heads in the ordinary British way as against the Continental style, and will have an extra top head and beading head. The advance which has been made in high-speed planing is very much evidenced by a close inspection of the machine. Everything is built on a solid British pattern, made to last, and the conveniences of the machine are such that all adjustments can be made from the front and the setting-up time of the machine is reduced to a minimum. In addition to these conveniences there is embodied in this design the White patent loose spindle which enables a cutter-block to be removed from the machine at the expense of only one or two minutes' labour and without the necessity of removing the ball or other bearing. The 9-speed gear box with which these machines are fitted should also be seen. This gear box is quite capable of dealing with feeds up to 125 ft. per minute, even though the timber be wet. In addition to this planer, Messrs. White will show their straight line edger which is intended to supersede the push bench.

The Yorkshire Copper Works, Ltd. (LEEDS). **Stand No. 293, Row Q.**

Copper.—Messrs. The Yorkshire Copper Works Ltd., make a special display of light gauge tubing for use in connection with patent fittings for housing work and pipe work of every description. The patent fittings used enable specially thin gauge tubes to be installed with a resulting decrease in cost, and at to-day's prices copper tubes are much cheaper than lead. It is, they claim, rapidly becoming the practice of architects and other authorities to specify copper tubing for domestic work. It is, they maintain, ideal for hot water supply. When used in conjunction with patent fittings the necessity for screwing is obviated and the cost of the installation when light gauge copper tubing is used is cheaper than in lead. By using copper (1) All pipes can be laid in sight; (2) A constant clean water supply is obtained—no contamination of water or diminishing supply owing to rust troubles; (3) A sound efficient installation is ensured, the life of the installation being two or three times that of similar work carried out in other materials; (4) No burst pipes. Tubes tested to 1,000 lbs. internal hydraulic pressure.

In our last issue, owing to a typographical error, a slight mistake was made in our reference to Messrs. G. Farmiloe & Sons, Ltd., Stand No. 66, Row D, at the Building Exhibition, with regard to their speciality for repairing slate and lead roofs. The word we gave was "Mermetex"—this should, of course, have been "Hermetex."

Ventilation.

In this little book* the principles of the system known as natural ventilation have been placed before the reader in the striking form of a series of quotations from the public pronouncements of a great many famous persons.

Scientists, medical men, architects, journalists, and others have been found who not only give strong support to the natural system of ventilation but express it in language of uncompromising plainness and vigour. The style of composition, though dramatic, is well managed and there is no escaping the point that a system, of ventilation designed in accordance with natural laws is likely to be efficient. The information conveyed is rather more likely to stay in the reader's memory than if it had been put forth with all the grim solemnity of the usual scientific treatise. Anyone called upon to design the ventilating scheme for a public building should certainly make a point of reading the book.

* "The Ventilation of Public Buildings." By Robert Boyle. (London: Robert Boyle & Son). 1923. Price 6s. net.

THE WEEK IN PARLIAMENT

Lead Poisoning.

Mr. Henderson, the Home Secretary, has introduced a Bill to make better provision for the protection against lead poisoning of persons employed in painting buildings.

Numbers of Employees.

Mr. Greenwood, in reply to Mr. Simon, said that the question as to how many men in each section of the building trade were estimated to be required to build 200,000 A3 houses per annum, had been considered by the Committee of Representatives of the Building Industry, and the Minister of Health hoped shortly to be able to make a statement.

The Subsidy.

Mr. D. G. Somerville asked the Minister of Health in how many cases the subsidy under the Housing Act of 1923 had been refused, firstly, to requests by local authorities in respect of their own buildings and, secondly, to applications from private builders put forward through those local authorities?

Mr. Greenwood said that so far as local authorities' schemes for building houses themselves were concerned it had been found necessary in a number of cases, in view of the amount of work in hand or the lack of essential skilled labour in the locality, to limit immediate approvals to an instalment of the proposals, the principle being to get houses actually built and occupied as quickly as possible. In the case of private enterprise individual applications for subsidy were dealt with by the local authorities and when the Minister had approved a general scheme he did not receive details of the approvals or disapprovals in particular cases. On March 1 local authorities had issued certificates of approval under the scheme covering 41,060 houses.

Mr. Somerville protested against being "put off with generalities," and asked for more definite information, but no further reply was forthcoming.

The Leasehold System.

Mr. Wheatley informed Mr. Gould that so far as he was aware the leasehold system had not added materially to the problem of the housing of the working classes, and he did not think it would be practicable to deal with this question in the forthcoming Housing Act.

Houses Built in London.

Mr. Greenwood informed Mr. Gilbert that during 1921, 1922 and 1923 the numbers of working class houses erected by private enterprise with State assistance were 1,027 in the County of London, and 6,630 in Greater London (including the County). Statistics were not available showing the numbers erected during this period without State aid, but during the year ended September 30 last the number of houses erected by private enterprise of a rateable value not exceeding £35, were, in the County of London, 994, and in Greater London 6,794.

Surface Transport.

Mr. D. G. Somerville asked the Minister of Transport whether, in view of current problems, he would consider the desirability of instituting an inquiry into the advantages or disadvantages of different forms of surface transport in the urban and semi-urban areas?

Mr. Gosling said that problems of the nature suggested in the question were under constant review in his Department. He saw no sufficient reason, however, for instituting a special inquiry into these particular points at present.

The Rent Bill.

When the debate was resumed on Monday, the Government asked the House to allow Clause 1 to remain in the Bill, on condition that an amendment was moved in Committee to provide that no order should be made for the eviction of an unemployed tenant unless Court was satisfied that there had be reasonable time in which the tenant apply for relief to the local authority, an such authority to consider such applica Any question of recouping the local autho out of the National Exchequer or of pl the burden on the landlord was not t proceeded with. Many members, how pointed out that the new proposal involve no alteration in the law, as the already had to take all the circumstances consideration, and that the final decision still left in his discretion. They presse Government to drop Clause 1 altogether a proceed with the rest of the Bill, which be passed without difficulty. The Govern however, remained adamant, and clung t whole Bill, stating that amendments cou moved in Committee. Amid much excite the second reading was rejected by 221 to an adverse majority of nine. As, howeve Government did not make the question o confidence, they have not resigned, an "agreed" Bill dealing with evictions will bably be introduced.

Later in the evening, following the Go ment defeat, Mr. E. D. Simon's Preventic Evictions Bill was read a second time, a Tuesday the Prime Minister announced tha Government would not introduce another Bill, but would endeavour, in Committe amend Mr. Simon's Bill, which, in its pr form, was "altogether unsatisfactory." understood that Mr. Simon's Bill incorpo the second clause of the "dead" Goverr Bill, which dealt with evictions under last Act.

Housing Survey.

Mr. Wheatley informed Sir W. de Frece the question of a survey showing numb new houses needed was under consideratic

The Wembley Exhibition.

Answering Mr. Purcell, who asked if approach had been made to the trade unic the building industry who had members ployed at the British Empire Exhibitic relax their rules regulating overtime, in or assist in overcoming any delay in openi exhibition, Mr. Thomas, Colonial Se replied: "Yes, Sir, and I have been that everything will be done in the di requested.

World's Largest Floating Dock.

The largest floating dock in the wor 60,000 tons displacement, built by Messrs. strong, Whitworth & Co., to accommodate liners at Southampton, will leave the Ty Southampton on April 14.

Building Trainees.

Mr. Walter Betts, the General Secret the Trainees' National Guild, stated re that a meeting may shortly be called at Ministers will be invited to explain the sit which has arisen over the question of the a tion of building trades trainees in Gover schemes. Mr. G. Betts pointed out tha Shaw, Minister of Labour, had stated t was proposed to spend £2,700,000 this fin year on the training schemes, as a £2,250,000 spent last year, an increase of half a million, but there could be no pc expanding the schemes unless efforts were to absorb the men into industry when t Mr. Betts added further: "Mr. Shaw re promised a deputation of the Guild th question of the absorption of the building trainees on any Government scheme shoul the careful consideration of both the Mini Health and himself, and we are making representation to the Ministers concerned matter. This apparent neglect on the the Government to redeem its promise disabled is causing considerable feeling a the men concerned in all parts of the co

THE BUILDING TRADE

E SUPPLY OF OPERATIVES IN THE BUILDING INDUSTRY.—II

By T. P. BENNETT

e Labour Required to Erect a Specified .—The question of the adequacy of atives, as shown by the 1921 Census, tter for consideration in conjunction normal output of commercial buildings, probable output of private houses and osed output of houses under the Govern- ogramme. Whether it is possible to reliable statement on this matter is open to doubt, but it may be possible, ence with the employers and operatives, ain an approximate figure which could as the basis for discussion. With this iew I append a table furnished by Mr. Selley, the President of the National on of House Builders, which I am has already been given in evidence Government Committee :—

Wages based on 10,298 Feet Cube (Government Type).

	@ £	£165 s.	d.	Skilled hours.	Proportion of Operative per house based on a 44-hour week for 52 weeks per year.	Unskilled hours.
layer and Labourer	39	12	0	272	1/8th	272
nter and Joiner	44	11	0	609	1/4th	—
rer and Labourer	23	2	0	153	1/15th	153
ber and Mate	13	4	0	90	1/25th	90
er and Glazier	14	17	0	188	1/12th	—
, Tiler and Labourer	4	19	0	33½	1/68th	33½
al Labourer, Excavator, &c.	24	15	0	—	1/6th	396
	£165	0	0		Approx. 3/4ths of an Operative per house per annum.	

E.—There are many items of actual wages, such as a general foreman, watchman, and un- f materials which cannot be allocated to any particular trade. The general foreman has ributed over all trades, but other work is included in General Labourers.

Conditions of Entry into the Building A general survey of the prospective f labour shows that in London there boys who wish to become building ratives (or apprentices) than there are s willing to offer vacancies.

trictions upon the Number of Appren- gaged.—The maximum number of es is limited by the operatives to th a maximum of 8 in any one shop, special cases, which are dealt with ondon Building Trades Apprenticeship e. In practice it is found that the of the building trade employers are ss than the average of 1 in 7. A few employers are prepared to take con- more than the maximum of 8 or than 7 rule would allow. In these cases, ction comes into operation and as a difficulties are aggravated. In the there are more employers willing to entices than there are boys willing ntured, and it is probable that if the on rules were relaxed so that the nployers were allowed to take the number of apprentices and the employers were induced to take a rtion of apprentices, there would be of boys willing to enter the industry. pal reasons for the *dearth of suitable*), are as follows :—

employment and insecurity of tenure. time owing to wet weather. all increase of wages of skilled men he wages of unskilled men. atively high wages which can be ed by unskilled boys in blind alley ations. oyment pay for persons under 21. pposed social inferiority of workers in al trades.

unemployment, even in so recent a period as 1923, and in the face of the necessity of providing through their unions substantial, and even very large, sums for unemployment pay, they naturally do not see the need of largely augmenting the total number of operatives. There are many sidelights, reservations and reasons for the views held, and many erroneous impressions. These require extensive investigation and sympathetic consideration before due weight can be given to each and the view of the men adjusted to the broad economic conditions of the industry in which they are working.

5. *Methods of Training.*—Assuming the numbers to be ascertained, there are broadly speaking five possible methods of entry into the building industry. These are :—

1. Ordinary apprenticeship to a building trade employer.
2. Tuition in a trade school, plus indentures.
3. Over-age apprenticeship.
4. Promotion from labourers.
5. Dilution.

Up to the present the recognised means of entry into the building trades has been by means of apprenticeship. This method of entry has steadily declined for a long period, and there are special reasons why it is extremely difficult to revive it on a large scale at the present moment. Its advantages may be summed up as follows : It provides

(*a*) A definite period of training ;

(*b*) Continuity of employment ;

(*c*) Familiarity with working conditions of the industry at an early age ;

(*d*) Graded wages ;

(*e*) Capacity to earn wages from the time of leaving school.

The disadvantages are—

(*a*) In many cases the boy is not properly or systematically trained ;

(*b*) An employer cannot see his way to engage apprentices on a substantial scale ;

(*c*) The tuition is often of a most unsatisfactory character, and at best follows the empirical methods which have been in existence for many years ;

(*d*) There is no possible chance of raising the standard of skill in the industry ;

(*e*) Modern practice tends to confine the operative as well as the apprentice to a limited number of operations.

Apart from the serious obstacles in the way of reviving the apprenticeship scheme there are certain inherent objections to it, just as there have been recognised to be objections to the system of architectural pupilage. The two cases are in many respects parallel, and many of the advantages of the schools of architecture can be obtained in schools for the building trades. In many country districts, however, apprenticeship is the only method by which any kind of training can be provided, and apprenticeship will, therefore, remain a very important source and a very important method of training operatives, and of great value in so far as the actual number of boys with whom it deals is concerned.

It is necessary to undertake a serious and extensive campaign for convincing the commercially-minded employers that apprenticeship does not entail financial loss, but eventually means financial gain through increased efficiency and skill, and an increase in the number of operatives available. How far it is possible to revive apprenticeship on a big scale in country districts is perhaps open to doubt, but it is beyond question that some effort of this kind is necessary. Until such time as the total number of apprentices in the industry is proportionate to the total number of operatives, it is necessary that the restrictions upon the number of apprentices indentured to suitable firms should be removed, and that some relaxation of the rule of one in seven should be accepted. At present employers willing to do their utmost to train apprentices are seriously handicapped.

Training in Technical Schools.

Considerable advances have been made in large towns in connection with the training of apprentices in technical schools. Here boys are received for a whole-time day course between the ages of 13 and 14, and remain in the school for three years. During this period they follow a curriculum similar to that set out in appendix A, from which it will be seen that the course provides for the continuation of elementary school education in English subjects, with the addition of practical and scientific subjects relating to the building industry. It is found in practice that very great intellectual development takes place, and that the boys, in addition, acquire considerable skill in handling tools. The development of the intelligence of the boy is perhaps of even greater importance than the development of his vocational skill, and it is impossible to give too much importance to this aspect of the matter; In practice it is generally found that the standard of pure craft ability or, in other words, of wage earning capacity of a boy at the age of 16½, is superior to that of the boy who has spent a corresponding period in the workshops, and it may be justly claimed that at the age of 21 the product of a joint technical school and works apprenticeship is infinitely superior to the product of the works apprenticeship alone.

An objection sometimes raised against the school is the fact that between 13½ and 16½ parents are not able to maintain the boy without wages as well as pay a nominal fee for his tuition. In a few cases boys receive scholarships which assist in this matter. The careful and thrifty

parent is able to bear this expense, but it is to be feared that many parents are not prepared to face it, and therefore if school training is to be regarded as an important factor in recruiting labour for the building industry in large towns it will be necessary to take account of this factor.

Over-age apprenticeship has been proposed as a temporary means of providing additional operatives. This seems to be the soundest of all the proposals put forward as a temporary means of dealing with the admitted shortage of skilled labour. The prospective operative should be bound under some system of indenture which will give a minimum period of three years of training, which may be regarded as the shortest length of time in which a man can be trained in building crafts; of this period, at least two years should be spent in a trade school and tuition should not be entirely of a craft character. It should include such subjects as geometry, building construction, mathematics and English. By this means a man will have a sound theoretical foundation upon which to develop his practical skill, and will be able to extend that knowledge by attending evening classes. Obviously it will be necessary to consider some system of payment by grant, owing to the age at which a man would commence his indentures. The advantages of this school training will be as indicated in paragraphs 1 and 2 above.

Promotion from Labourers.

It is curious that no serious movement has been made in the past to provide a properly graded method of progress from the position of labourer to that of skilled craftsman. Such a movement would be in strict accord with the accepted democratic principles of our day and would provide a real incentive to the industrious and energetic man to rise. It is, of course, evident that such a possibility would of necessity mean a system of examinations or tests by craftsmen themselves setting up a standard of craftsmanship. This would have the advantage of raising the general level of skilled work in the building trade and would do much to restore the pride of craft which was so great an asset to the old guilds, the loss of which is everywhere deplored.

Dilution.

Dilution has been mooted as a temporary solution of the labour shortage, but dilution is a two-edged sword of the most dangerous character. It sets up a body of men who are at an admittedly low level in skill, who do not go into the trade with any real knowledge of its work or its problems, and who in many cases demand craftsmen's wages although they are inferior in value to an intelligent labourer.

Any scheme which brought a large number of such men into the trade would create widespread unrest and dissatisfaction and would do untold harm to everyone concerned. In the words of an architect: it would be necessary to write a C3 specification, to accept C3 work and to pay an abnormally high price for it. Dilution is useless, and the sooner it is forgotten the better.

The above may be summarised as follows:—

1. Before any proposals can be put forward for considering the personnel of the industry, accurate statistics must be obtained (*a*) of the number of operatives in the industry subdivided into trades; (*b*) the relative ages of the operatives; and (*c*) an actuarial calculation of the average working life of an operative.

2. An effort must be made to estimate the probable volume of buildings which will be executed within the next ten years, and from that ascertain the number of men who will probably be absorbed. This is admittedly an extremely difficult calculation.

3. The unemployment returns of the last few years must be examined and definite proposals put forward in a concrete form, which will show the men that the risk of unemployment has not increased, and that, so far as can be ascertained, they are not being rendered liable to undue risks.

4. The conditions of employment in the industry should be considered with a view to providing as much continuity of employment as possible, and to providing a wage which is commensurate with the standard of skill and length of training required. In particular, such obviously objectionable features as loss of time for wet weather should be removed. It has been stated that bricklayers, who have the greatest loss of time, face an average loss of 5 per cent. If this is so, I suggest that it is a loss which might be borne by the industry and not the men. Some such revision is undoubtedly necessary, in order that the number of apprentices required may automatically apply for entry.

5. Careful consideration must be given to the method by which the operative is to be trained after he has been secured. This, in my opinion, should normally consist of three alternatives:

(i) Apprenticeship;
(ii) School training, plus apprenticeship;
(iii) Promotion from labourers.

Appendix A.

The Trade School of Building.

Junior School Time Table.

Subject.	Hours. 1A.	1B.	2A.	2B.	3A.	3B.
English	5½	5½	4	4½	2½	2½

* Taken in Joinery, Decorating and Plumbing alternatively for one term each.

SANITATION OF TWO THOUSAND YEARS AGO

Sir Banister Fletcher lectured at the Central School of Arts and Crafts, on February 27, on Roman works of public utility, aqueducts, bridges and tombs. The genius of the Romans for organisation was nowhere better demonstrated than in their provision for a good supply of water for the living, and in their regulations for the burial of the dead outside the city walls. An ample water supply was necessary for the Imperial City, and it was found in the hills not very far away. They set to work to pile up stone upon stone to form the great arches which carried the water in a covered "specus," free from contamination. It might be asked why they expended money and labour in carrying water at such a height instead of underground. The reply was that pipes had to be made of costly lead or bronze; they had not the lead, and bronze was very costly. It was thus cheaper by forced human labour to construct these great arches across valleys and rivers into Rome. The regulations for the water supply threw light upon Roman administrative methods, for officials were appointed by the Senate to secure the purity of the water. Judging from their careful provision of water for thermæ, fountains and houses, it would appear that, in those far-off days, cleanliness was next to godliness among the Romans. They also strove to secure the sanitation of the city by prohibiting burial within its walls, and thus it was that great monumental tombs of different types lined the roads that approached Rome and Pompeii, and even the great Mausoleum of Hadrian was on the other side of the Tiber.

SHRINKAGE OF SE SONED WOOD 3,000 YEARS AGO

That wood seasoned for 3,000 years sh retain sufficient vitality to be capable of fu shrinkage is very extraordinary, but none less certain. Mr. Howard Carter, in his det account of the Tomb of Tut-ankh-Amer Luxor, has described several valuable partic concerning which very few ordinary p possessed any knowledge whatever. His e experience of first-aid methods adopted fo preservation of different classes of ob includes woodwork. This material, natu presented many problems, and, of course, and the white ant furnish the chief en In unfavourable conditions, as might be pected, nothing remains but black dust shell, which crumbles at the touch. L however, is the most favourable site in E and in the present tomb most of the ti work remained solid and good. Unless work is in the very last stage of decay its servation is always possible by the applic of melted paraffin wax. By its use even nants can be made perfectly solid and handle. At Tut-ankh-Amen's tomb the diffic arose from the changes which subsequ happened in the condition of this sound owing to changes of atmosphere which c the shrinkings. The Egyptians usually a on wood a thin layer of gesso on which pared surface they painted figures or appli overlay of gold foil. When the ancient started to shrink the gesso began to loose buckle, becoming very liable to fall off a lost. The angles chipped away, and to pr this the surface was sprayed with a solut celluloid in anylacetate to fix it. Howev about a month's time, the fissures exp owing to change of temperature from the humid atmosphere of the tomb to the airiness of the laboratory. The gesso not virile was coming off, risking the loss of of the painted ornamentation. Drastic me became urgent. Melted paraffin fortu proved effective and penetrated the mat holding everything firm, and instead of the colours they became more brilli before. The wax had to be brought a possible to boiling point, otherwise it chill and refuse to saturate. The wax, i of blister, was applied by a pipette. W the wood will shrink further remains seen.

MEN IN BUILDIN TRADES

In a written reply to a question the M of Health gave the following figures numbers of men employed in the building in England and Wales:—

	Census 1901.	Census 1911.
Bricklayers	109,160	92,312
Carpenters & Joiners..	243,075	176,978
Plasterers	27,144	21,230
Slaters	8,461	6,946
Others	445,904	444,390
Total	834,144	741,856

As will be seen, it shows a consi decrease.

Obituary.

The death occurred recently of Mr. C of Prestatyn. Mr. Burt was formerly a l contractor in Liverpool, and on his ret from business went to reside at Prestaty

The death took place recently of Mr Davies, builder, Bryn Awel, Trel Rhondda Valley.

The death took place recently at I of Mr. John White (retired builder), 78th year.

THE NEW RENT BILL

The short Bill which was introduced last ek by the Minister of Health as a Governnt measure consists of three operative nses. The first provdes that, notwithstanding ything in section 5 of the Rent Act, 1920, altered by section 4 of the Act of 1923, " a irt shall not make or grant an order or lgment for the recovery of possession of a elling house to which the principal Act plies, or for the ejectment of the tenant erefrom on the ground of non-payment of nt, in any case where it appears to the court at the non-payment is due to the inability of tenant to obtain employment, unless the irt is satisfied that greater hardship would caused by refusing to grant such an order an by granting it." The effect of the clause pears to be to substitute for the general distion now vested in the court in the existing t (" and in any such case as aforesaid the irt considers it reasonable to make such der ") the duty of weighing the degree of rdship between the landlord not receiving nt and the tenant unable to pay it. This nstrates the curious development of the prinle of rent restriction, for the landlord is ced upon an entirely different footing to y other owner of property, and the burden keeping an unemployed tenant rent free is ced upon him, unless he can prove, not al hardship, but greater hardship than his ant. On what possible principle can the rden of unemployment be placed thus on ate shoulders?

Then again, the test to be applied by the irt is not the ability of the tenant to pay, t his inability to obtain employment. The ant himself, owing to unemployment, may without means and unable to pay the rent; t in the house, living with him, his wife or ns and daughters may all be earning money, he may have sublet a portion of the house, d the family as a family may well be able pay rent; but the tenant himself may come ore the Court and prove his own unemployent and want of means, and the landlord y be compelled to keep the family rent free, ilst himself liable for the rates. This clause l certainly need drastic amendment. Since s article was written this clause has been ected by Parliament, and the Government s endeavoured to amend the Bill so as to ke it prohibit eviction until the tenant has l a reasonable opportunity of applying for ief from the local Poor Law authority. A hnical difficulty has arisen as to the amendnt of the clause in this Bill, as it involves ' money measure," and thus the Bill is ctically withdrawn. But as no serious obtion has been raised to the remaining uses, at any rate for the purpose of a second ding of the Bill, we publish our original nments on these clauses, as they will cerly require consideration.

The second clause deals with paragraphs (iv) l (v) of subsection 1 of section 5 of the ncipal Act, that is, section 5 as altered by tion 4 of the Act of 1923.

The legislation as it stands is not at all clear, and before referring to the new Bill must show how it stands. In section 5, section (1) (*d*) one of the grounds for obning possession is that the dwelling house reasonably required by the landlord for ocation as a residence for himself or for any or daughter of his over eighteen years of , but this is provisional on the Court being sfied that alternative accommodation shall available.

Following upon the group of paragraphs in ch this provision is contained, there are ther set of paragraphs headed " The existe of alternative accommodation shall not be ondition of an order or judgment on any the grounds specified in paragraph (*d*) of subsection," in the cases enumerated in ain paragraphs, and paragraph (iv) proes that where the landlord or the husband or e of the landlord became the landlord before e 30, 1922, the requirement of alternative ommodation shall be dispensed with gether if the house is required as a residence by the landlord himself, or for any son or daughter over eighteen years of age; while paragraph (v) provides that if he became the landlord after June 30, 1922, then the Court has to be satisfied that greater hardship would be caused by refusing the order for possession than by granting it. The new Bill substitutes for both these paragraphs one single paragraph as follows:—" Where the dwelling house is reasonably required by the landlord for occupation as a residence for himself, and the Court is satisfied that greater hardship would be caused by refusing to grant an order for judgment for possession than by granting it."

It will be seen that the effect of this amendment is to eliminate altogether the distinction made according to the date when the landlord became landlord, to eliminate the husband or wife of the landlord, and to throw the cases where the house is required for sons or daughters back on paragraph (*d*). Thus, where the house is required for a son or daughter under paragraph (*d*), the Court would have to be satisfied " that alternative accommodation is available which is reasonably suitable to the means of the tenant and to the needs of the tenant and his family as regards extent, character, and proximity to place of work, and which consists either of a dwelling house to which this Act applies, or of premises to be let as a separate dwelling on terms which will afford to the tenant security of tenure reasonably equivalent to the security afforded by this Act in the case of a dwelling house to which this Act applies."

But where the house is required by the landlord for his own occupation, the Bill as drafted leaves it obscure under which paragraph the application must be treated—paragraph (*d*) or the new clause (iv)—and both seem applicable to precisely similar circumstances. There was always some obscurity in the Acts on this point, but this Bill, as drafted, makes the Act directly contradictory, and this point must certainly be cleared up in Committee.

Clause 3 is a curious piece of retrospective legislation.

Subclause (1) of clause 3 is as follows:—" Where any order or judgment has been made or given before the passing of this Act, and in the opinion of the Court the order or judgment would not have been made or given if this Act had been in force at the time when such order or judgment was made or given, the Court, on application by the tenant shall, unless the order or judgment was executed before March 31, 1924, rescind the order or judgment, and in lieu thereof make such order or give such judgment as the Court shall think fit for the purpose of giving effect to this Act."

We take objection to the form of this subsection, which enables any tenant to require a rehearing of any case decided before the passing of this Act in which the judgment or order has not been executed before March 31 last, and is a serious blow to the finality of justice; and subclause (2) carries the matter further, for it provides: " Where the Court has so rescinded any order or judgment, the Court shall, if the order or judgment was executed on or after March 31, 1924, and notwithstanding that the landlord or any person claiming under him is in possession, make such further order or give such further judgment as may be necessary to enable the tenant to resume possession of the dwelling house upon such terms as appear to the Court to be equitable." In other words, these clauses, because the Legislature has introduced a piece of emergency legislation to meet particular cases of alleged hardship, read in conjunction with clause 2, may subject landlords of any restricted house of any value who have recovered possession under section 5 as unamended by clause 2 to double proceedings, and to eviction if they have regained possession since March 31, and the Courts were asked to find " equitable " grounds for such a policy. We cannot think that Parliament will allow such a perversion of justice or permit the faith in legislation to be so shaken, and these clauses should apply only to working-class dwellings in any case.

Subclause (3) provides that where a landlord has, after March 31, taken possession of a dwelling house under a judgment or order so rescinded, such possession shall not in any case exclude the dwelling house from the operation of the principal Act.

We have said the Bill consists of three operative clauses, for the fourth clause is only formal, giving the title and providing that the Act shall be read as one with the existing Acts. Landlords and house property have long been made the victims of legislation, and the disastrous consequences to housing have been entirely overlooked in the desire to protect a certain class of tenants; but this Bill appears a hastily devised measure to remedy what may be certain grievances with a lamentable lack of statesmanship or foresight.

We notice that rent restriction is always spoken of as though it only affected the very poor, and this Bill is directed to relieving the " unemployed "; the fact is entirely lost sight of that rent restriction embraces houses the standard rent or the rateable value of which does not exceed £105 in the Metropolitan area, £90 in Scotland, and £78 elsewhere. The present Bill has been introduced more especially with reference to housing conditions in Scotland, and this seems a suitable occasion once more to urge that rent restriction should now be limited in any form whatever to the low-valued houses which may properly be termed " working-class dwellings."

This Bill is admittedly an emergency measure, and therefore it certainly should be limited to the class of dwelling house where the emergency exists, and we trust this will be insisted upon in Committee; but in any case, as we have shown, the Bill is badly drafted, and as it has to be read as one with the existing Acts, clause 3 would cover orders and judgments made under clause 2 as well as clause 1—that is, cases where possession has been obtained on other grounds than nonpayment of rent. The continuance of restriction as regards the higher-valued houses is not only entirely uncalled for, but it is the cause of hardship to persons who occupy such dwelling houses. So long as restriction is continued houses will not be let on lease, and there is a very large class of persons who cannot buy their houses, especially at the price which is asked, owing to restriction having limited the supply and discouraged the building or owning of houses to be let on lease by way of business.

St. Paul's Bridge.

Sir William Bull, M.P., presided at a meeting of the Metropolitan Members of Parliament, at the House of Commons recently, when a deputation attended from the Royal Institute of British Architects, the London Society, the Town Planning Institute, and the Architecture Club, to present their views on the proposed St. Paul's Bridge.

Mr. Paul Waterhouse (Royal Institute of British Architects) stated the objections to the bridge, especially its situation at the northern end, which would, in his opinion, simply lead to confusion.

Mr. Carmichael Thomas (London Society) and Mr. W. R. Davidge (Town Planning Institute), explained the objections of their respective societies to the scheme.

Sir Banister Fletcher described the scheme as a monstrous idea and against the City interests.

Viscount Curzon said he would press for an inquiry into the whole scheme in view of the proposed circular road round London.

Sir William Davison, M.P., Lieutenant-Colonel Fremantle, M.P., Sir Herbert Nield, K.C., M.P., and other members, having expressed their objections to the scheme, those present, on the motion of Viscount Curzon, passed a resolution urging the Ministry of Transport to spend no money on the scheme until Parliament had been consulted.

BOOK REVIEWS.

Practical Cabinet Making. By H. G. Phillips. (London: George Routledge & Sons, Ltd.). Price 5s. net.

For long enough we have been satisfied with atrociously bad modern furniture, with indifferent copies of past pieces, or—those who can afford them—with genuine antiques. The inevitable results have been a gradual drying-up of the fount of inspiration and a decay of good craftsmanship. To-day, however, there are, fortunately, signs of real improvement in this deplorable state of affairs. No one could have visited the recent Industrial Art Exhibition at the South Kensington Museum without being struck by the high standard of the furniture exhibits. Many of the designs were exceedingly good, and, moreover, they were expressive of the tendencies of the day. One saw there the labour-saving aspirations translated into terms of art, as it were, for the predominant note was a simplicity—an austerity it might almost be called—and a simplification of mouldings. Moreover, the workmanship was of a very high standard and such as would compare favourably with that of any epoch.

Mr. Phillips' book, therefore, is a sign of the times. It is essentially a practical work, and is mainly addressed to those who handle the tools. It also contains chapters on machines and workshop organisation. Many of the actual designs are indifferent, but the main use of the book is for those who would actually make furniture, rather than for those who would design it; but in so much as no one can design furniture who is unfamiliar with the method of its manufacture, even if he be himself unable to handle tools with skill, it is a book that may well be of value to anyone interested in the making of good furniture. And what architect is not? The illustrations are numerous and lucid.

Wireless for the Amateur. By J. Roussel. Authorised translation with additions by H. B. Grylls. (London: Constable & Co.) Price 14s. net.

To those who desire to have more than a superficial knowledge of wireless, we would strongly recommend this book. It is simple and thorough and such as anyone with a familiarity with the elements of electricity should have no difficulty in following. It is one thing to know the function of the valve in receiving and transmitting, it is another to understand the principle of its action and the relation of filament, grid, and sheath. It is one thing to know that C.W. depends upon heterodyning, another to grasp exactly what deterodyning is (a fine example of heterodyning can be observed with two single-cylinder motor cycles running side by side, but whose engines are running at slightly different speeds). This book, indeed, is a sane combination of theory and practice. Nowadays it is easy enough to acquire a working circuit diagram from which, with scarcely any knowledge, it is possible to build up a successful set, but those with an inquiring mind will not be satisfied with mere mechanical efficiency; they will be beset with the why and the wherefore of the phenomenon. By reading this lucid book they will obtain much enlightenment. Sooner or later the study of wireless, as, indeed, of all other scientific subjects, will merge into higher mathematics, and for those who would pursue the subject into these abstract realms there is an interesting chapter which may stimulate to further research. The historical development of the subject is also dealt with, and the translator has added some useful information in connection with British broadcasting. The times and wave-lengths of the various stations all over the world are tabulated, and details of time signals are given. It should be pointed out that the book is written by an amateur and is essentially for amateurs, and the text and the diagrams are consistently clear.

RATES OF WAGES IN THE BUILDING TRADE

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Barrow-in-Furness	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Barry	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Bath	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/1½
Bedford	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0¾
Birkenhead	1/9	1/9	1/8½	1/9	1/9	1/9	1/8½	1/4
Birmingham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Bishop Auckland	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Blackburn	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Blackpool	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾

(For rates of wages in the Building Trade in Scotland, see page 613).

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

APRIL 12.—**Birmingham.**—RESTORATION WORK.—Restoration of the tower of Northfield Parish Church, Birmingham, and other incidental work. o DATE.—**Dundee.**—BANDSTAND.—Erection bandstand at Baxter Park, for the T.C. iculars from Mr. G. Baxter, City Engineer, Commercial-street, Dundee.

he death took place recently, at Edinburgh, Mr. Charles S. S. Johnston, architect, aged

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND

Dumfries. — LABORATORY. — The Dumfriesshire E.C. has passed plans for the erection of a new science laboratory and art room at George-street School, Dumfries. The estimated cost is £2,200.

Glasgow.—OFFICES.—The Lanarkshire E.C. has decided to purchase offices in Glasgow for its headquarters, which are to be transferred from Hamilton. The cost is £65,750.

Portobello.—CLOAKROOMS.—The Edinburgh Corporation Cleaning and Lighting Committee has decided that provision should be made for the erection of lavatories and cloakrooms at Bath-street, Portobello, in the ensuing year's estimate. The probable cost is £2,500.

Aberdeen.—SHELTER.—The Corporation Links and Parks Committee has decided to erect a shelter and lavatory at the Bay of Nigg, the former to cost £120 and the latter £390. The question of erecting a bandstand at the bathing station will again be considered when a report is received from the B.S.

Fallin.—HOUSES.—The Kirk Session of Bannockburn has decided to build a house at Fallin for the missioner. The Stirling Presbytery has given their consent.

Plean.—MANSE.—The Presbytery of Stirling submitted plans for the manse which is proposed to be erected at East Plean. The Presbytery remitted the plans to a committee with powers.

EDINBURGH HOUSING

At Edinburgh Town Council recently Mr. Whitson, convener of the Housing and Town-Planning Committee, moved approval of a recommendation of the committee that the erection of 1,000 houses be proceeded with at Lochend. The number of new houses to be provided on the Lochend estate in respect of slum clearances was estimated at 300 for the Cowgate-Grassmarket area and 400 for Leith areas. The Board of Health had required that 250 be two-apartment houses and 750 three-apartment houses. In all cases a scullery, bath, and other conveniences were provided additional to the prescribed number of apartments. The system of building was various forms of concrete, including duo-slab. He moved acceptance of tenders. Mr. Mancor moved that they delay the scheme until they obtained a financial report from the City Chamberlain as to the city's past and proposed commitments in housing. Mr. Hay moved another amendment that they only proceed to erect 500 of the cheaper houses. On a vote Mr. Whitson's motion was adopted.

PRINCES STREET BOULEVARD

THE proposal to form a terrace on the south side of Princes-street, between the West End and the Mound, came before Edinburgh Town Council recently.

Lord Provost Sleigh moved approval of the recommendation of his Committee for no action on the proposal. They had such a magnificent heritage in Princes-street, he said, that they would be failing in their duty if they did not give any proposal materially affecting Princes-street their most anxious and careful consideration. He had been unable to discover any good ground for urgency in the matter. Princes-street could not be said to require any widening at that part. The most urgent problem at the present time was to secure the removal of the steps in front of the Royal Scottish Academy at the Mound. If it could enhance the attractions of Princes-street they would not grudge the money, but apart from differences of opinion on that point it was well to bear in mind that in a time of financial difficulty they had a good many large schemes in hand—housing, removal of slums, and expensive road schemes. No doubt the scheme would employ a number of unskilled men, but a considerable proportion of skilled men would require to be employed. Even on the ground of unemployment, however, considering the other schemes they had undertaken, including the Edinburgh-Glasgow road, the terrace scheme could not be described as urgent.

Mr. Sawers, in seconding, said that they were asked to spend £50,000 unnecessarily.

Mr. Douglas Elliot said the strength of a chain was its weakest link, and the capacity of Princes-street was limited by the neck of Hanover-street. To widen the street west of that would be futile. The Lord Provost's suggestion that the steps should be removed was a step in the right direction, but it did not go far enough. The only thing to cure the situation was to remove the Royal Scottish Academy buildings altogether.

On a vote being taken, the Lord Provost's motion for no action was carried by 44 votes to 18.

At the end of the meeting notice of motion was given by the Lord Provost, seconded by Mr. Matthew White, that it be resolved to make representation to His Majesty's Government urging that immediate action be taken with a view to the removal of the steps in front of the Art Gallery at the Mound.

Housing Position in Scotland.

Mr. Stewart, Under-Secretary to the Scottish Board of Health, informed Sir G. M'Crae that the Board had approved, under the Act of 1923, the erection by local authorities of 6,820 houses, for 1,943 of which tenders had been accepted; 611 were under construction and 8 had been completed. As regarded private enterprise, the number of houses for which Certificate "A" had been issued was 1,779; 865 were under construction, and 29 had been completed.

Answering Lord E. Percy, Mr. Stewart said he thought something like 6,000 "Addison" houses were still under construction in Scotland.

Mr. D. G. Somerville: Is it not a fact that the majority of the "Addison" houses are under repair?—No answer was given.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of otland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors it may occur:—

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

. CXXVI.—No. 4237. APRIL 18, 1924.

THE NEW HOUSING PROPOSALS

THE outstanding merit of the new Report* on the position of the building industry lies in its psychology. It is not merely a collection of statistical tables; it is a direct and moreover a readable appeal to morale, and is designed to indicate the line of escape from "the longed depression in our industry which existed from about 5–6 onwards until 1914." To many it will appear unfessorial in that it suggests nothing novel, but relies upon operation, sensible administration, and good will to provide necessary machinery for what at first is only to be a slightly elerated output. In our judgment this reticence is a welcome lity. Housing statesmanship has too often been distorted ousing tactics; it has suffered like a patient who is examined a series of one-sided specialists, each bent upon diagnosing own favourite complication, while the general condition , still more, the vitality of the patient is forgotten. To-day paramount necessity is confidence, and this can only be ined through co-operation and good will within the industry. It is gratifying to find that the three internal parties—loyers, operatives, and manufacturers—have abandoned r own peculiar catchwords and sunk their differences to an nt sufficient to produce a report which has not only been ed at unanimously, but is also essentially practical. This nimity is of greater significance to the building trade than event of recent years. The industry holds a unique position; peculiarly intertwined with everyday life; it directly reflects onal prosperity, and is compelled to enlist the complete ut of social activities for its most minor results. Thus a ed building industry speaks with a national significance that ot be paralleled in the mining or even the railway world, the force of its utterance must therefore be far-reaching. requisite stabilisation of demand on labour and materials be provided by the adoption of a programme covering a d of fifteen years, the output expanding gradually year ear until the maximum annual production is reached in .

he Minister of Health has already signified the intention e Government to embody these proposals for a sustained ng programme into a Government Bill, but the measure not be easy to frame. Sir Kingsley Wood has pointed that it involves a financial resolution, amounting to a amentary guarantee, which must embody an agreed cost. e is also the complication of the local authorities and their ribution, and the need for amendments in the public and, enture to think, building interests. We have yet to see Mr. Wheatley proposes to meet the very real difficulties n are suggested by the new proposals, but we do urge that whole influence of the building world should be directed rds helping to find a solution of our present difficulties. s the fifteen years' guarantee is really adequate the Report ll the possibilities which it opens up become inoperative he detailed programme which it suggests ineffective. In g Parliament to embark on these uncharted seas Mr. tley must be sure of his course and of the force of opinion behind him. We have insisted on these important generalities because we recognise that the temptation to examine and criticise the details of the Report may prove so alluring that the foundations on which the structure rests may be taken too much for granted, and a great opportunity may thus be frittered away.

The Committee has found that the subsidy granted under the 1923 Act is insufficient to bring house rentals within the reach of the lowest-paid workers, and the Report concerns itself not with specific proposals as to the increase of that subsidy, but with the organisation of the building trade and its supplies that it may carry its future burden as efficiently and economically as possible. The three principal shortages are capital, labour, and materials, none of which can be overcome without the certainty of a stable and continuous demand. In regard to capital, the Committee desires to enlist "the enthusiastic support of every kind of private enterprise, so that employers will eagerly strive to participate in house building and in the training of the additional labour which is an essential condition of success"; it recommends that every procedure, voluntary or otherwise, should be simplified to that end. Local builders, labour, and materials are to be enrolled to meet local needs, and contracts distributed over the largest number of employers. The value of team work through the small builder is recognised, subject to a wide co-ordinating influence. The section devoted to the augmentation of labour is perhaps the most hopeful feature of the Report. The problem has been the stumbling-block of all past schemes and we have here for the first time an accepted plan of apprenticeship which would gradually supply the requisite number of skilled workers. It is based upon an agreed standard of wages and is an earnest that masters and men are equally honest in their desire to make good. The appendix containing the recommendations of the manufacturers is unexpectedly encouraging; production can, it appears, readily be accelerated to keep pace with the proposed programme, and we are told that special arrangements are being made to deal with the lead shortage. There is also to be a guarantee against exploitation of prices.

The general recommendations of the Committee resolve themselves, therefore, first into a guarantee of stability by a fixed programme; secondly, the creation of a permanent organisation to carry out that programme; and thirdly, the appointment of a Statutory Committee, to be established by law and entrusted with the general direction of the scheme.

Mr. Wheatley deserves our thanks and congratulations for having brought together the parties which have framed this Report, which we welcome, though with reservations; his task has, however, only begun. In so far as he can succeed in making the proposals effective it would probably result in a housing solution, but at a cost and under conditions similar to those we were only too familiar with under the Addison regime. If his proposals are carried into effect there would appear to be little hope for private enterprise of the past in housing while the effects on the building industry generally might give us stability of a kind, but would it be the kind of stability which would be in the best interests of the nation, to say nothing of the industry itself?

---

eport on the Present Position in the Building Industry. Cmd. Price 9 = net. H.M. Stationery Office. (*See also pp.* 650–652.)

NOTES.

Registration, the Institute, and the Society.

THE general lines of the terms of the draft agreement between the Council of the R.I.B.A. and the Society of Architects on the subject of Registration and the absorption of the Society are now more or less public property, and although the agreement of the Society is subject, we believe, to revision by the Society's legal advisers, we think it is a duty we owe to our readers to indicate the nature of the agreement so far reached. The outstanding issue of the negotiations is the proposed amalgamation of the two societies, the advantage of which to the profession as a whole will, we believe, be questioned by very few of those who realise how harmful to the profession in relation to the public has been the existence of two societies. In the effort to secure registration, a larger measure of public recognition, and many other matters affecting architects, the profession must stand in a vastly better position if served by one society, and such a result of the negotiations which have taken place would surely go a long way to cancel any misgivings which may arise in regard to details of the agreement.

The Terms.

BRIEFLY, the terms of the agreement between the two bodies are that Fellows of the Society will become Fellows of the Institute; Members of the Society to become Licentiates of the R.I.B.A., all of whom, with, of course, existing Licentiates of the Institute, will have full corporate powers, including the vote; Licentiates of the Society to be students of the Institute and students of the Society to be Probationers. Provision will be made for those Members of the Society who have passed the Society's examination to qualify for Associateship, on passing a special examination in design and all subjects not included in the Society's examination if they wish to do so. All Fellows, Associates, and Licentiates will be entitled to use the title "Chartered Architect" if they wish to do so, in addition to the R.I.B.A. affix. As these proposals entail alterations to the R.I.B.A. Charter and By-Laws, it is intended to ask the Privy Council to authorise additional alterations at the same time, which it is believed will facilitate the working of the Institute machinery, *i.e.*, to ensure a more adequate representation upon the Council of each corporate class; to effect continuity of the Council's policy by limiting the number of its members put up for re-election annually; and to enable important questions of Institute policy to be submitted to a referendum of all members in lieu of a general meeting in London only.

Future Intentions.

IF the proposals are finally passed by the Society, it is the intention of the R.I.B.A. Council to put them before the general body of members as the main issue on which the Council propose to take opinion of the electorate at the f coming R.I.B.A. election, and if vote indicates general support a me to confirm the agreement will be held the amalgamated body will take imm ate action to draft and to endeavo carry through Parliament a Registr Bill. If the proposals should be ca into effect the future membership o R.I.B.A. will number some 7,000 in of approximately 5,500 as at present

The Report on Housing.

THE Report of the mittee on Housing, we refer to in our le article, and a summa which we give on pp. 650-2, is an admi document in many ways, and is the not of visionaries, but of men who the building industry and the cri the situation; but for all that the R is not likely to be acceptable to al parties involved. The Report tak away from the political view of the tion, and gives proper consideratio the magnitude of the task and a re tion of the fact that the housing que is not one which can be disposed of hurry, as appears to be the view of of our politicians, but will, on the trary, be a serious problem for a time to come. But the machinery Committee propose to set up will no believe, be acceptable to Parliamen the country as a whole. While it is posed to hand over the machinery providing houses to the industry i financial assistance is to come fron Imperial authority and from the authorities, and we do not believe assistance will be given without co of the expenditure.

Private Enterprise.

THE possibilities inv in the Report need ca investigation. Two stand out prominentl the general stabilisation and imp ment of the building industry, an the production of working-class h Methods are described which may well lead to an improved industry we need some assurance as to the results. Is private enterprise of the to receive no encouragement? suggested that no one runs the risk employment but the working man? A many people would be glad to be as of an income for fifteen years. Dar all of us, demand this from the Go ment? Mr. Geo. Lambert writes the House of Commons that "no an of oratory can replace 200,000 me to the building trade in 20 years. 50 years of public education youth loafing at street corners and drawing whilst working men cannot get hou live in." This diminished supp labour can only be augmented and utilised to provide houses for worke means of private enterprise is Mr. bert's opinion. Someone has asked enterprise and incentive will be under the terms of the safe co-ope provided in the report.

Some Questions.

What a correspondent of considerable experience thinks of the Committee's Report will be inferred from following opinion expressed in a munication we have just received. rites :—" Are we to understand that Government proposals in regard to ing involve a kind of bargain between builders, building operatives and the rnment, in which all three parties to argain are to obtain a safe walk-over Government housing at what appears e the inevitable detriment to the est of the general public ? If the men are promised steady employ- t for, say, fifteen years, and builders ty of good contracts for the same d, only by a resulting rise in the price ilding of all kinds and by a positive rance to new industrial undertakings, going to be worth while even to the stry itself ? I am as sincerely ous for the well-being of a building ative as for his employer, but I gly protest against one class being lised for the benefit of another. On face of it it looks as though we were g to get housing by a remedy that even be worse than the disease. I for long vision, for keen and searching ight. We want houses badly, but want good wages too, and we want es we can afford to pay for, and if we get all, which shall we have ? It is ood making fine transport machines ss we can get efficient motive power raw them. Some people hoped that Land Act of 1909 would bring pros- us returns to the Government. We know that enough foresight was not wed on the scheme. Let us try to se what will be the effect of the pro- d scheme. We have heard a great about class legislation. We seem et little else. And the great body iddle-class population in this country, h includes professors, scientists, ors, lawyers, chemists, artists, and ers, who probably work harder in ortion to their incomes than any other , would be safer guides for class lation than aristocrats or working I do not misjudge those who are he top or the bottom of the social r, but the very difficulties which keep there lack the more evenly-balanced ment of the middle-classes."

---

e Rate of duction.

We must say that the need is obvious enough for a carefully guarded agreement such as will afford guarantee of fair returns in this aining. Only this week we were told a large employer that the rate of uction amongst our building opera- is often only a half of what it was re the war, and a test showed only bricks a day in straightforward ing. Then what are we to think of atmosphere which will surround all young men who are to be brought the apprenticeships to the building trade ? Will it be favourable to the creation of the best type of British operative ? The public had cause to feel proud of the British workman and it will be a bad day for us if they have to lose this good opinion.

Melrose Abbey. From a Sketch by Mr. William Harvey.

Unbuttressed Masonry in North Wall of Presbytery. Hidden Reinforcement now ensures the stability of the dangerously overhanging masses.

Waterloo Bridge.

When Mr. Taylor, of the County Council, tells us that it is a mistake to suppose that John Rennie "fixed on the present width of 42 ft. in order to be artistically right" and that "he did not think he had done so for a moment," he is probably right, though the argument by itself exhibits a curious confusion of ideas, as the inference drawn from it that the increased width will not affect the design of the bridge appears to us much mistaken. The architect would probably have received his instructions from others as to the width required and would plan his bridge of proportions to fit the dimensions given, and in order to be "artistically right" he could do nothing less. But it is a mistake to suppose that the being "artistically right" depended on John Rennie deciding the width himself. If he had been given another width he would have designed it for the width given. Mr. Taylor is probably right in supposing the architect did not impose the width in order to be right, but that supplied with the requirements he designed for them ; he is wrong in the inference, however, which he deduces from it that the artistic value of the present bridge will not suffer in doubling the width as required under the present scheme. Time only will show whether the increased width is an injury to the unity of the bridge as it exists at present, but though Mr. Taylor tells us that in a few years "it will almost be impossible to tell the difference," we do not think him right in this conclusion.

Melrose Abbey.

We publish on page 623 an account of recent repairs at Melrose Abbey, where the Historic Buildings Branch of H.M. Office of Works has not only been able to retain existing evidences in view while maintaining the stability of the building, but has revealed again other details that had been concealed by former less efficient methods of repair.

GENERAL NEWS

Fulham Town Hall.

The Fulham Council has postponed the proposed rebuilding of the Town Hall owing to the cost.

Rejected Lunettes.

Two of the rejected lunettes, which were originally designed for the London County Council Hall, are being placed in the booking-hall at Westminster Underground Station. The designs have been carried out by the students of the Westminster Art School.

University News.

Two Bartlett Exhibitions for students intending to join the School of Architecture at University College are offered for award this year. They are of the annual value of £40 a year, and tenable for five or three years according to the course. Applications must be made to the Secretary of University College, London, not later than May 30.

R.I.B.A.

We take the following notes from the minutes of the Council meeting held on March 31, 1924 :—

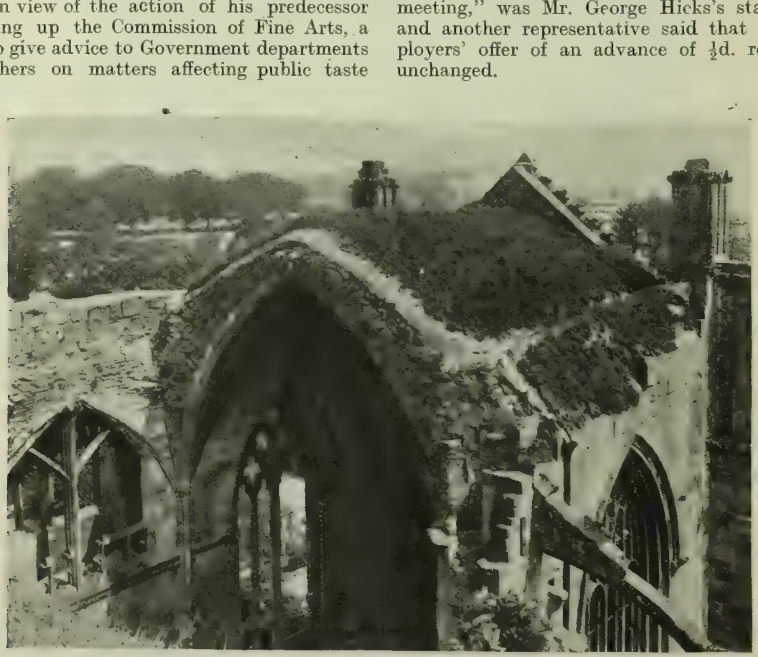
Restriction of General Building in Favour of Housing :—It was decided to approach the Ministry of Health and protest against any steps being taken to restrict general building operations in favour of house-building.

R.I.B.A. Street Architecture Jury :—Sir John J. Burnet, A.R.A., and Mr. Walter Tapper were appointed in place of Sir Aston Webb, P.R.A., and Sir Reginald Blomfield, R.A., on the Street Architecture Jury.

The Professional Classes Aid Council :—Mr. Paul Waterhouse (Past President) was appointed to represent the R.I.B.A. on the Council of the Professional Classes Aid Council.

The International Garden Cities and Town-Planning Federation Conference, Amsterdam, July, 1924 :—Mr. Raymond Unwin was appointed to represent the R.I.B.A. at the Conference.

R.I.B.A. Intermediate Examination, May.—The centres for this examination will be London and Leeds. At both centres the examination will be held on May 23, 26 and 27. At the London centre the oral examination will be held on May 29 ; at the Leeds centre it will be held on May 28.



Ugly Official Designs.

In the House of Commons Mr. Sunlight asked the First Commissioner of Works if he would state, in view of the action of his predecessor in setting up the Commission of Fine Arts, a body to give advice to Government departments and others on matters affecting public taste of artistic value, why it was left to an outside private person to call the attention of this commission to the ugly cast-iron design supplied by the Office of Works for the 40,000 telephone kiosks about to be set up at street corners by the Postmaster-General's Department, with the result that fresh designs had been obtained from outside architects of repute ; and would he instruct the officials concerned in future to consult that body as fully as possible.

Mr. Jowett said the hon. Member was under a misapprehension. Telephone kiosks were not provided by his department, but by the Post Office, and the design to which he referred was not made by his department, nor had it in fact been adopted. He did not understand the statement that it was left to an outside private person to invite the attention of the Fine Art Commission to this matter, as it was his department which originated the proposal, in which the Postmaster-General had unwillingly concurred, that the advice of the Commission should be obtained.

Building Wages.

The negotiating committees of the National Federation of Building Trades Employers and the National Federation of Building Trades Operatives met recently at the offices of the former organisation in Bedford-square for the purpose of giving further consideration to the operatives' claim for an advance of 2d. an hour on the present rates of wages, which vary from 1s. 8d. per hour in London to 1s. 7½d. and 1s. 7d. per hour in the provinces. On two previous occasions the claim was considered by the National Wages and Conditions Council, and it was subsequently taken up by the federations, and as an outcome of the negotiations the employers, while maintaining that the present wage rates were adequate, offered ½d. an hour advance. This offer proved unacceptable to the trade unions, although it has been stated in certain quarters that an advance of 1d. an hour might receive favourable consideration. A factor in the present situation is that the Liverpool building employers have rejoined the National Federation, and have given notice to local operatives that the higher rates paid there end on April 30, when Liverpool comes into line with other parts of the country. The negotiating committees sat for three hours, and at the adjournment at six o'clock it was admitted that no progress had been made in the direction of a settlement. "The position does not seem to be appreciably altered since the previous meeting," was Mr. George Hicks's statement, and another representative said that the employers' offer of an advance of ½d. remained unchanged.

CORRESPONDENCE

Restoration of Ruins.

SIR,—Having for long tried to use the li influence I possess in trying to get the pow that-be to abstain from the restoration of ru it was with considerable pleasure that I r the letter signed "The Correspondent" your April 4 issue, which everyone probably agree with who recognise that definable something in a ruin we call charm

When will the difference between a d building, "Whitby Abbey," and a live " "Westminster Abbey," be properly underst by those entrusted with the reparation ancient buildings ?

"Delay the ruthless work awhile. O sp
Thou unpiting demon of repair,
This precious relic of an early age.
More fatal is thy touch than the full rag
Of warring elements ; yon ancient wall
Better to see it tottering to its fall
Than decked with new attire with lavish co
Form, dignity, grace, proportion—all lost
How many a sacred pile in this fair land
Touched and retouched with some unh
hand,
A modern gait incongruous wears,
Veiling the venerable form of years ! "

"It was a pious work, I hear you say,
To prop the falling ruin and to stay
The work of desolation ; it may be
That ye say right, but, O, work tenderly
Beware lest one worn feature ye efface—
Seek not to add one touch of modern grace
Handle with reverence each one crumbl
stone,
Respect the very lichens o'er it grown,
And bid each ancient monument to stand
Supported e'er as with a filial hand."

C. F. THOMPSON, F.R.I.B.A

COMPETITION NEW

Bradford Masonic Temple.

The scheme for the new Masonic Temple been withdrawn from public competition.

Other Competitions.

Other competitions still open include following (the dates given are, first the sendi in date, and second the issue of *The Builde* which full particulars were given) :—Indust Designs (June ; Dec. 21, 1923). Natic Theatre (April 26). Ross-Smith Memo (Sept. 30 . Feb. 1). Salford Baths (April April 4). Glasgow Public Hall (July 4 ; April

Lambeth Bridge.

The Special Committee of the House of Lo the Marquis of Bath presiding, which has the London County Council scheme for construction of a new Lambeth Bridge u consideration for several days, recently cam a decision favourable to the Bill, on condi that certain modifications should be mad to the headway of the central arch. For promoters Sir. L. Macassey said the br would be an artistic structure not unwo of its position. The bill has yet to come be a Commons Committee.

Books Received.

MELROSE ABBEY

AN INFORMAL VISIT

By WILLIAM HARVEY

desirability of preserving genuine relics iquity has been kept before the public century by the writings of several s of the Romantic school. Byron, ng at the outset how disastrous "resto- " might become if the demolition of old were to be permitted, condemned it in e in a few witty lines in his "Don Juan," his prophetical foresight seems to have gnored by the enthusiasts of the Gothic al. Peacock delighted to portray his and heroines inhabiting restored castles beys, but slyly declined to identify him- tirely with the tastes of the fashionable he described. Sir Walter Scott, more urous and more romantic, riveted atten- pon Melrose Abbey with his metrical to the midnight visitor, and at the time established the claim of the build- be considered a thing of beauty even in mantled and ruinous condition.

nks to the glamour of moonlight and the of a great name, the ruins of Melrose become familiar in pictures to all the h-speaking world, and form a centre of ion for thousands of pilgrims from all ds of the earth, as well as a subject of o the inhabitants of the adjoining towns llages. To all of these it is a matter y real moment that the historic frag- of the Abbey church and its monastic gs should be preserved not only in rally sound condition accessible to the but that their old-world charm should dissipated by the adoption of any ill- l methods of repair.

what methods should be so described s upon personal opinion to some extent, an attempt to fathom certain contradic- iticisms I visited Melrose, armed with horitative permit to inspect and obtain information that could be given me on t. Works of repair are still proceeding, lthough a great deal has been done, remains untouched by the present ators to allow of comparison with the of former custodians of the building. as to be expected, perhaps, in a ruin as been made world-famous by such special notice from the Wizard of the North, evidences of former repairs were to be seen on all sides, and those who love to see ivy growing on the tops of ruined walls need not lay the blame (?) of clearing it away upon H.M. Office of Works. A good deal of vegetable growth had already been hacked away, and the historic architecture of the ruin was no longer disguised by a tangle of briars growing in a stone heap. But though the living screen had been stripped away, another and far less beautiful screen of cement rendering had been reinstated in its place before the building was handed over to the care of the Government. Viewed from the roof, the ruins presented, at the time of my visit, something of a patchwork appearance. Repairs had been completed in some places, were in progress in others, and in some parts had not yet been commenced. The old cement-covered masses of masonry were anything but satisfactory, their slick surface and greasy-grey colour contrasting most unpleasantly with the beautiful and varied tints of the stonework. From the point of view of endurance the cement coating could not be considered efficient, since it had been cracked by movements in the structural masses and was allowing rain-water to enter the walls almost as freely as before its application, although in concentrated streams in place of diffused drops. The remaining vaults of the building had been treated with a layer of concrete intervening between the old voussoirs and the cement rendering, and had been externally covered with a layer of turves. In response to the wishes of those who love to see herbage associated with ruined walls, the grass is being allowed to remain on the high vaults for the time being until a decision is arrived at concerning the fittest treatment for this part of the building. The disadvantages of grass should be obvious, since the turf forms an ideal seed-bed for the nourishment of other weeds still more destructive than itself, whose rootlets soon penetrate the surface of the concrete and infallibly burst it apart as they swell and grow. The turves were secured upon the sloping extrados of the vault by means of a number of iron pegs projecting from the concrete covering, but even this extraordinary device fails to disguise the ugly cement which remains exposed at the edges and betrays the artificiality of the scheme.

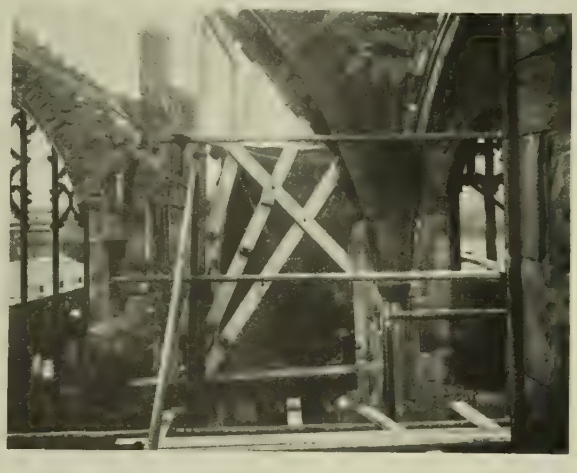

FIG 2.—OVERHANGING MASONRY IN EAST WALL OF SOUTH TRANSEPT, NOW RETAINED IN POSITION BY CONCEALED REINFORCEMENT.

Another detail of former repair, which was neither sound nor sightly, was the use of exposed iron tie-bars to restrain movements in masses of masonry subjected to arch thrusts or other overturning loads, but which had been deprived of their proper buttressing by the decay and fall of adjoining masses originally intended to absorb the pressures and afford lateral support.

Exposed ironwork on a ruin is more dangerous than in an inhabited building, in that it is generally less accessible to inspection and the very necessary periodical repainting to preserve it from rust. Its expansion and contraction under alterations of temperature also affects its efficiency, since they permit of slight repeated movements in the masonry which tend towards its ultimate disintegration. One section rusted through until its section is reduced beyond a certain minimum can throw the whole apparatus out of order.

In contrast with the old order of things, the new repairs looked admirable.

The unpleasant coating of cement, having shown itself to be inefficient and superficial as well as ugly, had been removed, and the old masonry, both ashlar facings and rubble core, were brought to light again.

Water had been excluded from the wall-tops by a special process, in which all masons

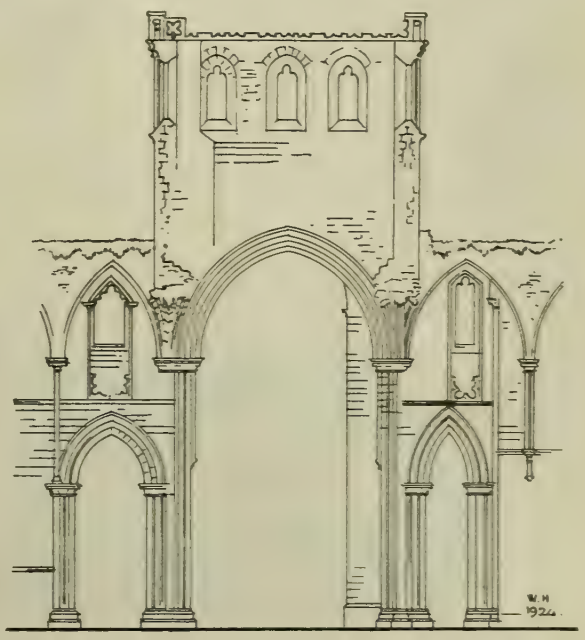
View of Presbytery and part of North Transept of Melrose Abbey from the North.

he Historic Buildings Branch are trained. dirt is first raked and washed out of the s, and the space grouted up with rich ent-mortar, which is tamped in hard and well back from the surface. This con- ation process is followed by pointing with ortar composed of lime and washed pebbly for general surfaces, or of Portland ent and sand with a waterproofing mixture wall-tops. Appearance and efficiency are roved by spraying the joints with water the initial set, and the mortar is made dhere to the stonework far better than d be the case if allowed to dry as it set. spraying also brings to the surface the er grains of sand and small pebbles, and rs the newly executed work to take its e beside the old rain-worn work without ing an inartistic discord. Where common e demands that hollows in the rough core ld be made up to throw off water, a few rough stones of similar character, obtained among the fallen débris on the site, are in, and the pointing is arranged in such anner that the rain is conducted to spouts thrown clear of the building. At Melrose ey this method of repair shows up the and varied tints of the different local es composing the core of the walls (see h, Fig. 4). The success of this process of iring walls with a minimum of alteration is harked contrast with the former methods atching with conspicuous new material or smears of superficial cement; but, like y other good things, it has been adversely ised on occasion even by persons well ainted with the disgusting appearance of old cement coating (Fig. 5). Possibly a natural desire to put a Government depart- in the wrong may have had something o with the objections, and the method inly needs to be carried out by extremely trained and competent masons acting r efficient and sympathetic direction if best results are to be obtained. Granted it is desirable to preserve a monument the least possible alteration consistent its safety and endurance—and this pro- seems to be the principle underlying all s undertaken by the Historic Buildings ch—it seems that the method of conserv- he existing rough core is almost as im- nt as maintaining the ashlar, mouldings, carvings of a building. All parts indicate ays and thoughts of the original builders. bear evidence of systems of structural ce which were consistent and effective in own fashion, though expressed in for- differing from those in use at present. ughout the ruins of Melrose Abbey are al instances of the combination of con- tion as just described, with special de-

Fig. 3.—Vaulting of presbytery formerly concealed under a thick coating of Roman Cement.



vices to meet more urgent needs. Masses of masonry projecting from wall-tops and unbalanced arch thrusts were producing movements which, unless restrained, would have overturned the remaining pier on the N. side of the presbytery and the N.E. pier of the S. transept. The old iron bars which had been applied to the external faces of the walls, to the great detriment of the appearance of the ruin, had conflicted in line, colour, and constructional sentiment with the Gothic work. They were therefore replaced with internal tensile members properly protected from the weather in cement concrete beams embedded in trenches cut in the internal rubble core of wall-tops and in the floor of the wall passage.

The beams were constructed of sufficient length to bridge the fractures in the masonry and tie in the parts which threatened to move and fall, and to anchor them to masses of ample size and solidity to withstand their pull, at any rate for a very considerable period.

The overhanging masonry at the wall-top of the S. transept was anchored back with seven 1-in. diameter mild steel bars in a beam of one square foot sectional area let into the

Fig. 4.

wall-head, and covered with masonry on all sides and the top. Great care is taken to keep the metal protected, and in this instance it was possible to arrange for at least 9 in. of masonry between the concrete beam and the external air.

The ends of the rods and of the beam were turned down into pockets sunk for them in the internal core of the old walls to ensure a thorough grip on the material and hold back the overhanging portion to the solid work. The overhanging masonry was upheld temporarily upon shoring erected from the end of a 13 in. by 13 in. baulk of pitch-pine laid cantilever fashion in the wall passage of the clerestory, and the reinforced concrete beam was calculated to restrain some part of the northern thrust of the remaining south transept vault as well as the overhanging mass of masonry.

Some vaulting which remains over the chapels of the south nave aisle was in process of treatment. The shapeless concrete pad which had been placed upon the upper surface of these vaults is being removed, and the vous-soirs treated to a process of cleaning, tamping, etc., already described.

A low barrel vault over the sacristy had also been consolidated in this way, and harmonised admirably with the general masses of the ruin. What it must have looked like when covered with a dismal and formless mass of rendering was realisable from the appearance of parts of the building still remaining to be treated.

Excavations in and around the old cloister garth have resulted in the discovery of foundation walls of some of the monastic buildings, including those of the once vaulted undercroft of the dormitory, which had been divided into two manageable spans of about 12 ft. apiece by a row of short pillars. Adjoining this building is a finely preserved walled-in watercourse of the twelfth century. Its parallel retaining walls are constructed of a facing of small wrought ashlar facings backed by rubble core, and have each two courses of projecting footings splayed on their upper edges. The watercourse seems to have gradually silted up in use until the bed of the stream was filled with gravel and mud to the height of the top of the upper projecting course, and then to have been paved with whinstone cobbles. A wall parallel to the drain on its southern side has been identified with the position of the reredorter which would have had its cubicles overhanging the stream. This drainage system indicates a reasonably efficient state of sanitary science of which further evidence was discovered in the foundations of a lavatory building in the cloister garth placed near the (supposed) position of the refectory so that the monks might wash for meals. This was a particularly necessary operation in days when West and East alike agreed in using fingers instead of forks, and the provision of an ample water supply indicates that although the old system may have differed from ours, folks in those days were neither so unhygienic nor so uncivilised as we are sometimes led to believe.

Reinforced Concrete Hotel at Barcelona.

ARCHITECTURAL SOCIETIES

HANTS AND ISLE OF WIGHT ARCHITECTS' ASSOCIATION.

A meeting of members of this Association was recently held at the Guildhall, Winchester. Sir William Portal, Bart. (President of the Association) presided, and a brief address was given by Mr. C. H. Lawrence, A.R.I.B.A., Past President of the Bristol Society of Architects, followed by a lecture by Mr. C. H. E. West, F.S.I., F.R.G.S., entitled "Beauty in Arts and Crafts, and English Mansions."

Sir William Portal, alluding to Mr. West's subject, said he specially commended to Mr. West two Hampshire mansions which led in historic interest and in beauty. The first was The Vyne, near Basingstoke, dating from Henry VII, which still had what Horace Walpole described as "the most heavenly chapel in the world," and its original glass, which mercifully had never been restored. Then there was the noble house, still more splendid, but of later date, Bramshill. That was a house one never forgot, which had now become mellow and rich, and it had been built for the elder son of Prince Henry, elder brother of Charles I. As regarded instances of the Adams' style in Hampshire, he did not think the work at Broadlands, the seat of Colonel Wilfrid Ashley, could be beaten, for the rooms there with Adams' decoration were second to none. He reminded the audience that what was known as the Adams vogue or style lasted for a considerable period, both before and after the lives of the Adams, and therefore it was not only to be found in connection with the brothers Adams personally, but in connection with the whole period with which the vogue was associated. There was a splendid instance in London which had nothing to do with the brothers Adams in the parlour of the Bank of England. One thing interested him very much. They were to see some pictures connected with Worcester Cathedral, and he recalled a circumstance not generally known, that a great deal of the stall work and panelling, which formerly separated the choir and aisle at Worcester Cathedral, came into a Hampshire house, and decorated the reception rooms of Crawley Court. This came from Worcester as the result of a condition for its removal imposed upon the Dean and Chapter by an otherwise generous and munificent benefactor, who did a great deal for the fabric of Worcester Cathedral.

Mr. Lawrence addressed his remarks particularly to the members of the Architects' Association, and said that in the alliance between the Royal Institute of British Architects and the Architects' Associations throughout the British Dominions they had something which was unique, and in its sphere all-powerful. He impressed upon the Hampshire and Isle of Wight branch that they were indeed part of a great organisation, and if the members so spread about over a large area and in different towns would come together and do their bit, the Hampshire Society would be one of the stro and most powerful Societies in the provin

Mr. West then gave his lecture, illustrat a series of nearly 200 photographs. Fe of the lecture were the various objects of the London Museum and the Victoria and Museum; the carving in Worcester and He Cathedrals; and, finally, some interior vie a modern mansion in Grosvenor-s London, W.

At the close, the lecturer was cor thanked by the President.

EDINBURGH ARCHITECTURAL ASSOCIATION.

On April 12 the Edinburgh Archite Association held their first excursion season, when a visit took place to the a Parish Churches of Kirkliston and Dalme the county of Linlithgowshire, under the l ship of Mr. William Davidson, who read a (giving the history and describing in det churches) which was illustrated by large plans.

In the course of his remarks Mr. Da said that Scotland had apparently always her money on education, and during the building periods of the Middle Ages had been able to compete with the great build France and England, but he considere a Norman gem like Dalmeny could not be too highly for its scale detail and pur design. He considered that most auth were rather early in the dates which assigned to those buildings, but he would h to contradict such eminent authorities Ross and Mr. Macgreggor Chalmers.

Most people seemed to assume tha Normans began to build cathedrals, abbe churches as soon as they landed, but he sug that it must have taken some time to ov such fierce and warlike people as the Bri that period.

The lecturer then contrasted the w Dalmeny and Kirkliston with work of th period on the Continent and England, a it was his opinion that according to th given by documentary evidence for the w Ely, Durham, Norwich and other E examples the work at the two churches review could scarcely be earlier than late century. The view of the interior of D from the west gallery looking into the and apse, through the two Norman arch he stated, the most picturesque compos had ever seen in a parish church of the He was glad that Scotland's poverty ha those gems of ancient Scottish art fr devastating hand of the Victorian restor stated how much England had suffered hands of Sir Gilbert Scott, who had m 17 cathedrals, several abbeys, and sc parish churches in England, in the n restoration. At the close of the visits Inch Morrison, the President, thank rectors and Kirk Sessions for their cou giving facilities to see the churches and M Arnott, F.R.I.B.A., proposed a vote of to Mr. Davidson for his interesting and tive paper.

Change of Address.

The Executive of the London Associ Master Decorators has taken new office Victoria-street, Westminster, S.W. 1. of the retirement of Mr. A. Davidson, M Wall has been appointed Secretary, to w future communications should be ad Mr. Wall will be pleased to answer any i relating to the Association, working co rates of wages, &c., to place any di experienced by members before the E for its consideration. The new telephone is Victoria 7399.

R. J. A. Gotch (President) took the r on Monday, at 9, Conduit-street, at rdinary general meeting of the Institute.

R. Keen (Hon. Secretary) announced decease of Mr. William Frowde Young, ed Fellow 1904; Mr. Joseph Clarkson dison, elected Fellow 1887; Mr. Thomas cis Tickner, elected Fellow 1907; and Arthur Edward Northcote, elected Associate . It was resolved that the regrets of the itute for their loss be entered on the minutes that a message of sympathy be conveyed heir relatives.

Modern Dutch Architecture.

R. D. F. Slothouwer, in the course of a r on "Modern Dutch Architecture," said influence of the architecture of England and and had been reciprocal. The influence of English domestic architecture in the begin- of this century was so strong that those were the younger Dutch architects would indebted to England all their lives. When egan to study architecture at the Technical School of Delft in 1901, the names of many ish architects, such as Ernest Newton, in Lutyens, C. F. A. Voysey, and Baillie- were dearer to them than the glorious h names of the past. In 1905 some of them to London and visited Surrey and saw ality some of the houses which they knew ll from the pictures. Of monumental build- they were most struck with Westminster edral. They had no eyes for the so-called ic style. The neo-Classic had been dead in nd since about 1880, and most of them now come to the conclusion that it had been really alive. The revival of the olic Church and the romantic feelings of the period of the last century caused a revival e Gothic, and this movement was for the er part due to an architect of undoubted s, Dr. P. J. H. Cuypers, who created the museum at Amsterdam. Some years later, own Museum was designed by Mr. Weiss- in a purer copy of Dutch renaissance; his building had never played any rôle in evelopment of Dutch architecture, princi- because in the nineteenth century the to build in a historical style had gone. was caused by the change in the general in Holland between 1880 and 1890. The e longing for a new beauty filled the air hope of its coming. It was to be a new al beauty, where all the arts should work ner, for there was born a hate against duality. Out of this intense longing the tyle should be born. It was about 1900 the young architect, Berlage, was com- ned by the Town Council of Amsterdam ld the new Exchange. The effort made by rchitect in erecting this building, full of haracter, was difficult to understand in greatness. The principal aim of the ect was that the purpose of the building be expressed in its form, and that, if ood materials were used in the right way ulfilment of this condition was enough te a work of art. If this were the whole truth it was certainly illogical to ornament this building with a tower. The great impression the building made was certainly due more to the talent of the architect than to his theories. To a certain extent the Gothic traditions were continued in the Exchange building. The materials were used in their simplest form, for the beauty was more found in the proportions and character than in the detail. The enormous value of the deed of Mr. Berlage was the simplification and purification of their architectural feelings, and the general interest it had awakened for architectural beauty and architectural problems in general. Although the strong and simple principles on which this architecture was based would have seemed to have made it probable that Mr. Berlage would have formed a school, this had not been the case. A contemporary of Berlage who was much admired was De Bazel, who died last November, just when he had made his first monumental building—a large office building in Amsterdam. The charm of his highly distinguished and refined architecture was unmistakable, and he had made remarkable things in decoration and furniture. In the years from 1900 to 1910 it seemed as if the general lines of the future Dutch architecture had been traced by these two men, and that they were waiting for the young architects of talent who would build further on those principles to bring the new architecture. It had not been so, although their influence had been enormous, and Mr. Berlage certainly was now the most celebrated architect in Holland. The reaction had been intense, and it came in 1910 with the erection of a new head office of the centralised shipping societies—the so-called Shipping House. It was designed by Van der Mey with the collaboration of two younger artists of talent, De Clerk and Kramer. It was like the Exchange of Berlage, a milestone in the development of their architecture. The greatest contrast to the architectural ideas of the decade before lay in the adoration of phantasy. It certainly was a consequence of his philosophical ideas on architecture which made phantasy impossible to Berlage. Without phantasy life seemed a little tiresome. Therefore phantasy, so long neglected, took its revenge. And it must be said in a splendid way. Nothing, not the slightest detail, not even the material itself, was forgotten by her. Their celebrated old brick got a new size. The most admirable quality of this building was the unity of the whole, although many artists had collaborated This unity was the more remarkable because the spirit was quite new for the Holland of those days. The influence of this building had been enormous; not only had the architects who collaborated done important work themselves, but also an enormous number of satellites had tried to follow in their steps. De Clerk died last November at the age of 39, and De Bazel died in a railway carriage when travelling to attend his funeral. The work of De Clerk was considered by the younger Dutch architects as the most general work done in later years. He made all the drawings and even the general details himself, and it could not be otherwise because almost every detail was nearly a new invention. He could never teach pupils because every new day was really new for him and brought the possibilities of unknown beauty. In his earlier work he only made ornamental façades. He began by drawing for contractors, and it was only since the war that in the building of the workmen's houses, with the support of the State and Municipalities, that he got the opportunity to develop his enormous talent. The Director of the Housing Department in Amsterdam, Mr. Keppler, was the man who put his work in such able hands. In his earlier work his plastic talent was shown principally in the details, but when he saw the possibility of grouping his buildings, and even different parts of the buildings, his great plastic talent came to development. Proceeding, the lecturer showed some of the work of Luthman, Rutgers, Staal and Vorkink which, he said, might certainly look strange, but showed great talent. Instead of the romantic fairy-tale houses where every detail seemed to keep a secret, there had now come again the great flat surface and the silence. Mr. Slothouwer showed some of the municipal buildings at Hilversum, by Dudok, and also examples of the work of Wils and the associated architects Bijvoet and Duiker. He also exhibited slides of the work of the Amsterdam Office of Public Works under the direction of Hulshoff who, he said, had formed a staff of very clever architects all working in the modern spirit. In conclusion, he exhibited a series of slides of the older buildings of Amsterdam.

Discussion.

Mr. E. Warren, in moving a vote of thanks to the lecturer, said they had to thank Holland for one of the best Kings they ever had, who brought them a fashion of Dutch architecture which was still very marked in this country. They had the Dutch type of house with them to-day, and within the last 50 years there had been a strong revival of what they called the Dutch manner in England. It always struck him as curious that having imposed the fashion on England the Dutch seemed to have deserted it themselves. Every Englishman who went to Holland was struck with the beauty of the architecture of the seventeenth and eighteenth centuries. It was fifteen years since he had been there and therefore was not familiar with the new manifestations of architecture which had been shown them. He agreed that they had courage in the real sense, for they had made more courageous departures from all accepted rules than anywhere else in Europe. If they went on they would really arrive at what they wanted. Some of the things they had seen struck him as fine but he would reserve his opinion, as to some of the windows and doorways, till he had seem them.

Mr. H. M. Fletcher, in seconding the motion, said they must all have been surprised at what they had seen, but they had sufficient breadth of mind to realise that it was the work of young men who, if they retained their enthusiasms, tempered with greater experience and greater reverence for the work which had gone before them, would succeed. Although they thought they had left all tradition behind them, yet really they had not. It was all Dutch work—they could not imagine those buildings being erected in any other country. Holland was a country which had a great brick tradition behind it, for the extraordinary feats they had demanded of the bricklayer could not have been carried out in any country whose tradition was not based on brickwork. The brickwork was laid vertically, which could only be justified on the ground of phantasy. There seemed to be nothing they did not ask the bricklayer to do; or which the bricklayer was not capable of doing. They were ready to throw aside all tradition and logic with the desire to do something new. They must not blame them for that. They had not the courage to do such things themselves, but it was refreshing to see it in work for which they were not responsible. One felt that in time this new work would settle down into the landscape. There were, of course, some things shown which they could not accept and he did not think the lecturer expected them to.

Mr. F. R. Yerbury said that in Bedford-square they regarded Mr. Slothouwer as a sort of centre party in the architectural profession in Holland, and he was sorry they had not seen some of his work. Certain of the modern Dutch architects had deliberately turned their backs on tradition. Several of them told him they admired the old work tremendously, but it was out of place to-day.

Others who took part in the discussion were Mr. G. Jenkins, Mr. Alwyn Lloyd, Mr. G. R. Farrow, Mr. T. L. Dale, and Mr. W. T. Benslyn.

Mr. Slothouwer briefly replied and pointed out that the past styles of architecture had never been the styles of the people; but styles invented by those who had not been in contact with the people.

ILLUSTRATIONS

New Premises, Hull.

The scheme consists of billiard and reading rooms, lecture hall with provision for cinema and teas, demonstration room planned on the amphitheatre principle, board room and superintendent's residence. Arrangements for future extension are workshops and cottage homes, with space provided for a pergola for use in connection with garden parties. The façade is designed in the Tudor style, multi-coloured sand stocks being used in the facing with Bolton Wood stone dressings and green Westmorland slate roof. The design was placed first in a recent limited competition. Messrs. Horth & Andrew, AA.R.I.B.A., are the architects.

King Edward VII Memorial Hospital.

This hospital is built in the Rivelin Valley, about four miles distant from Sheffield on a beautifully wooded slope facing south. The accommodation is for six wards, each of twenty beds. Each ward has an open verandah, on which the beds can be brought out. The nursing staff is accommodated over the central administrative block. There are dining and sitting rooms for sisters and nurses. There is a separate operation department with cast room and X-ray rooms attached. The kitchen quarters and boiler house are to the north, the former leading off the main corridor. The whole of the facing stone was quarried locally and the ashlar stone came from Eyam Quarries in Derbyshire. The contractors were Messrs. Thos. Roper & Son, Sheffield; heating, Brightside Foundry and Engineering Co.; lighting, Thos. Ashton; and flooring, Kleine Flooring Co. Mr. A. W. Kenyon, F.R.I.B.A., is the architect.

The Carlton Club.

Our illustration shows the new Portland stone façade to the Carlton Club, which has recently been completed from the design of Sir Reginald Blomfield, R.A. Messrs. Trollope & Colls, Ltd., were the builders. To mark their appreciation of the expeditious and satisfactory manner in which the work was carried out, at its completion the members of the Club entertained the whole of the workmen engaged on the work to luncheon.

New Premises, Regent-street, Weston-super-Mare.

These premises are now nearing completion. The old dwelling houses on the site, which were set back from the present building line, have been remodelled and three shops added with additional housing accommodation above, forming a new street frontage. Local bricks were used, cement rendered and finished with "Lapidosus." The shop fronts are of oak.

Messrs. Ball & Pope, AA.R.I.B.A., are the architects; and Messrs. Dunthorn, Ltd., of Glastonbury, are the contractors. The amount of the contract is £3,300.

Houses at Weston-super-Mare.

The house and bungalow, which were recently completed, are situated on the hill-side facing the sea. The materials used are local bricks, cement rendered and roughcast. The roofs are covered with russet brown asbestos tiles. The windows are Crittall's standard steel casements. Messrs. Ball & Pope, AA.R.I.B.A., are the architects; and the contractor, Mr. Chas. Geeve.

"The Spirit of the Rocks."

This sculpture figure has been specially designed and modelled by Mr. Francis Doyle-Jones, A.R.B.S., for the Building Exhibition, to demonstrate the possibilities of cast-stone as a medium for architectural and sculptural expression.

The material used for the casting of the work was crushed Cornish granite and "Atlas" white cement, the surface being afterwards washed over with an acid solution and wire brushed, to remove the film of cement and reveal the texture and sparkle of the aggregate.

As becomes the subject, the treatment is simple, broad and eminently granitic; while the strong static quality of the design conveys a sense of the permanence and immutability of nature's own rock formations.

The casting of the figure with its plinth of similar material, afterwards mason finished, has been carried out by Messrs. Emmerson & Norris, Ltd.

OBITUARY

Mr. Charles Johnston.

Mr. Charles S. S. Johnston, a leading Edinburgh architect, died at his residence, Ernestone, Boswall-road, Edinburgh, on April 3, aged 74. He was the third son of the late Mr. James Johnston, of Coubister, and was born at Orphir House, Orkney, March 11, 1850. Educated privately and at the Grammar Schools of Kirkwall and Aberdeen, and the Glasgow School of Art, Fellow of the Edinburgh Architectural Association, Mr. Johnston started business on his own account in 1879, before which he had been for four years in the office of the late Mr. David Bryce, R.S.A., the eminent Edinburgh architect. He was a member of the 1st Lanarkshire Volunteers from 1866 to 1870; a member of the Trafalgar Lodge of Freemasons, No. 223, since 1883, when he was appointed to the office of architect; a director of the Edinburgh City Mission since 1884; member of the Lothians and Berwickshire Yeomanry from 1892 until the beginning of the war, when he joined the National Reserve; one of the architects employed to survey the City of Edinburgh during the war; member of the Edinburgh Botanical and Natural History Societies. He married in 1879 Elizabeth, daughter of the late Major-General William Gairdner, C.B., Bengal Native Infantry, and is survived by his widow, three sons and three daughters. Mr. Johnston was buried in Warriston Cemetery, Edinburgh, on April 7. Among his principal works may be mentioned Leith Sailors' Home (by competition); Guthrie Memorial Church, Edinburgh (competition); West Fife and Loanhead Infectious Diseases Hospitals (competition); Pollok Castle, Renfrewshire, restoration; Bemersyde; Grindaly, Orkney; Orphir House, Orkney, additions; Red House, Stromness; Orphir Free Church; Kirbuster School, Orphir; bungalow in India for Surveyor-General Bannerman; Barguley, Newton Stewart, for the Duke of Bedford; Glencaird, Monybuie, Bathmore, St. Andrews; Corsewall, Stranraer; houses and cottages in Callender for the late Mr. Ainslie, of the Gart; Criaghlaw, Wigtown; Corsock, Kirkcudbright; Glengorm Castle, Skye; Drums and Ormsary, Dumbarton; extension of the Crawford Gallery in Kilbirnie Church; Woodside, for the late Mr. Cochrane Patrick; Bannochar, Renfrewshire, for Sir Charles Renshaw; Bardrockwood, for the Duke of Bedford, &c.

The death of Mr. Francis Easto Banham, of the Grange, Beccles, took place recently at the age of 62 years. Mr. Banham's name is connected with St. Benet's Minister, of which he was the architect.

EXHIBITION NOTES

THE FINE ART SOCIETY.

THE show of pictures and sketches by Jo Farquharson, R.A., at the Fine Art Society proved very interesting. Though we do not for the artist's very green garden, we feel he has known how to paint vividly and wel hillsides of Scotland; in some cases he has admirable pictures of them, even where he given no mystery or imaginative concep Two or three snow scenes, perfect of their and much vigorous painting of Scottish scen made an excellent exhibition.

THE ALPINE GALLERY.

Just exactly why the works of four y artists have been exhibited at the Alpine Ga we cannot understand. Most of the subj as well as the way in which they are depi are repellant. "Les Deshabilitées" n conceivably be of interest as a subject, fo form of a woman often discloses fresh char those who admire the female figure, but su as here depicted, there is nothing to attract the most ardent admirer of the nude—ne good form nor colour nor movement. Then squalid interior such as is represented in anc drawing, there may be some aspect of str form or character, of light and shade or co which makes an appeal, but in the pi referred to the clumsy dancers or half-dru figures can surely give no pleasure. The a good piece of colour in "African Silence," Jan Jutu; some fine characters in his re pencil portraits, a pleasant pastel of an "Afr Homestead," and some vigorous portrait chalk drawings by Hyan Myer, but the ex tion as a whole leaves an unpleasant impres which does not necessarily mean that these c young artists may look upon the whole s day in its pleasanter aspects.

House at Bury. MR. J. D. MOULD, F.R.I.B.A., Architect.

Pair of Flats, Kendal. Mr. Geoffrey Morland, A.R.I.B.A., Architect.

[This pair of flats is also shown on drawing as a block of four flats. The contract for the pair was signed on April 24, 1923, and they were tenanted on September 12, 1923. In execution the coal places were made a separate building, and the hoods over the two doors, string course and plinth were omitted. Materials: External walls, 21 in. local rubble limestone; roofs of green Westmorland slates; windows, Hope's standard steel casements; maple flooring in two living rooms. The cubic capacity works out at 18,191 cub. ft., and the contract price was £850. The exigencies of the site necessitated a blank wall along the east, and this necessity suggested to the architect the adaptation of the design to a block of four flats as illustrated. Mr. Geoffrey Morland, A.R.I.B.A., of Kendal, is the architect.]

THE BUILDING TRADES EXHIBITION

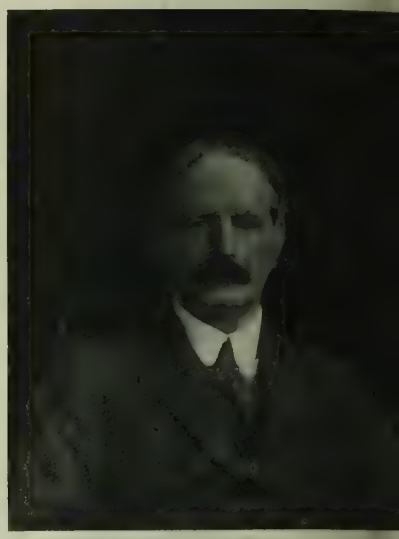
THE OPENING CEREMONY

HE MINISTER OF HEALTH ON HOUSING.

A representative gathering of members the architectural profession and the building des was present at the opening of the Exhi-ion, at 12 noon on Friday last week.

The chair was occupied by Mr. J. A. Gotch esident of the Royal Institute of British chitects).

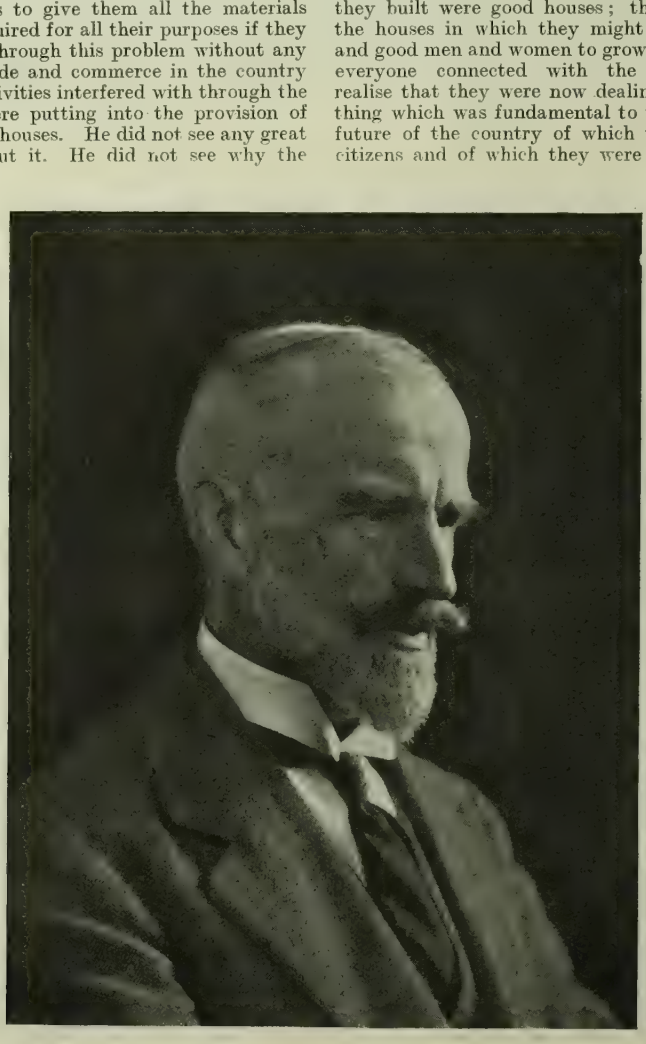
In introducing Mr. Wheatley, Mr. Gotch d it gave him the greatest pleasure, as Presi-nt of the Royal Institute of British Archi-ts, to accept the invitation to take the air on that occasion, because as architects thought they were all very much indebted Mr. Montgomery for the skill and enterprise had displayed in arranging exhibitions of t kind. He would urge all architects to e an opportunity of visiting the Exhibition; only architects who enjoyed large practices the pursuit of which they came in contact h many of the inventions and suggestions ich could be seen there, but more particu-ly would he urge those architects who lived the provinces, where they did good work a certain amount of obscurity and whose nes were not accompanied by a blast from trumpets of fame, to see the Exhibition. ey would go away from the Exhibition with ny suggestions and many interests, which ld very likely be of great assistance to them the pursuit of their calling. That day they l had an opportunity of seeing a report of important Committee of the building ustry on the question of housing, and it was , he imagined, outside the bounds of possi-ty that they might hear some observation that subject from a quarter which would ure their interest and importance. They st all be very glad to see from that report t the problem of housing was not insoluble. ther thing which was most gratifying to itects and to all who had the interests of building industry at heart, was that the le of the resources of the industry would not be concentrated on housing to the exclusion of ordinary building operations, which would still proceed. He was very much struck with the insistence the report gave to the operation of good will. He had recently been reading "The Life and Letters" of Mr. Page, the American Ambassador to this country during the war, and he was struck by the insistence which he made upon courtesy in international relations, and he could imagine that that good will and courtesy would help in the solution of most of the problems of life.



The Rt. Hon. John Wheatley, M.P. (Minister of Health) said he ventured to state that he felt proud and glad to have the opportunity of associating himself with the splendid exhibition in which they were interested and which they were about to open that morning. The Chairman, in his introductory remarks, referred to the Report for the Building Industry which had just been presented to him in his capacity as Minister of Health and he referred to the indications of good will that were to be found throughout the pages of that report. A friend of his asked him yesterday how he had succeeded in getting these building trades people to agree to so much and he replied, as the Chairman had so well put it that morning, that the only thing he contributed materially to it was confidence and good will and friendliness towards the people engaged, and an appeal to their honour to do their duty to the State. They had, he understood, with them that morning representatives of every branch of the building industry. They had first manufacturers whose business it was to produce the materials with which their building was done. They had representatives of the merchants whose business it was to facilitate supplies of these materials to the builders; and they had the builders and contractors and operatives whose duty it was to convert these materials into houses and other buildings. And they had also students whose desire in life was to better the building industry, and they had the architects so well represented by their chairman. And he would like to take the opportunity of explaining to all these people, and to those whom they represented, that his main interest in the building industry was in connection with the provision of good working-class houses. The nation needed these to-day in large numbers, and it needed them at low prices that would bring them within the need of the classes of people engaged in the production of them. They were given a good cause to-day to pessimistic prophecy about the future of the nation and he, not being a pessimist, feared that these prophecies would be realised if they continued on their present disastrous course. He wanted to draw their attention to the way they were drifting. Nearly three-quarters of the population of the country resided in small dwelling-houses. For one reason or another, mainly because of comparative poverty and industrial insecurity, most of these people could not afford to own the house they occupied and had to depend for housing accommodation on the supply of houses at weekly or monthly or yearly rents. There was at the moment a serious shortage of these houses. He would not go into the figures of the shortage or produce any evidence in support to-day. It was obvious to the man in the street, as well as to the man in the building industry. The unfortunate part of it was that things were not getting any better. In order to prevent the shortage growing they required an annual output of at least 100,000 of these houses. That number was required to meet the natural depreciation of property and the expansion in the population. And they were not getting that number, and in so far as they were not getting that number of houses their position was getting worse year by year. They were drifting as the result of that into conditions under which it was quite impossible to produce or maintain an efficient industrial population. and without an efficient industrial population it would be impossible in the future for Great Britain to remain great in the competition which it would have to meet amongst the industrial nations of the world. That made it a matter of the most urgent national importance that they should find a way, and find it speedily, out of their housing difficulties. It was not

The Opening Ceremony.

Left to Right: Major J. Petrie; the Rt. Hon. John Wheatley; Mr. J. A. Gotch; Mr. H. Greville Montgomery; Mr. H. Matthews.



only that they had a shortage of houses, but a shortage of the workers required to build houses. He noted that in 1901 they had 834,000 men employed in the building industry; in 1911 they had only 741,000; and in 1923 they had only 632,000. Now, if one were not aware of the fact that housing accommodation would in all probability be an eternal necessity one might be driven to assume that the building industry was in a stage of permanent decay. Not only that, but they found their skilled workers leaving the country because they could not find employment at reasonable remuneration in their native land. In addition to that, they had their labourers on the dole. That seemed to him to create a problem which the nation would benefit enormously by solving. The first substantial check to this backward slide would be to get the building industry properly organised, and so he had been appealing with some success to the building industry as a whole to lend the value of its experience and knowledge to the State in finding a way to produce these houses. After all, politicians did not produce houses. Houses were produced by the people who were represented there that morning, and it was mere common sense that they should appeal to the people who knew most about housing to help them to find the necessary houses. He wanted to appeal, first of all, to the manufacturers to increase the number of people employed in the industry and the capital invested in it, so that in getting the additional houses they hoped for they would have an output of materials which would enable them at the same time to continue ordinary building work, as they were advised to do by their Chairman that morning. A great deal would depend on the ability of the manufacturers to give them all the materials that they required for all their purposes if they were to win through this problem without any section of trade and commerce in the country having its activities interfered with through the push they were putting into the provision of working-class houses. He did not see any great difficulty about it. He did not see why the nation which wanted houses should not be able to organise its industry in such a way that instead of paying people for registering at Labour Exchanges they should pay them wages for producing and delivering the goods of which the nation was so much in need. He would appeal also to manufacturers, and not to them alone, to consider how the methods of production could be improved to the greatest extent so as to ensure that the increasing demand for building materials would not result in an increase in the prices of those materials. That was also very essential. There was first a limit to the rent which the class of people for whom they wanted houses could afford to pay, and there was a limit to the extent to which they could hope the taxpayers of this country would contribute in subsidy, and so it was clearly the duty of all of them to see that the problem was met so far as possible by not merely expressions of good will but by co-operation in industry, such as the improvement in their methods of production, and that for a given output of skill and capital they would be able to get an ever-increasing result. If they could get something like that as their object the difficulties which were now in the way would get less and less as the years went by. He would like to say a word to the students whom Mr. Montgomery had so very wisely brought into partnership in this Exhibition. He would like to appeal to them, and not only to them but to all the people engaged in the industry, to take a pride in their work and as far as they could do ensure that they were not going to have for the children who would be the citizens of this nation twenty or thirty years hence houses which were unworthy of their race. He wanted the operatives to see that the houses they built were good houses; that they were the houses in which they might expect great and good men and women to grow. He wanted everyone connected with the industry to realise that they were now dealing with something which was fundamental to the successful future of the country of which they were all citizens and of which they were all so proud.

Mr. J. A. Gotch, P.R.I.B.A.
(Chairman at the Opening Ceremony.)

He wanted again to express his pleasure
having the privilege of opening that Exhibiti
and trusted it would receive the attention a
success it deserved. He had great pleasure
declaring the Exhibition open.

Major James Petrie (President of the Ins
tution of Structural Engineers), in proposi
a vote of thanks to Mr. Wheatley, said
Building Exhibition had not been held for t
years now, and it was therefore dou
pleasurable to them to have it opened o
more by a Minister of Health. With reg
to Mr. Wheatley, it was rather difficult
him to say anything, because he was somew
of an unknown quantity. However,
Wheatley seemed to know what he was com
to the House of Commons for, even althou
other parties in the House did not appear
be very desirous of allowing him to have w
he wanted. The Labour Government had
pressed its intention and desire to do eve
thing it could to better housing conditions
this country. So had other Governments in
past; but Mr. Wheatley, as Minister of Hea
was very keen on pushing forward hous
as fast as he possibly could; and they ho
and were sure that some of the things he
seen or would see in the Exhibition would
of some assistance to him in his task.
believed the Government had stated its int
tion of building 200,000 houses per annum
an indefinite period of years. The intent
was no doubt excellent, but there was a
grave question as to whether the human fa
which entered into the problem permitted
such a number being built, at any rate
brick. The most difficult part of the hous
problem was the availability of man pov
and that that was the determining factor
the provision of workmen's houses. It
quite obvious that unless means were fo
whereby a greater number of skilled
might be established in the industry
probability of considerable expansion in
annual production of houses would not
realised. In the consideration of the ques
of building, Labour views tended to obsc
a comparatively simple issue. Sometime
complete answer to a request for augme
tion was thought to be found in the t
number of unemployed, but upon analysi
was found that practically the whole of
unemployed consisted of unskilled men.
the addition in some cases of painters, du
the seasonal fluctuations in painting op
tions. Normal unemployment in the ski
trades might be assumed to be about 5
cent., but for some time past unemploym
in such trades as those of the brickla
plasterer, slater and carpenter had been
siderably sub-normal. Another fallacy
often appeared was that of assuming that

Mr H. Greville Montgomery, Hon.A.R.I.B.A.
(The Organiser of the Exhibition).

of the skilled trades might readily be available for the building of workmen's s. There was, first, the question of the er of workmen necessarily and urgently ed for maintenance and repairs. This made a far greater demand upon the ng industry than was usually supposed. gures given were that in this work one- of the total amount of labour available building trade was employed. Of the ximate two-thirds remaining, it might be assumed that one-third would be ed for industrial and commercial build- Thus one was left with about 40 per f the whole available for house building, his number would represent approxi- 125,000 houses per annum. There was, rse, the all-important question of the ility of the building of houses and cot- with unskilled labour. That, of course, that those houses and cottages would to be built in some material other than and he commended to the serious atten- f Mr. Wheatley the possibilities offered ncrete. This material was, he thought, y acknowledged to be superior to all with the exception of brick, and ly as many people would say that con- was superior to brick as brick would find rters on the other hand. In any case were very many systems now of concrete- building, and some of these, he was were very excellent. The fact that such tant centres as Liverpool, Glasgow, urgh, etc., had adopted concrete cottages fficient answer to any opposition which be incurred. Some years ago there many valid objections to building houses ttages of concrete; it could not be denied, er, that at the time concrete was in its y as a material for house and cottage ng, and the numerous strides which had ly been made would confound those who t taken the trouble to keep in touch with had been done during the past few years. uld assure Mr. Wheatley, without any ice or bias, that concrete houses could de every bit as good and every bit as ive as brick houses. It was impossible he whole of the housing programme be carried out in brick houses: whilst te was a material upon which unskilled could be used, which could be made ttractive, and in which houses could be apidly and efficiently built.

vote of thanks to Mr. Wheatley was ed by Mr. H. G. C. Johnston (President of stitute of Clayworkers), who said he ed he ought to say something to contro- he statements of Major Petrie, but time t permit of that, so he would content with adding his quota of thanks to Mr. ley for his kindness in being present that g, and for the excellent and helpful he had made. Few of them expected ith the advent of a Labour Government ould have such silver-tongued orators Wheatley. As Chairman of the Com- of Building Manufacturers and Suppliers ld like to express their thanks to Mr. ley for the way in which he had met them express their belief in the honesty of of the Government and Minister of in tackling the housing problem.

plying, Mr. Wheatley said, with regard to tement made that the bulk of the unem- were unskilled workers so far as the g industry was concerned, and that re they might not look for much assist- om them in the solution of the housing n, he submitted that that was rather a ial view to take of the situation. The s that those men were unskilled because d not been trained, and they had not to r the cause of the troubles of to-day in penings of this morning. They should l to prevent the troubles of the future by ng the conditions of to-day. He was l that into the essential industry of house her forms of building they should bring er supply of highly-skilled labour, and s the basis of the report from the building y to which reference had been made. The building industry had laid itself out to produce scientifically the essential building labour for the nation, and if it did that, and a greater number of youths were trained in the industry, they would not be able to say in the future that labour was needed but could not be got. If they could not get labour to-day it was because they had neglected their duty in training the necessary labour in the past.

A vote of thanks to the Chairman was proposed by Mr. H. Matthews (President of the National Federation of Building Trades Employers), who said they were delighted that Mr. Gotch had been able to be present. They had heard a great deal about which one might say very much, and if they could have a discussion on some of the matters put before them by previous speakers they would find very wide differences of opinion. But there was no time for that, and he would simply ask them to indicate their very great pleasure in having Mr. Gotch as their chairman.

In a brief acknowledgment Mr. Gotch asked them not to think he undervalued their kindness if he said it was wholly unnecessary. It had been a very great pleasure to him to be present and to hear such an interesting speech by the Minister of Health.

A GENERAL IMPRESSION.

Anyone interested in building (and who is not?) must find a wide appeal in the Exhibition. The resource and enterprise of exhibitors is seen once more in the progressive character of exhibits and the methods of their presentation. It would be too much to say that they all take the best advantage of the opportunities offered, for there is an increasing realisation that it is not only in the intrinsic value of the goods shown, but also in the way they are presented that they must base their best appeal for notice. When bricks and tiles, stones and slates are shown in some actual building, their quality is not only made more attractive but is far better realised. There is always plenty of matter in the wrong place in the industries connected with building, and the more elaborate and fussy the setting the more are the real objects of the exhibition obscured. There are again a few pavilions and stalls which are a pleasure to look upon and which lead up to some studied appreciation of materials and treatment. We miss some of the former successes of stone and slate exhibits, but one of the latter vies with the best of the brick pavilions in its appeal. The added space on the ground floor is a great advantage, and all this extra space appears to have been readily filled.

Exhibits, amongst which one of the two *Builder* stalls occupies its usual place, seem more numerous than ever. Many excellent examples of craftsmanship and decorative work are exhibited, but we could have welcomed more of the first-named. Though there are some fine exhibits of stoves, ranges and fireplaces, this department appears to us rather less in evidence this year; but it cannot be said that there are too many side-shows which have little or nothing to do with building proper. It is apparently impossible to get all the best exhibits into the best positions, for some that deserve better are tucked into a certain measure of obscurity. Notwithstanding the strain on time and cost imposed on those who wish to be in evidence at the many recurring exhibitions, and the added attractions at

The Rt. Hon. John Wheatley (*Minister of Health*).

General View at the Opening Ceremony.

Wembley this year, the advantages of the Building Exhibition continue to bring to it so many exhibitors of note that no architects or builders can afford to rule it out of their sympathies.

The various exhibits must make their varied appeal to individual visitors, and we may here suggest that this can only result by the readiness of the visitor to give some sort of consideration to the objects shown. We remember years ago at one of these exhibitions meeting a well-known and distinguished architect who was paying a hurried visit, and was just leaving when we met him. "There isn't much of interest to me," he said. But after a half-hour's talk and note of various exhibits he changed his opinion and felt rewarded for his visit. In such a large assemblage of things as has been got together at the behest of Mr. Greville Montgomery the eye is naturally at first attracted by a good display of form and colour, and there are few, if any, kind of exhibits which do not lend themselves to some distinction of this sort. It might seem invidious to mention any particular names, but the eye will at once be caught by some of the brick exhibits and their excellent pavilions and interior decorations. Messrs. Collier, Messrs. W. T. Lamb & Sons and T. B. Lawrence & Sons. and others, have had architectural advice in producing very attractive exhibits, and the old Delabole slates and Burlington slates are well displayed in small pavilions. A fine statue by Mr. F. Doyle-Jones, constructed in white cast concrete stone, with an aggregate of Cornish granite, and cast by Mr. E. F. Munday, is shown by the Adamite Co., Ltd., who are to be congratulated on getting the services of Mr. Doyle-Jones, the sculptor, to give dignity and value to their exhibit.

After all, a great value in such an Exhibition as this is the illustration of the application of materials in some form of actual construction, and if this could be made a more definite feature exhibitors and visitors would all be gainers.

The new annexe to Olympia is a fine well-lighted hall, and along the walls of this are arranged many interesting architectural drawings, which include a large collection of H. W. Brewer's drawings, which have been illustrated in *The Builder*, as well as the originals of *The Builder* series of Cathedrals.

An unusually good stall is that of the Bath Artcraft Co.; the Drytone is amongst the best; and much of the excellence of the Carron Co., the Eagle Range, Smith & Wellstood, Thos. Parsons & Sons, Manders' varnishes, and Crittalls, uphold the high standard of the best these Exhibitions have shown. *The Builder* exhibit of models is a striking feature of the stall.

If one compares this show with the other three held since the war, perhaps the most noticeable feature one misses is the plethora of new systems of cottage construction, which occupied so much space and claimed so much attention a year or two ago. Evolved in a hurry to serve a national emergency, it is not to be wondered at that they have not all survived. At one time the number of different systems of cottage construction approved by the Ministry of Health must have been considerably more than a hundred, whilst now the number of special methods which are being used to any extent can be counted on the fingers of both hands. But it has been a case of the survival of the fittest, and it can be said that the patented and special systems to be seen at the Exhibition have most of them passed the test of time and are now accepted as alternative methods of building by which sound cottages may be erected. It is interesting to note that most of these systems, which are chiefly of concrete, recognise the inherent qualities of traditional building with small units, for although the concrete block is larger than the standard size brick still it is being used to a much greater extent than the systems in which whole cottages or whole walls are cast in one monolithic whole.

While considering concrete cottages, the considerable number of stands devoted or partly devoted to the artistic possibilities of this material may be mentioned. Coloured cements and materials for colouring cement and concrete, ranging from powders to mix with the dry cement to paints for application on concrete after it has set, are to be seen on several stands. Other methods of treatment, chief among which is the use of coloured aggregates exposed by scrubbing the cement from the surface before it has finally set, are shown by means of small panels on several stands.

It will come as a surprise to many to learn that such well-known sculptors as Mr. Gilbert Bayes, Mr. Doyle-Jones, and Mrs. Phœbe Stabler have executed sculpture in concrete, yet such is the case, and a specimen of Mr. Doyle-Jones's work, executed in white cement, is on view on one of the stands.

Several of the stands bear testimony to development in constructional methods to the increasing adoption of machinery. gang of navvies with barrows wheeling mate excavated from foundations over plank tra is now rarely seen in urban areas, where ste shovels which scoop the material from site and dump it direct into lorries have pro speedier, cheaper, and less obstructive traffic.

The power hoist is also in evidence. familiar "Scotchman" presiding high in air over building operations is a familiar si and is likely to remain so for many years come, but we call to mind one or two l buildings operations in London which have built without his aid during the past few ye These hoists, by which material may be elev to the top of a building at high speed wit the necessity for scaffolding, are now b extensively used, where the work in h warrants their adoption, by those who re the increased speed with which they will materials and the large amount of ma labour they save.

One welcomes the selection of machinery mixing concrete which is on view. When nature of concrete is considered it is obv that the best results will not be obtained u the cement and fine and coarse aggregate so thoroughly mixed that every particl stone is coated with a film of cement, and rather remarkable that it is only within paratively recent years that machinery been developed for this purpose. In r quarters the gradual displacement of ma labour and craftsmanship by mecha devices is deplored both on account of the of individuality in the finished product because it tends to replace the craftsman machine-minders, but it is doubtful if an can bring this argument to bear in the ca the mixing of concrete. The best desig concrete construction can be rendered u if the materials are not properly mixed, s one compares the results turned out by a the reliable machines on show at the Exhi with a concrete turned over by hand board—the degree of mixing of which, h nature being what it is, depends to a extent on the tirelessness or otherwise c back and arms of the labourer doing the —the well-designed machines with a rapid put now on the market are a very we feature.

THE STANDS.

piece of sculpture by Mr. F. W. Doyle s (illustrated in this issue) is shown by damite Co., Ltd., of Regent House, Regent-t, W.1. This sculptured figure, entitled e Spirit of the Rocks," has been executed ncrete composed of " Atlas White " cement an aggregate of Cornish granite. The use e white cement prevents any tendency to ct from the effect of the granite such as l have been the case if a grey cement had used, and the texture of the figure is ly that of the aggregate in which it is lled. The possibilities of white cement decorative purposes are well shown by exhibits of sample slabs in which it has used; these specimens of cast stone have xcellent appearance which should appeal chitects in search of something which has ically all the attributes of natural stone r as strength and appearance are con-d, yet is considerably cheaper. " Cole-id," a liquid which is added to the gauging to harden and waterproof concrete, is exhibited.

n Liversidge, Ltd.—With a demonstration aint-burning, lead-burning, and welding ratus proceeding during the greater part of ay, this stand is proving a big attraction. interesting to builders will doubtless be rm's new paint-removing apparatus, which ts of a steel bottle of dissolved acetylene ting in connection with a paint-burning ipe. The flame is simply a mixture of the lene with air admitted to the blow-pipe no oxygen bottle is therefore needed. made with this apparatus and with normal l and paraffin blow-lamps are extremely rable to the air-acetylene. It is a time- and the flame does not blow out in the st of winds. For girder cutting a special cetylene apparatus is shown, being supplied with the gas in steel bottles ready for use, th a gas-generating plant. A complete of builders' and contractors' acetylene large and small, including hand-lamps, is ted.

D. Anderson & Son, Ltd.—Those interested in all forms of " Red Hand " roofings, sarking and lining felts and dampcourses, including " Rok," " Stoniflex," and " Hippo " roofings should not fail to pay a visit to this stand. The special exhibits consist of a section showing the construction of a " Belfast " roof, and a section demonstrating Anderson's flat roofing system. Both these form the actual roof of the stand, and access to them is gained by a stair-way. " Rok " roofing and " Ferro-Rok " are used as roof coverings on the Belfast roof. Wood fencing treated with " Sidol " wood preservative is shown; the stairway to the " Belfast " roof and the flat roof is likewise treated, as also is all other woodwork of the stand.

Art Metal Equipment Co., Ltd.—The most interesting perhaps of this firm's exhibits are their rolling steel doors or shutters as used for large openings, and which comply with the L.C.C. and fire offices' regulations—an exacting test. Working parts are fitted with ball bearings to ensure ease of operation. Economy of space by the use of steel is shown in the fitting-up of record rooms, libraries, strong rooms, filing departments and archives, &c., where every square foot of space is of great value.

Concrete mixers and block-making machines, a rock crusher, and a hoist are to be seen on the stand of the **Australia Concrete Machinery & Engineering Co., Ltd.** The " Tonkin " mixer and its power unit are now mounted so that the whole of the working parts except the axle and stirrers are totally enclosed, so that there is no possibility of dust or the materials being mixed interfering with the running. The mixing trough has also been fitted with an improved method of discharging the mixed materials. The well-known " Australia " block and slab-making machine, which has been used on a large number of housing schemes and turns out 400 slabs per day by hand operation, is on view, and also a strongly-constructed hoist.

Baldwins, Ltd.—Chief among the exhibits on this stand is a one-bolt manhole hot-water tank and welded galvanised hot-water cylinders. There is also a display of galvanised cisterns and tanks, black sheets, and a variety of paint kegs, drums, and taper neck cans. The stand, which is unlike any others in the exhibition, is calculated to appeal to the builders' merchant rather than to the builder himself, as Messrs. Baldwins do not deal direct with the retail purchaser.

Bell's Poilite & Everite Co., Ltd.—From whichever side one enters the New Hall, the eye is at once caught by the 60 ft. high tower which crowns this stand. The lower portion of the erection is octagonal with a roof showing the possibilities of Poilite pantiles, particularly the russet-brown shade, of which the firm has made a speciality. The tower proper is 11 ft. square, and is clothed in " super " Everite " Big Six " corrugated asbestos cement sheeting, for which it is claimed that its first cost is its only cost, as it does not require painting or other treatment, and is water, fire and acid proof. Above the 11 ft. section of tower yet another portion rises, this time 7 ft. square, clad in " Standard " Everite corrugated sheeting, the roofing between the two tower portions showing Poilite slating in various colours. The top of the tower is a hipped roof with standard red diagonal tiling. Outlining the octagonal portion of the stand is " Everite " rainwater piping, which is claimed to be stronger and lighter than castiron.

George Blay.—The man who desires a cheap garage, the steel shelter hut exhibited on this stand should have a distinct appeal. Built of 14-gauge rolled steel sheets and secured with bolts and washers, these buildings are self-supporting and require no structural work or bracing of any kind; they are quite easily erected or dismantled, are waterproof, and practically indestructible. The hut at the stand shows a heavy wood door at one end. Rising in an arch above the hut mentioned is a section of a steel building, 12 ft. 6 in. in greatest height, and 14 ft. in width. On the stand is a good display of excavator's tools; also standard cottage pattern steel casements, such as are now in large demand for housing schemes.

" The Builder " Stand.

The Minister of Health Inspecting a Model on "The Builder" Stand.

Pumps and hose, builders' and road flares, fencing, expanded metal sheets, and other items, make up a comprehensive display.

William Briggs & Sons, Ltd., give a special display of "Utex," the utility roofing. It is a light-weight roof covering of great durability and especially suitable for underslating purposes. Bitumen "damp courses" for foundation walls, including "Aqualite," "Plastique" and "Challenge" brands, are also shown. Specimens and models demonstrate the "Challenge" composite roofing system, which consists of laying two or three layers of "Challenge" roofing to either flat or slightly pitched roofs of wood or concrete.

In a large stand in a central position the **British Fibrocement Works, Ltd.,** illustrates the adaptability of its various "Fibrent" asbestos-cement manufactures. The roof is sloped at different angles to show diagonal and straight patterns of slating in four shades, and there is also demonstrated the "Fibrent" corrugated sheeting with which the Company was early in the field. The appearance, strength and simplicity of the "Fibrotiles" should also be noted by the visitor. The hut walls show the use of Fibrent corrugated and flat sheets; there is a gable which gives a good idea of the half-timbered effect which can be obtained, and the end wall demonstrates the Fibrent panel sheet and the method of fixing with a rebated joint.

The British Vacuum Co.—Examples of this efficient, economical and easily operated vacuum cleaner can be seen on this stand. Designed and constructed by the originators of vacuum cleaning, the B.V.C. cleaner is made of solid oak with highly plated nickel fittings. So compact is the design that very little room is required for storage when not in use.

O. Bruster.—The "Baseco" is an independent boiler possessing some unique features. A special water pocket in the dome secures maximum efficiency with a minimum of fuel. The dome is easily removed, exposing the whole of the interior, with easy access for cleaning. This is particularly advantageous in districts where the water supply is exceptionally hard. Where the water contains acids in solution, or where peaty water is encountered, the cast-iron construction is a valuable feature as it does not readily corrode. The "Glow-Worm," another exhibit, is a small inexpensive boiler designed for domestic use. Waterways are so constructed as to form a baffle to increase heat transmission to the water, while the hot gases are directed by the baffle to traverse the underside of the hob, making it a really effective hot plate. Broken coke, anthracite or household refuse, may be burnt. A smoke pipe with door serving as regulator, ventilator, and facilitating cleaning, is supplied.

Builders' & Contractors' Plant, Ltd.—Restrictions in the matter of vertical space prevented the exhibit by this firm of a combined travelling crane, hoist and concrete placing plant, but there is plenty of interest to be noted on the stand, nevertheless. There is, of course, the well known "Exe" hoist, though even here a 20 ft. cut has been made to enable it to be shown; in connection with it there is the arrangement for hoisting either the concrete tipping skip or barrow platform. Some small derricks, for the smaller firms which cannot afford steam plant, are to be seen; the apparatus is supplied with either twin or single jib, and the capacity is about five cwts. Sand washing apparatus will attract interest, as also the various screening plants, oil engines and so forth. The utility and simplicity of the firm's special form of timber clip, for use with square timbers will be appreciated. Other things which should be noted are the concrete block-making machine, a special patent turntable for trucks, and trench pumps and trench braces.

Lancashire quarry district. Slates of m sizes, qualities, and colours are used in the w and roof, whilst the floor shows the value of s for paving to meet different requirements.

Messrs. Byrd & Co. are demonstrating "Metaform" method of wall construct which is now being widely used by man the leading contractors in this country. size or shape of concrete walling can be car out with these forms, which are standard in units to build round any curves or an The use of this type of metal shutterin extremely simple, and as the plates can be us large number of times before they become w out, a considerable saving can be effected their use as compared with timber, which w cut for one job can rarely be used for anot

George M. Callender & Co., Ltd.—Der strating the waterproofing properties "Callendrite" sheeting is a model rese constructed of wood with sloping sides, l throughout with this material. The rese

HOIST SHOWN BY BUILDERS' CONTRACTORS' PLANT, LTD.

The Burlington Slate Quarries.—As a demonstration of the possibilities of slate in building work this stand is a complete success. Carried out in the form of a small pavilion, the main piers which carry the roof are in varying thicknesses of slate stone, with weathered bed-joints according to the local custom in the North

is being maintained full of water during period of the Exhibition. In the centre reservoir is a column of loose bricks, und top course of which, just above water-le inserted a piece of "Callendrite" dampc Though highly porous, the bricks abov dampcourse remain absolutely dry, thou

nditions are far more severe than anything kely to be met with in actual practice. Ledkore " dampcourse, lead core with bitumen verings, " Protex " for damp-proofing walls, Bitusol " anti-rust paint for iron and steel-rk, roofings, felts, roof repairing compound, ., are also exhibited.

Walter Carson & Sons.—" Matamure " is a ently introduced flat oil paint for all interior orative work where a dull, non-glossy surface equired. It possesses an excellent matt finish, lurable and easily cleaned. There are some nty-six different shades from which to select. 'overine " is a white undercoating of estab-ed reputation. Its use saves time in pre-ration work. It only requires to be thinned h turpentine and is ready for application five minutes or less. Further, it dries hard, l, since it can be coated in a few hours, the shing coat can be applied and the work mpleted in the same day. Metallic paints a speciality of the firm and the range offered ludes aluminium paint for hot water and am pipes, radiators, gates and ironwork erally, and coloured paints for radiators and rior metal work. Specimens of work with above paints with other of the firm's numer-products are attractively displayed.

Carter & Co. (London), Ltd.—Terrazzo work, in rs, dados and staircase toppings and steps is ays interesting for its inherent beauty of ign and finish. Messrs. Carter's have a com-hensive exhibit of terrazzo of all sorts in the w Hall—steps of Hopton wood terrazzo ntical with those being installed in Adelaide use; slabs of white marble terrazzo with orative borders in vitreous glass; terrazzo id with black monastic tile; terrazzo columns oft shades of cream; floor combinations of azzo and mosaic, and Venetian glass mosaic ures are shown.

arron Company.—A selection from Messrs. ron's designs of ornamental cast-iron columns, ngs and panels are used in the formation of

Grate Shown by Carron Company.

stand. The firegrate exhibited is constructed ntirely new lines, without complicated or blesome regulating devices. All the heat ilised, and is simply regulated by adjust-of the canopy; it gives an ample supply ot water, and the temperature of oven is ily raised and easily maintained. An tial point is that it is most economical in and efficient in every respect. It has arronia " barless fire, with ventilating fret, nental canopy and " footman," together a large hot-air oven for baking, and a odious hob over oven, with door to form hot closet. The new design black boiler interior grate is also shown.

Cayless Bros. (Battersea).—Important improvements have recently been made in connection with this firm's patent telescopic ladders. Spring cases, or clips, are now provided for the pulleys to permit easy withdrawal or replacement of the elevating ropes. The time usually expended on threading the ropes over the pulleys is saved, while the fact that the ropes can be easily removed is an advantage where they have to be stored in the open. No cast-iron or malleable iron is used in the construction of the ladders. Wrought-iron fittings are used throughout. In place of grooves cut into the stiles or uprights wrought-iron running studs and guide plates are fitted, facilitating manipulation of the ladder and prolonging its life. Hand-carts, barrows and builders' requisites generally are also exhibited.

The Gelesco Paint Co.—No better testimony to the firm's products could be had than the excellent decorative work that has been recently carried out at Messrs. Debenham & Freebody's. It is open to inspection, we understand, by appointment, and is well worth a visit by anyone interested. " Gelesco " ceiling distempers and " Semesco " washable distempers are among the principal exhibits.

The Cement Marketing Co., Ltd. (selling organisation of Associated Portland Cement Manufacturers, British Portland Cement Manufacturers, Ltd., Martin, Earle & Co., Ltd. and the Wouldham Cement Co., Ltd.) have an office at which are shown samples of the well-known brands of cement, for which they are the selling organisation, and of the raw materials used in production.

Charles Churchill & Co., Ltd.—Non-slip staircases and treads form one of the features of this stand. The " Alundum " tiles, as they are called, are so hard that they will not become polished by ordinary hard wear, in addition to which they are acid proof. Their utility may be judged by the fact that the Company has most of the railway companies among its customers. Examples of stairs made of these products, and of stairs with tile treads inset, are shown. Also are to be seen terrazzo tiles and aggregates for treating cement floors to render them slip-proof. For rubbing down terrazzo there are samples of rubbing bricks. Interest also attaches to the " Manning " abrasive cloths and papers, including " Speedgrits " for the wet rubbing down of enamels and varnishes, waterproof flint paper for the wet rubbing down of paint, garnet paper for sanding woodwork, and metal polishing cloths and papers.

The Climbing Steel Shuttering Co. exhibit their patent system of revolving galvanised steel shuttering for building concrete walls *in situ*. This shuttering is formed of light galvanised steel plates, one for each face of the wall, which are placed in position the desired distance apart, wired together, and filled in with concrete. To form the next and succeeding courses the wires connecting the lower edges of the plates are cut and the latter turned up from the bottom, the top wires acting as hinges.

Colthurst, Symons & Co., Ltd.—A visit to this stand shows their patent interlocking Roman tiles. This pattern so interlocks that they are not easily displaced, and nailing is rendered unnecessary. Also patent " Paragon " tiles of improved type can be seen. There are raised checks in the formation of this tile which give protection against side or up drifts. The registered " Acme " tile is also on view.

The possibilities of artificial stone for decorative purposes are well shown on the stand of the **Croft Granite, Brick and Concrete Company, Ltd.**, who are exhibiting window frames, fireplaces, door hoods, brackets, architectural stonework, and garden ornaments, such as flower vases, sundials, and bird baths. These products are practically indistinguishable from natural stone, and have a particularly clean-cut finish. On this stand are also shown concrete sewer tubes, paving flags, kerbs and channels, fence and lamp posts, garden rollers and reinforced concrete floors. In natural stone there are granite kerbs and setts, channels and other stones, and tarred macadam and common and special bricks are also shown.

A simple type of revolving drum mixer, known as the " Willing Worker," is exhibited by **Messrs. Drummond Brothers, Ltd.** This machine is mounted on a trolley and driven by a 3 h.p. paraffin engine. The capacity is from 6 to 8 cu. yds. per hour. It is arranged for hand tipping, and the engine is totally enclosed. A diaphragm pump mounted with a paraffin engine on a portable trolley, with a capacity of 5,000 gallons per hour and a lift of 20 ft., a drag saw complete with a 3 h.p. engine, and a duplex force pump are also shown.

Eastwood's, Ltd., & G. H. Smith.—Damp-proofing materials, which have been given the name of " Sika," are displayed in profusion at this stand. Attention is attracted by the demonstrations which are being given twice a day of the " Sika " method of rendering a concrete wall while water is running over it. In this connection it is of interest that " Sika " has been used throughout the Simplon and St. Gothard tunnels, wherein big streams of water were met; a photograph on the stand shows this work being carried out. Important tests made for absorption showed that at fifteen atmospheres no water percolated through concrete treated with " Sika." Other materials shown are cement, tiles, bricks, &c., treated to waterproof and to prevent deterioration from other causes. There is also " Purigo," a material simultaneously to clean and harden stone, ten different colours in fire-proof paint, and a special putty for laying parquet direct on concrete.

The " Eclipse " Rail-Track Ladder Co.—Shown here for the first time is the " Eclipse " patent scaffolding, which can be erected in very short time and by unskilled labour. This scaffolding seems particularly suited to the smaller type of building work, and it has the advantage of causing no obstruction. Another item of interest on this stand is the company's extension trestles, which are similar to the ordinary trestle, but have a ladder extension to rise from the apex to give an added height of several feet if required. Another of the newer lines is the useful folding trestle for the use of paperhangers. In addition to the items mentioned, there is a large display of extension ladders, hand-trucks, builders' steps, and other things of a similar nature.

The Elsan Manufacturing Co.—The " Elsan " indoor closet is all steel, stove enamelled and

scientifically ventilated. A specially prepared chemical is used, a pint of which mixed with one or two gallons of water, is put in the container each time it is emptied. The chemical deodorises and liquifies the sewage, rendering it harmless and odourless.

Evans & Ronald, Ltd.—Utility is a common characteristic of this firm's exhibits. The "Eddoll" gate latch is a new device for keeping gates closed. It comprises a strong spring clip, in a malleable iron body, into which the latch piece fits. You simply close the gate, the clip keeps it shut. It is simple, easily fitted and there is nothing to get out of order. Equally ingenious is the "Evron" combined barrel bolt and bullet catch for doors, windows, &c. The "Riddick" door handle, another exhibit, is noteworthy as being free from grub screws. Knobs are composed of two hemispheres that screw together, the bottom halves being fixed to the spindle by substantial nuts. Adjustment can be made to one-hundredth of an inch. "The Clip-On" all teak draining board is also shown.

Ewart & Son, Ltd.—The firm's "Victor," "Lightning" and "Califont" geysers are demonstrated in use. Nickel-plated bathroom fittings and toilet requisites, pedestal lavatory basins and cast-iron baths of improved design, porcelain enamelled Roman baths, "Emperor" cowl for smoky chimneys, and "Boilo" copper for gas or oil heating comprise the remaining exhibits. The "Califont" provides instant hot-water service to any number of draw-off points required and need not necessarily be fixed in the bathroom. Gas and water supplies are interconnected in such a way that the gas is instantly lowered to a pilot light the moment the flow of water is turned off. Turning on the tap at any draw-off point immediately brings the geyser into operation again. Temperature of the water depends on the rate of flow and hot-water is delivered under full pressure of the cold water supply.

The exhibit of the **Expanded Metal Co., Ltd.** comprises samples of the firm's reinforcement, including: "Expamet" expanded steel for foundations, walls, roads; "Expamet" lathings for plaster work; "Exmet" reinforcement for brick and concrete-block work; mild steel cavity wall ties; and sections of walling, &c., showing the uses of these products.

George Farmiloe & Sons, Ltd.—This stand is glazed with "Baltic" and "Oceanic" glass in white and various tints, and shows how this can be used with a very pleasing effect. Decorative work has been carried out with "Father Thames" white lead paint, "Stargloss" enamel paint, "Eskimo" leadless paint, and "Zingessol" a high-class washable water paint of long-established reputation. Sheet lead, lead pipe, compo pipe, solders, "Tea" lead and other lead goods are exhibited on a representative specimen board. Examples are also displayed of tile, slate, zinc, and lead roofs, indicating how "Hermetex" can be applied for repairing any kind of roof cheaply and quickly. "Hermetex" is a high-grade asbestos compound, waterproof, and remains unaffected by change of atmosphere. Sanitary specialities are also included in the display.

Falkirk Iron Co., Ltd.—Two stands house different classes of the firm's productions. On Stand No. 201, Row K, are displayed high-class period fireplaces, dog grates, casings, kerbs, &c. The rustless steel models are very attractive, as are also the "Alfred Stevens" designs. On the second stand (No. 228, Row L) the latest improved "smooth top" combination gas range is of outstanding interest. Thoroughly well constructed throughout, it is provided with many labour-saving and waste-preventing devices. For the solid smooth, with boiling rings and solid covers inset, it is claimed that the heat usually wasted is saved The smooth surface is easy to clean and there are no corners to hold dust and dirt. A by-pass burner with automatic lighter is provided.

Fawcett Construction Co., Ltd.—Fawcett's "Mon'Lithcrete" (rolled steel) girders for floors roofs and bridges are exhibited at this stand together with "The Edwardian" down draught preventing chimney pot, and Fawcett's tubular flooring. "Mon'lithcrete" is specially suitable for cottage bedroom flooring. A list of contracts, which can be seen at this stand, speaks for itself.

A new water heater for lavatory basins, sinks, &c.—the "Bantam"— is among the exhibits on view by **Fenlon & Son.** It is made of stout, hardened copper, interior tinned, exterior polished and lacquered, and fitted with brackets for screwing to wall. Capacity about 1 gallon a minute. Most of the firm's standard geysers—the "Tudor," "Fleet," "Wonder," "Shrewsbury," "Calda," &c.—are represented, a particularly attractive combination being the "C.C. Fleet" circulator and storage tank combination.

Fernden Fencing Co., Ltd.—This firm is showing a comprehensive selection of its well-known specialities covering fencing and paling work of every variety. The well-known Fernden cleft chestnut pale fencing is prominently displayed. It is durable, inexpensive, and suitable for many fencing purposes. Gates of various designs, notable for high-class workmanship and finish, are also included.

Ferodo, Ltd.—The successful use of Ferodo treads on the landing stages of the Liverpool docks furnishes excellent proof, if proof be needed, of their hard-wearing properties and suitability for outdoor use. In addition to samples of Ferodo stair treads, Feroleum nosings, friction linings and floorings, other specialities are shown, including a patent attachment for worn stone steps; a serrated edge for tramway running boards, and Ferodo stair tread dressing, which, applied at long intervals to the treads, refresh their colour and prolong their life.

Concrete mixers and stone crushers are shown by **Messrs. John Fowler & Co. (Leeds), Ltd.,** The mixer has a drum constructed of semi-cast steel for the centre section and pressed steel for the sides, which reduces the weight to a minimum without sacrificing the life of the machine. It is fitted with a paraffin engine and a power loader, mounted on a road truck. In the stone and rock crusher a drawing motion is introduced which gives a double crushing effect tending to force the material down into the mouth. This machine can be easily adjusted to crush to any size from 4 ins. downwards.

R. W. Greeff & Co., Ltd.—Many interesting experiments are carried at this stand with "Kronos" Titanium White, a new paint material, manufactured by the Titan Co., A/S Fredriksstad, Norway. The exhibits illustrate the preparation, properties and uses of this new pigment. Specimens are shown illustrating its manufacture from the metal Titanium. This name, it should be noted, is not proprietory but the actual name of a metal. The durability of paints prepared with this pigment is demonstrated by the exposure tests exhibited, in which panels painted with Titanium White and other pigments have been exposed for a period of three years under drastic conditions to the weather, and yet retain an excellent surface condition under identical conditions. The opacity of Titanium White is demonstrated by specimens in which it is painted out side by side with other pigments over coloured backgrounds. But the outstanding feature is that Titanium White is free from lead and is absolutely non-poisonous and harmless in use. Demonstrations of "Wetordry" waterproof sandpaper, which is both hygienic and economical, are given at the stand.

The Gripwell Staging Co.—A visit to this firm shows that the patent steel staging brackets, for fixing to ladders, poles or tubular supports, are, as their name implies, absolutely danger-proof, and form a solution to the difficulty of securely fastening staging.

Hoyle, Robson, Barnett & Co., Ltd., and **John Smith & Son.**—In the decoration of this stand an effort has been made, and with success, to show the application of the firms' various paint specialities. Thus externally the window frames and sashes demonstrate the value of "Protecteros" high gloss paint for outside use, while in the interior part is made handsome with "Saneros" water paint and part with "Hoyflat" oil paint, the latter being a recently introduced finish. For visitors anxious to try the paints for themselves there are tins, brushes and small wood panels. As to varnishes, which are more particularly the province of John Smith & Son, there are "Tynelac" which carries a guarantee with it, and "Palusta," which, as its name suggests, is a kind of "super" pale varnish. The "Cheyne" paint mixer and grinder is shown in operation at this stand.

Robt. Ingham Clark & Co., Ltd.—The stand representing the Associate Houses of Messrs. Robt. Ingham Clark & Co., Ltd., and R. Ga & Co., Ltd., is composed of five columns arranged around a forecourt having two private offices at the back. The columns are decorated with Pearline white enamel. The front of the offices which forms a background for the white columns has been decorated with Gaymatt flat oil finish and is of a deep-blue colour.

The Interoven Stove Co., Ltd.—The latest improved "Super-Interoven" well merits its prefix. It has a far larger capacity than the standard model, being built to meet the cooking requirements of 14 or more persons while furnishing an ample supply of hot water for domestic purposes. Conversion to an open-fire sitting-room grate is the work of a moment. The spacious oven vertically above the fire accommodates an 18 lb. joint with one or two pies or puddings. Hot closets are provided

EXHIBIT BY THE INTEROVEN STOVE CO., LTD.

on either side of the oven for light cooking, warming plates and dishes or keeping cooked foods hot. Extra large hot-plate accommodates six saucepans. The wrought-iron boiler circulates hot water to a 50-gallon tank or cylinder. Three or four radiators, according to size, may be used. "Bewty" expanding barless fire fronts for modernising old-fashioned sitting and bedroom grates at small cost, dog grates, wrought welded range boilers of every description, and "Interovens" are also exhibited.

The Ironite Co., Ltd., manufacturers "Ironite" cements for flooring and waterproofing, which are claimed to be wear-proof, dust-proof and grease-proof are represented. The firm also exhibits a model automatic crane and hoist, which can be operated by one man.

G. Johnson, Bros.—Examples of artistic metal work for signs, shop fronts and architectural purposes are displayed in large variety. Particularly interesting items are metal mouldings drawn on hardwood cores, used in the manufacture of frames, sashes and doors, the wood being sheathed with bronze. Mouldings are made and plain and ornamental castings supplied to cover joints and angles, so that the builder can work these together as easily as he does his wood front. Illustrating the high standard of workmanship and freedom from sand holes a range of castings is shown. Quite a special feature of the display is the application of ceramic enamel to bronze. This is seen in the various letters used on name plates for banks and commercial buildings, the letters being cast with recessed faces and filled with enamel fixed into the lettering.

The different types of reinforcement manu-tured by **Messrs. Johnson's Reinforced Con-te Engineering Co., Ltd.**, of Manchester, are played in a practical manner, and many otographs of large works in which they have n used are on view. The "Lattice" mesh re-rcement, designed for floors, roofs, walls, ds. &c., is supplied ready for laying; the eedon" system is for locking and holding in ition mild steel rods in beams and columns; ricktor" is a useful reinforcement for brick concrete block work where light construction, ch the additional strength imparted by the forcement renders possible, is a consideration.

ones & Attwood, Ltd.—This firm's "Domes-tum," "Hortikatum," "Batheater," "Cul-tum," and other boilers comprise a range ot-water supply apparatus covering all the ied requirements met with in different sizes classes of houses. The "Domestikatum" vides abundance of hot water for all house-l requirements; the "Hortikatum" meets needs of large horticultural schemes; the atheater" is a combined boiler and hot-er storage cylinder; and the "Cultivatum" designed for greenhouse and motor-house ting. In addition to boilers for all purposes, firm specialises in pipes, connections, and ings of every description, representative ibits of which are included in the display. ew design pipe-cutter is also of interest.

. C. Jones & Co., Ltd.—Recently this firm seriously taken to the construction of very t steel frame buildings, and that which forms housing for other exhibits demonstrates t can be done in this direction. Within a th of 15 ft. no less than seven different ns of roof truss are shown. So popular has type of construction become that a new kshop is being erected at Shepherd's Bush to ble the firm to cope with the demand. ther special exhibit at the stand is a portion eel fire-escape staircase, a direction in which srs. Jones have also lately extended; they ady have in hand some big orders for these. er items shown are builders' and contractors' s of all descriptions, and the firm's portable k, with turntable, lathes and engineers' s.

pparatus and models to demonstrate the uses Pudlo" waterproofer are exhibited on the d of **Messrs. Kerner-Greenwood & Co., Ltd.**, ing's Lynn. These consist of apparatus for ng the resistance of cement discs to permea-by water under pressure; full-size section oring, waterproof on top and the lower part ersed in water, showing that water does not trate past the waterproofing; a length of eware drainpipe jointed with water-fed cement and filled with water; and a rtight tank of thin porous concrete blocks rproofed with a facing of ¼ in. of water-fed cement and sand.

e Key Engineering Co., Ltd.—The principal bit here is a flexible asbestos roofing supplied e form of a roll felt and in various colours. is material a very successful effort has been to get away from the rigid sheet asbestos g. Tests made at the Exhibition for the it of Insurance Companies had very satis-ry results in so far as the fire-resisting ty of the material was concerned. Other its shown on the stand are a very simple ng ball-type steam-trap for radiators and n-heating installations, and impregnated -pulp conduits for light drainage work r protecting country house lighting cables. crete blocks and slabs of different sizes and sition are shown by **J. A. King & Co.**, who xhibit a number of specimens of their rein-d concrete glazing bars and "Ferro-" for pavement lights, which have no ed metal surfaces and are therefore mical in upkeep.

Kleine Patent Fire-Resisting Flooring cate, Ltd., demontrate by actual speci-their well-known system of construction, takes the form of reinforced hollow bricks ted together. This method of construction is specially adapted for floors, roofs and staircases, and is being used to a very large extent in the new buildings now going up in London and elsewhere.

Langley, London.—On this stand can be seen attractive forms of Marseilles roofing tiles, together with Beauvais roofing tiles and Du Nord roofing tiles. The stand is designed by Messrs. Welch & Hollis, architects, 7, New-square, Lincoln's Inn, W.C.

The Leeds Fireclay Co., Ltd.—Burmantofts terra-cotta displayed in a central architectural feature, the construction of which is carried out in several types and finishes of terra-cotta, and clearly shows how this material lends itself both constructionally and decoratively to buildings of every class. The plinth of this central feature is in glazed terra-cotta of a dark neutral blue shade, while the piers and arches are in "Texture Marmo," the caps being picked out in gold. This "Texture" finish is a new application of permanent colour to architectural treatment, and furnishes a pleasing method of brightening interior as well as exterior surfaces. The chequered superstructure is crowned by a lettered frieze in golden crimson. A display is made of the Burmantofts "Lefco" terra-cotta fireplaces, combining economy, beauty and utility.

The Lewbank disinfector of the **Lewbank Manufacturing Co., Ltd.**, provides a simple, efficient and economical means of cleansing and deodorising the lavatory pan. It is automatically operated by pulling the chain. Extremely simple in construction and necessarily economical due to its automatic character, it can be easily fitted by any handyman.

Machines for making concrete or cast-stone products of a size up to 8 ft. long by 2 ft. wide by 12 in. deep, or a number of smaller units if the mould be divided, are shown by the **Liner Concrete Machinery Co.**

Lips, Ltd.—Visitors wishing to become acquainted with burglar-proof strong rooms, strong room equipment, safes, locks and door furniture, should make a point of visiting this stand. There are also exhibited cylinder locks and latches, lever locks, door furniture, door checks, floor springs, and safes. The mechanical working cylinder is an exact replica of the cylinders used in all their cylinder locks.

The London Brick Co. & Forders, Ltd. has built itself a very cosy room of Fletton bricks, which are of course, its main line. Particularly there is noticeable the multi-coloured rough facing brick which has a considerable vogue for housing schemes, where something is required which will not be more expensive than ordinary Flettons, but will break up the dullness of what would otherwise be a very plain surface. The rough-faced bricks are also particularly suitable for string courses and panels. In addition the firm can supply any form of moulded or beaded brick, and many samples of these are to be seen displayed in the kind of floral courtyard which extends before the entrance to the brick erection mentioned. A new departure for this Company is the product of floor tiles from their own special clay, these comparing favourably with the Staffordshire material both in price and quality.

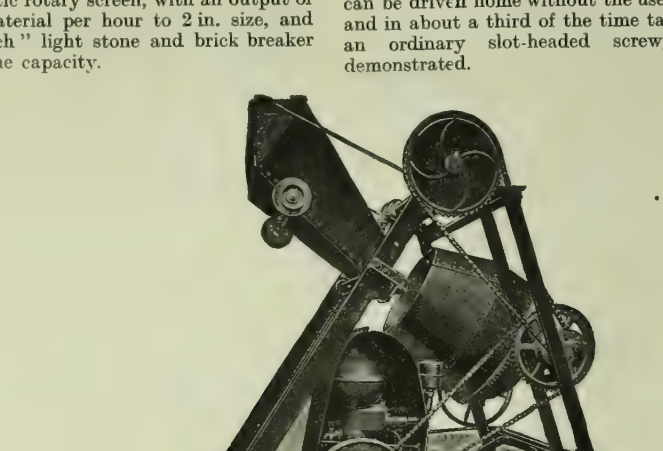
London Sand Blast Decorative Glass Works, Ltd.—This is a comprehensive and attractive display of embossed and decorative glass of all descriptions. There is to be noted some fine specimens of stained glass, also a variety of mirrors for hotel and restaurant purposes. On the front of the stand are a number of internally illuminated signs for shop interiors and exteriors, while in a large show case may be found glass and other advertising novelties. There is a selection of direction plates such as are used in streets and in large official buildings. Mention should also be made of a line of imitation bronze tablets, which being actually made of glass merely require the application of a damp rag for cleaning and, of course, do not suffer from verdigris.

Major & Co., Ltd.—"Solignum," which is shown on this stand, is known as a preservative for all classes of woodwork, and as a preventive and cure for dry rot and other fungoid growths. A special interest is being taken to-day in the preservation of both old and new buildings; and in view of its low cost and easy application, "Solignum" is advocated by its makers as a thoroughly reliable means of ensuring the maximum durability of all timbers used for constructional purposes.

F. McNeill & Co., Ltd.—The strength and vitality of these exhibits are represented by a model of an extremely realistic lion. "Lion" roofing made in various thicknesses and suitable for all climates is shown, together with models illustrating the most economical and efficient method of using these roofings, and are of interest to architects, surveyors, builders, contractors, &c. Here one may inspect at close quarters sections and complete model buildings of various kinds. McNeill's "Combinite" system of roofing for flat or sloping roofs is also shown. Models of McNeill's "Slagbestos" can be seen and illustrate its fireproof and sound-proof qualities.

John Macquire.—Into the hut, the form of which this stand takes, there has been worked the entire range of the firm's special tiling, slating, and asbestos productions. Internally there are to be found asbestos tiles and sheets forming the walls, with special sheets for the ceilings. Externally the firm's special tiling and slating for vertical work is well shown, while on the roof or roofs are various kinds of Welsh and Westmoreland slates as well as ridge, hip and valley tiles. It may be mentioned that there are shown both hand and machine-made tiles, also tiles both smooth and sand-faced.

Mander Bros., Ltd.—A visit paid to this stand enables one to appreciate the pavilion which is illustrative of their well-known decorative paint, enamels, varnishes, &c. The outside scheme of decoration is an exceptionally bold and striking one, consisting, as it does, of columns in black ebony finish, panels in an extraordinarily rich shade of purple (known as cobalt violet) and stiles in a white enamel. The combination of these colours is striking, original and harmonious, in spite of the contrasts. The interior is, on the other hand, of a very much more subdued character, and shows panels of a delicate dove grey, with stiles in a very pale green. The panels are relieved by stencil decoration in an Adam design, and the ceiling with relief decorations. The whole of the decorations are carried out in Mander's "Aqualine" water paint, "Vernasca" wall paint, black ebony finish, and egg-shell gloss enamel.



The Marble Mosaic Co., Ltd.—New to this country is the Florentine (pre-cast marble) floor tiling to be seen on the floor of this stand; the designs are very attractive. This firm has carried out in the entrance to the Olympia Extension and to Lyons' Restaurant work in its "Imperator" (pre-cast marble) composition, while the lavatory divisions required are also in this material. Examples of "Imperator" flooring, staircases and partitions are shown on the stand, as well as the older standard lines of the firm, including terrazzo linolith composition, mosaic work in marble ceramic and floors, and marble work.

Moule's Patent Earth Closet Co., Ltd.—Twelve specimens of Moule's patent earth closets are shown covering the three actions—"Pull-Out," "Pull-Up" and "Self-Acting"—apparatus for fixing in permanent closets, in the house or outside.

The well-known series of machines known as "Parker Plant" is shown by **Mr. Frederick Parker.** There are on view a portable concrete mixer of ¼ yd. capacity, with loading hopper, water tank and engines, mounted as a self-contained unit on a truck. This should appeal to all who require a machine to handle rapidly a moderate output. For other users there is a 4 cu. ft. capacity mixer with a 2½ h.p. engine mounted on road wheels. These machines are simply designed on the revolving dome principle. On this stand there are also

shown the "Monarch" portable stone breaker with automatic rotary screen, with an output of 4 tons of material per hour to 2 in. size, and the "Monarch" light stone and brick breaker with the same capacity.

large variety are shown. Recess screws, which can be driven home without the use of a gimlet, and in about a third of the time taken to drive an ordinary slot-headed screw, are also demonstrated.

MESSRS. FREDERICK PARKER'S CONCRETE MIXER.

Thomas Potterton.—The latest model "Victor Combination" boiler is demonstrated in operation. It comprises a standard "Victor" gas boiler, fitted with thermostat control, mounted above a specially designed coke, or other smokeless fuel, stove. Every convenience is provided for cleaning the coke boiler, including removal of fur, in its fixed position. That is to say, all parts are accessible from the front. Increased efficiency with consequent economy in fuel is secured by provision of a waterway crown with the inner shell of the coke boiler in the form of an arch. The "Victor-Combination" has been specially designed to meet requirements in private houses where a kitchen range is not installed and solid fuel is required for winter duty. One or two hot-water radiators may be used in conjunction with the coke boiler. "Victor" gas boilers and water-treating plants for elimination of lime and other impurities are also exhibited.

Ravenhead Sanitary Pipe & Brick Co., Ltd.—Visitors to this stand will be repaid by seeing interesting examples of handicraft, decorative brickwork, and interior decoration in firegrate surrounds and flower vases, &c. Also an exterior decoration in garden ornaments, sundials, forms, paving, &c.

The Rawlplug Co., Ltd.—Demonstrations are given continuously throughout the day showing the ease and security with which household fittings of every description can be fixed by means of Rawlplugs. Aluminium fittings in

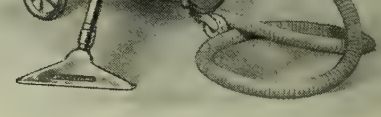
Ronuk, Ltd.—Visitors to this stand will see that the whole of the woodwork of this exhibit has been prepared and polished by the "Ronuk" improved sanitary methods. Demonstrations of simple and scientific floor maintenance are constantly being given, and visitors are cordially invited to ask for full particulars. This firm undertake the maintenance of polished floors; it is not, perhaps, fully realised how essential is the initial work of polishing.

The Ruberoid Co., Ltd.—The Ruberoid Roofing exhibited is a type which has been employed for over thirty years on buildings of all types. It is equally efficient on flat pitched or curved roofs, and can be laid on wood or concrete. It is made in three colours—grey, red and green; these colours are permanent.

Scaffolding (Great Britain), Ltd.—Tubular scaffolding is exhibited on this stand, and visitors are reminded that it is now made in three types. Patent tubular scaffolding (comprising patent sprocketed steel tubes and a patent universal coupler); photographs of contracts where this form of scaffolding has been most successfully used are on view. Demonstrations are given daily, showing the advantages attaching to the use of tubular scaffolding. Hoists and chains are also exhibited. Photographs of contracts in connection with patent heavy and light suspended scaffolding are on view.

Beams illustrating how light is the Siegwart system of concrete floor construction are to be

seen on the stand of **The Siegwart Fireproof Flo Co., Ltd.** The beams, which are hollow an reinforced with steel rods, are made in lengt of 20 ft. or less. They are delivered at si matured and hoisted into position and the joi between them made with cement. So rapid can the floor construction be carried out that a Midland works 800 yds. of flooring are present being laid per week. In addition to t flooring, the roof of the stand is an examp of the Siegwart concrete flat roof, the undersi being roughed to take the ceiling and the t smooth for lead or other roof covering.



The Silicate Paint Co., J. B. Orr & Co Ltd.—The interior of this stand is divided in three compartments, each of which sho varying forms of silicate paint. A door showi the Silicate mahogany varnish contras favourably with much of the work done modern housing schemes. In the gallery front shown in panels a selection of the many Duresc colours now being made by the compan The stand is designed primarily to show practic utility.

Samuel Smith & Sons, Ltd.—A special featu of the "Foresight" combination grate is t provision throughout of cast-iron flues. Thoug more expensive in manufacture, many adva tages are secured thereby. The whole of t gases and smoke being consumed in the flu before passing into the chimney, the usu heavy heat loss from unburnt smoke is reduce to a minimum. A 50 per cent. economy in co consumption is claimed. In the latest improv "Foresight," the flames, after passing und the high-pressure boiler and up the back of t grate, strike the ring in the hob plate over t canopy, pass along the hob plate, in which a two other boiling rings, to the oven flues a thence to the chimney. Slow combusti ventilator under the grate, automatic adjustal canopy for coal consumption regulation, a regulating dampers in the oven flues, a among the refinements embodied in the co bination. The cleverly designed swingi trivet makes it only a matter of seconds to co vert the open grate into a range for culina purposes, or *vice versa*.

Smyrk & Son.—Picture rails as ordinar used are pernicious and unhygienic du catchers, and are a source of trouble to th who are responsible for the cleanliness buildings; also the normal picture hook whi fixes on them has a nasty habit of falli when a picture is removed. Mr. Smyrk, as practical builder, realised these disadvantag and as a result of his efforts to eliminate th has produced the H.S.N. (which means hygie secure and neat) picture rail and hooks. T rail gives a plain, sloping surface on t from which any dust is easily removed. T groove is beneath, and the hooks are spru into position, leaving just the hook port exposed. It is possible with this H.S.N. ty of rail to fix it right up to the cornice.

It is erroneous to assume that "Eterni asbestos-cement materials cannot be used produce artistic and architecturally sou

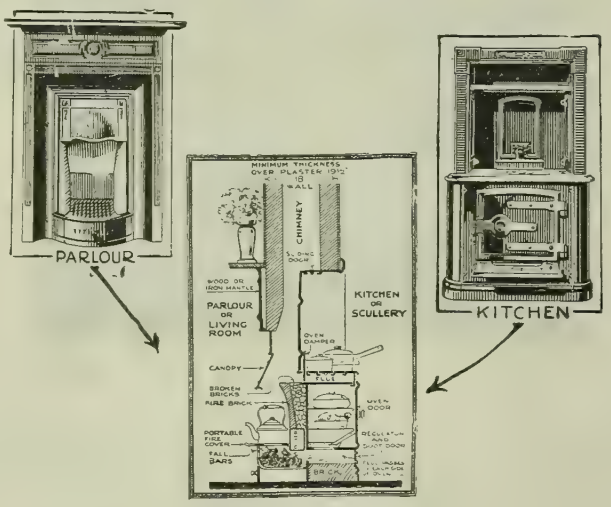
THE "STURTEVANT" VACUUM CLEANER (*See p.* 647).

effects. **G. R. Speaker & Co.** conclusively prove that in combination with timber framing "Eternit" has large possibilities. Externally "Rough-Cast" Eternit sheets are used, the roof is covered with "Eternit" red tiles and internally a plain grey "Eternit" sheeting gives a very restful effect. The recently introduced veneered "Eternit" sheeting is shown as panelling in an ante-room, and looks very effective.

The Spedol Manufacturing Co., Ltd.—This stand, in the New Hall, has a very smart and distinctive appearance. Its design lends itself to the demonstration of the effects which may be obtained by the use of various colours and types of paint and enamel, and good use has been made of this facility. "Stempeau" distemper has been effectively used in parts, while "Spemac" white enamel gives a bright surface to the doors and ledges. Different coloured Spedol paint also is used on a number of panels, while on one side is a special demonstration of "Ferroarmor," which is a rust-resisting paint for exterior use. Apart from the decoration work there are samples and information concerning "Stempeau" distempers and ceiling white, Spedol varnishes and paints, swift liquid driers, brushes, and so on.

Stephens & Carter, Ltd.—A new simple and extremely efficient system of tubular scaffolding is the principal exhibit on this stand. Solid drawn steel tubes are used, with a patent clip which enables braces to be fixed at any angle and in remarkably little time. The patent is here shown for the first time; it is an exhibit which should not be missed. Another special item demonstrated is Carter's (Spencer's patent) travelling cradle, which runs on short lengths of light steel rails which can be instantly connected to form a continuous level track of any length. The method permits the use of the cradles on curved or irregular fronted buildings and obviates the use of long ladders. All kinds of ladders, scaffolding, requisite builders' plant and so forth are also shown on this stand.

Specialists in vacuum cleaning plant, the **Sturtevant Engineering Co., Ltd.**, are exhibiting a fixed set in which a 5 h.p. motor is coupled to a turbo-exhauster. Control is effected through an Igranic automatic push-button apparatus. There are three different pipes leading to connecting points, and there are fittings of all shapes to complete the outfit. For places where it is not possible or convenient to install a fixed set, there is a very handy ½ h.p. portable apparatus, which combines great cleaning power with a lightness which makes it readily portable. A useful apparatus shown also is a small portable electric blowing set, which finds a large field of utility in such work as blowing the dust out of the interior of electric motors and other electrical machinery.



John Tann, Ltd.—Interesting testimony to the fire-resisting properties of John Tann's "Anchor Reliance" safes is furnished by tests carried out by Messrs. David Kirkaldy & Son. The safe tested successfully resisted all assaults upon it by mechanical tools and oxy-acetylene blowpipe. At the end of three days the steel portions of the outer covering were still unpenetrated. Representative exhibits of the firm's numerous specialities are on view.

The Triplex Foundry, Ltd., show a "C" model "Triplex" grate, demonstrated working in conjunction with a 30 gallon hot-water cylinder. A copious supply of hot water for two baths an hour is given. A "G" pattern "Triplex" is also demonstrated. The "Workwell" is an attractive open fire grate suitable for workmen's dwellings. "Adaptable" and "Black Diamond" fires are also exhibited, both of which are adaptable to existing grates.

Tuke & Bell, Ltd.—The chief exhibit on this stand is a country house sewage installation comprising semi-septic tank with fillings and filter, aerobic filter and final humus pit. It is a standard design of proved worth. Watertight apparatus, a water pressure filter, an "Ideal" revolving sewage distributor, and a "Carlton" revolving distributor, suitable for municipal schemes, are also exhibited.

Trafford tiles, which are made in asbestos-cement, are shown on the stand of **Turner Bros. Asbestos Co., Ltd.**, utilised on a small steel-framed building erected by Messrs. Drew-Bear, Perks & Co., Ltd. The combination of large covering capacity with simplicity of fixing of this well-known roofing material is fully demonstrated. In addition the Company is exhibiting the new "Endurol" tile for house roofs; also the "Aegis" asbestos cement roofing slates, and building sheets for partitions, ceilings, and so on. It may be mentioned that the Trafford tiles have been selected for the Stadium covered stands and permanent Exhibition buildings at the British Empire Exhibition.

Allan Ure & Co.—The Ure back-to-back living-room grate and scullery cooker is demonstrated practically. In this combination one fire does the work of two efficiently and economically. The fire is in the living-room grate, and from it the flames pass under the high-pressure boiler at the back direct to the bottom of an 18 in. oven in the scullery on the far side of the partition wall. The hot gases pass up flues on both sides and over the top of the oven to the chimney, giving a uniform heat to the oven. Both grate and oven are made in several different patterns.

The "Ure" Back-to-back Grate and Cooker.

Vulcanite, Ltd.—Visitors to this stand will find that the patent vulcanite roofing is a permanently waterproof surface for flat roofs (wood or concrete), roof tanks, and for waterproofing basements. It is unaffected by vibration, settlement, expansion, or contraction and change of temperature, and models can be seen showing application of the "Vulcanite" process to flat roofs. Roofings are shown as follows:—"Rexilite," "Ark" and "Pyramid" pure bitumen and "Leatherite" and "Apex" felts for roofing, sarking and lining. Also "Reliance" lead and bitumen dampcourse, made on a unique principle. Also "Rexilite" and "Bituna" pure bitumen dampcourses, in various thicknesses, together with examples of Vulcanite sanded asphalt.

The Wallidge "Scaffold Grip" and "Putlog Fastener" are entirely new devices shown by the **Wallidge Building Appliances Co.** The former, it is claimed, enables a saving of at least 50 per cent. in the cost of erecting scaffolding to be effected compared with the usual cord and wedges method. The special feature of the Putlog fastener is that it can be fixed and removed without putlog holes being left in the face of the building.

With the Underground Railways so busy with escalator installation, the working model escalator exhibited by **Waygood-Otis, Ltd.**, attracts attention. It is of the "comb" type, which is rapidly replacing the original "step-off-with-the-left-foot" pattern, which was difficult for the less agile passengers to negotiate. With the new pattern passengers are literally combed off or on; the passenger capacity of a full-size escalator of this kind is 8,000 passengers per hour. A special feature is made of a traction lift machine fitted with a patent micro-drive. This is a power saving arrangement which permits of running the lift at a high speed, and yet stopping dead level at landings without any of the excessive power use and motor wear involved in "inching" up to the level. There is a standard 6/7 passenger lift machine fitted with the new standard controller; also examples of hand dinner lifts, one to work by turning a handle and another to operate with the usual rope. A big business is, we understand, being done by the firm in these hand lifts, as well as in the external lifts for the delivery of goods in tall blocks of flats, and so on.

The Welin Trading Co., Ltd.—"Glasurit" japans, varnishes and enamels are displayed on this stand in the best way possible, *i.e.*, by appearance when used. Apart from a few loose panel pieces, it is worthy of note that the fine effect which has been produced in the decoration of this stand was the work of a first-class workman who had previously not known anything of the "Glasurit" materials. The work is a testimonial both to the man and to the paint, as the design of the stand is to its originators, Messrs. Gatfield & Eller. Some of the varnished panels shown might certainly deceive one into thinking them to be of actual glass, and they are of the highest class of coachwork; a complete range of "Glasurit" varnishes is shown; also an iron "Glasurit" for rust prevention, and "Neutralac" special priming.

The "Well" Fire and Foundry Co., Ltd.—Several complete fireplaces are displayed on an attractive stand carried out in period styles. Particularly noteworthy are the designs carried out in stainless and in rustless armour bright iron and faience blocks, though those in stone, marble, and old English sand-faced Tattershall briquettes will doubtless appeal more strongly to some tastes. But there are artistic designs for all. The patent "Well" fire is composed of well and back brick of finest Stourbridge fireclay. The bottom brick is constructed with ventilating air-channels controlled by two "hit and miss" ventilators. Air entering the grate through these channels is pre-heated. It unites with the smoke, causing it to burst into flame; thus the smoke which otherwise would be lost in the chimney is consumed, and its heating value utilised.

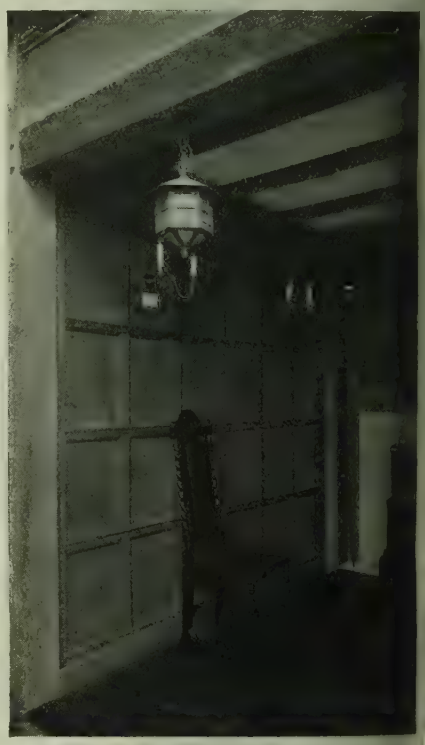
Woco Door Co.—It is some seventeen years since "Woco" Columbian pine doors first came to this country. In the years which have followed they have secured a well-merited reputation for value. As the firm guarantees them to be specially seasoned to resist warping and to be free from knots and defects, this was but to be expected. On the stand the various standard patterns of doors which the firm supplies are shown in a manner which permits

A "WELL" FIRE (*See p. 647*).

of free inspection of the whole. Normally, though those exhibited are shown treated with oak stain, the doors are supplied ready for staining or painting, fitted with leaded or other glass where the design demands it. It may be mentioned that recently in this country the "Woco" door has been specified for many large public buildings as well as for housing schemes.

The Yorkshire Copper Works, Ltd.—Bright copper tubing very artistically arranged is the feature of this stand. Two 18 in. copper tubes support between them a curtain of tubes and patent connections. The firm specialises in solid drawn (seamless) copper tubes for hot-water and domestic engineering work, and in this connection has produced a series of patent fittings which obviate the need for screwing. The largest size of copper piping made by these manufacturers is 24 in. diameter, but for domestic and general building work the normal requirements vary from ½ in. to 2½ in. It is pointed out to enquirers at the stand that with the use of light copper tubing in place of lead or iron saving can be effected in money, labour and time.

What may fairly claim to be one of the best stands in the exhibition is that of **Young & Marten, Ltd.** Ranged along the back is a good array of the well-known "Hue" barless fires, a type of fire which is finding much favour of late. The mantel-pieces in connection with these fires are in general very effective and demonstrate that the firm can supply this portion of room furniture to suit any desired style. The stand floor space is largely occupied by porcelain enamel baths, porcelain wash-basins, and complete lavatory suites. Opportunity is taken to show on the stand walls how large a variety of paper-hangings and room decorations can be provided; while along the front of the stand are shown many examples of turnery—newels, baluster rails, and hand-rails. Leaded lights are another feature which will attract attention, there being some excellent specimens of these. The whole of the items shown are of British manufacture, emanating from the firm's large works at Stratford.



WOODWORK AND JOINERY EXHIBITS.

Associated Crafts, Ltd.—A visit to this stand shows that Dekart is a material that bears the very closest resemblance to oak or any other hardwood. Its initial cost is considerably less than that of the materials it imitates, being about half that of real oak. It is demonstrated that it is possible once again to reproduce at a reasonable cost those charming panelled interiors in conformity with English traditional design. Dekart plaster sheets, tiles and mantels are also exhibited.

Bryce, White & Co., Ltd.—The needs of the modern builder erecting houses under adverse financial conditions are provided for in respect to joinery by Messrs. Bryce, White & Co., Ltd., who are exhibiting sound stock standard pattern fittings in Swedish timber at reasonable prices. It has been difficult, since the war, to obtain doors and windows that are at once cheap and good. The supply of seasoned timber has not been always of a quality to render it advisable for an architect to permit the contractor to get out the joinery, and the purchase of ready-made work clean from the plane has become an accepted practice. One other device of present-day economy is the use of stain and polish as against the old-fashioned routine of many coats of oil paint, and the beautifully figured western pine panelling on show at this stall has the advantage of taking stain admirably. The wood seems to be singularly free from knots and defects and looks well without demanding stopping and expensive preparation.

Charrier and Marbut Carvings, Ltd., exhibit their well-known hard and soft wood joinery enrichments. These admirably executed carvings are produced by machinery with very much of the effect of hand work. The finished surfaces are particularly crisp and clean and need the minimum of touching up before painting, staining or varnishing is put in hand. Some examples of finished work are shown in which the enrichments are used appropriately as borders to panels and in mouldings and cornices. Very large stocks of standard mouldings and enrichments are on hand available for immediate delivery.

Samuel Elliott & Sons (Reading), Ltd, have designed a stall calculated to emphasise the rugged character of English oak as used in the structure and the decoration of buildings. The outside timbers have been given a weather-worn appearance by a deep, if somewhat artificial, striation of their surfaces which is certainly striking. The effect of old age is more artistically obtained upon the interior panelling by the actual play of the adze as in the work of former ages. The grey colour and dark figure of old oak has been very successfully imitated, and the character of the workmanship a pleasure to inspect. Two fine fluted columns of Honduras mahogany with bronze capitals and bases, together with some solid bolection moulded panelling, prepared for the new Southampton Harbour Board, are also exhibited.

INTERIOR OF MESSRS. SAMUEL ELLIOTT & SONS' STAND.

J. Gliksten & Sons, Ltd., have stacked the space at their disposal with large quantities of Austrian wainscot oak, and they are prepared to deliver from stock quantities of this material from ½ in. to 10 in. in thickness and up to 21 ft. in length. Some logs of French walnut from 6 to 11 ft. in length, free from top and root, are also exhibited, and are procurable in ½ in. to 6 in. thicknesses. Large stocks of square-edged wainscot, from 1 in. to 3 in. thickness in 6 ft. to 10 ft. lengths are available, some samples of considerable length being shown. Mahogany is represented by a log sawn into slabs 29 ft. long by 3 ft. in width.

S. Haskins & Bros., Ltd.—This attractive stall exemplifies the methods of up-to-date shop fitting in metal and hardwood. One front, in solid bronze and plate glass, is matched by another in which the bronze is applied as thin but substantial surface plating pressed tightly upon a hardwood core, in both cases finely modelled ornament in cast bronze has been added with tasteful and truly artistic effect. The modelled ornaments have been prepared by a special process which permits of the slightly surface texture of the sand mould being retained and the metal is finished semi-bright in order that it shall need no polishing, but become rich in tone with age, like a good bronze statue. Another face of the stand has been fitted with

MESSRS. S. HASKINS & BROS.' STAND.

" Firola " roller door on the principle of a fire-oof curtain. This door has been accepted for trol dumps throughout Great Britain. To se the roller door it is necessary to lower it o feet. after which it continues to descend wly under the influence of gravitation.

James Latham, Ltd.—The two stands are ed with large quantities of mahogany and ner hard woods. One fine log of Nigerian hogany of good colour and grain reaches the raordinary width of 4 ft. 6 in. in a length of ft. Several smaller logs of Honduras and ne Cuba of varied figure are exhibited. strian and Volhynian wainscot oak are well reserted, as are Japanese and American oak plain and figured cuts. English wainscot oak h its more variable character is also stocked. A ture of the smaller stall is a floor in Mahoborn machined for secret nailing. This flooring of pinkish-brown and resembles African hogany rather than teak, and unlike other ieties of teak has a pleasant aromatic odour. s claimed for it that it wears evenly and well.

MacAndrews & Forbes, Ltd.—This exhibit is practical demonstration of Fiberlic patent lboard for ceilings and walls. This wall-rd is a product which obtains its special lification from the raw material from which manufactured. It is a very rigid board, nomical in its use and artistic in its effect.

William Oliver & Sons, Ltd., include a fine w of valuable hardwood timber on their d. Some of this has been planed to a smooth we, and shows its figure to advantage. the most interesting and spectacular exhibit magnificent oak trunk still mounted upon a er tug. The stick, which is apparently d, is one of the largest of English oak trees, is almost capable of cutting one of the twenty-six hammer posts of Westminster Hall roof—a rare distinction nowadays.

E. Pollard & Co., Ltd.—The combination of wood and bronze in shop-front and show-case work is exemplified in this stand. Moulded sections of hardwood have been enclosed in a superficial layer of metal of 18 gauge; metal and wood being firmly clinched together. The use of Messrs. Luxfers' patent copper glazing within the metal surround is seen in the entrance doors to the stall, where a profusion of lettering and illuminated signs are to be found.

A. C. Rennie.—This stand in decorative Tudor style illustrates the imitation of old English carving in oak in an asbestos composition. The modelling is vigorous and, though it lacks the crisp touch that can only be imparted by the chisel and which must necessarily be lost in cast or compressed replicas, the general appearance resembles the original work to an extraordinary degree. The rough grain of the wood has been painstakingly rendered in the non-inflammable material. The surfaces are coloured a rich brown, and where genuine oak carving is inadmissible this art modelling composition should prove extremely useful.

Rippers, Ltd.—This firm exhibit some high-class joinery in oak and mahogany, both in panelled framing and in veneered work. The modern demand for absolute cleanliness is well supplied in the plain polished surfaces of the hospital doors, which are constructed without a visible frame of styles, rails, and muntins, but appear to be made in a single large sheet of material. This is not the case, as warping and shrinkage would make the course impracticable, and the veneered surfaces are in reality supported upon an internal frame and are surrounded with hardwood borders planed flush with the surface.

VIEW OF JAMES LATHAM'S TIMBER DEPOT.

Although unfamiliar, these large expanses of beautifully figured and coloured material are far from being inartistic and they are eminently suitable for the purpose for which they are intended.

Ten Test Fibre Board Co., Ltd.—" Ten Test " board is a single thickness of compressed fibre with slightly roughened surface, which takes colour in all matt finishes. The boards are made up in sizes up to 4 ft. by 8 ft. by 7-16 of an inch, and it is claimed for this material that it can be safely used for external as well as internal wall finishing, or even for the covering of pitched roofs. The exterior is covered with a slurry consisting of three parts cement to one part water, and in cheap work an impervious paint is considered sufficient. A rendering or stucco is advisable for greater strength and durability.

Thames Board Mills, Ltd.—The Thames Paper Co. have designed their stand with a front in imitation of a dilapidated brick wall from which the plaster has peeled off by way of indicating the advantages of S.X. Board, the British-made wall board, as a material for lining walls and ceilings. S.X. Board is composed of compressed wood fibre, and may be obtained in sizes up to 16 ft. long and 4 ft. wide. A bent sheet in the corner of the stand bears testimony to the toughness and the pliability of the artificial wood, which can be treated with any ordinary paint or distemper. The surface of the S.X. Board is matt and lends itself to interesting colour effects.

The Bath Cabinet Makers Co.—Their stand is well designed with painted decoration of black stencilled frets upon a white ground. Some high-class hard-wood joinery is exhibited, including walnut doors set off with black lines of inlay and a beautifully coloured mahogany mantelpiece.

The Educational Supply Association, Ltd.—To the well-known folding partitions the Educational Supply Association has now added their " Esavian " folding windows by means of which a window opening can be freed of obstruction throughout practically its whole width. The mullions are made to move with the sashes, and the whole arrangement of glazed frames folds up into a very small compass. In this inclement climate some such alternation of open and closed treatment is essential to the enjoyment of verandahs and garden houses—hot climate features which need special treatment here. Office desks and garden furniture are also exhibited.

WOODWORKING MACHINERY.

There is an unusually large and comprehensive display of machinery at the Builders' Exhibition at Olympia. Of these, the wood-working machines greatly predominate. Space does not permit of our reviewing them all in detail, but among the more prominent and interesting of these exhibits are those of Messrs. J. Sagar & Co., Ltd., of Halifax; Messrs. Thos. White & Sons, Ltd., of Paisley; and Messrs. Wadkin & Co., of Leicester.

Messrs. Sagar, whose stand is almost the first exhibit to attract the visitor as he enters the main building from the Addison-road gates, are showing eleven machines, including one of their latest high-speed four-cutter planers and moulders for taking in material up to 7 in. by 3 in.; a single-spindle irregular moulder; a heavy double-spindle shaping, trenching and recessing machine; a double-geared planing and thicknessing machine with sectional feed rollers; an " over-and-under " and a hand-feed planer—the latter with safety block and special guards. In the way of sawing machines, this firm are showing a plain band-saw and two types of circular saw, one being a double-blade dimension saw and the other a radial arm roller-feed machine. They are also showing mortising and tenoning machines. This firm, who have greatly developed the application of the direct electrical drive to builders' machines, demonstrate their latest practice in this respect, about half of the machines shown being fitted for electrical driving.

Not far from the above exhibit is the equally imposing stand of **Messrs. Wadkin,** who are showing eleven machines. Here

again we find types of the panel planer, " over-and-under " and hand-feed planers, two styles of mortising machines for builder's work, viz., the combined chain-cutter and hollow chisel mortiser, and the chain-cutter alone. An interesting new model light tenoner with several new adjustments for speed and facility in working, band and circular saws, and a single-belt sander are also shown. A feature in one of the saw benches is that its standard is built on an improved design which so protects the lower portion of the blade as to make it conform to the new Home Office regulations without necessitating any additional apparatus to the machine. A very light and practical single-spindle shaping machine is also worthy of mention.

Near the farther end of the main hall is the exhibit of **Messrs. White.** This occupies the largest stand of any of the wood-working machinery displays. A very good all-round selection of builders' tools is shown here, but the feature which attracted us more particularly was the " Straight Line " edging bench with travelling chain bed and special feed rollers, and with the blade revolving above the bench. This more than doubles the output as compared with the ordinary type of edging bench, and it is the first time we have seen a machine on this principle made by a British firm, although somewhat similar machines have become popular in America. We notice, however, that the White machine possesses certain improvements on the American designs, tending to accuracy and rapidity, as in the British machine both front and back rollers are driven and white-metal bearings are replaced by ball-bearings.

The other feature at this exhibit is their new high-speel four-side planer, in which, among other improvements, a patented system of loose spindles is introduced so that the cutter-blocks may be readily removed from the machine for setting. The makers claim that a saving of fourteen hours a week is made by this arrangement in the effective working time of this machine. Messrs. White are also showing an improved arrangement for the rapid setting of moulding irons and tracking appliances for straight and profiled knives.

Before leaving the main hall one finds near the exit which leads to the new hall the stand of **Messrs. Perkins & Co., Ltd.,** of Leeds. Here is an interesting novelty which is worthy of notice. It is a new attachment which can be adapted to any make of vertical spindle moulder for rapidly and simply cutting stair housings. This firm are also showing a few small wood-working machines.

On entering the large new hall, we find close to the entrance the exhibit of **Messrs. W. & C. Pantin,** of London. Although this firm is best known as one which holds the British representation of several well-established American makers of wood-converting tools, they are showing here only one such machine, an ingenious and portable combined " wood-worker " which embodies in itself the functions of a universal saw, a planer, a drum-sander and a boring machine. The whole is self-contained with its motor on a small pedestal, and each unit is driven independently. They are also showing an ingenious swage shaper and side-dressing appliance for band-saw blades. By far the most prominent feature in their exhibit, however, is a portable belt elevator for loading builder's material on to trucks and other vehicles. This, working in conjunction with a horizontal trough belt conveyor which collects the stuff for the elevator, is demonstrated in actual operation. The makers claim that this plant will handle 30 tons of material in an hour. Parts of a patented gravity roller conveyor are also shown by this firm.

Messrs. A. A. Byrd & Co. are demonstrating a complete range of " Wallace " electric bench wood-working machines for stock up to 8 in. thick. These machines are all complete portable units provided with efficient guards, and should be a welcome addition to the builders' plant.

OLD WESTMINSTER: ITS HISTORIC BUILDINGS PAST AND PRESENT.

UNDER the chairmanship of Mr. Otho Nicholson, M.P. for the Abbey Division of Westminster, the first of two lantern lectures on " Old Westminster " was delivered by Mr. Herbert A. Cox, F.C.A., at the Building Exhibition.

The views first shown upon the screen were of a general character, depicting Westminster in the sixteenth century; they were drawings by Brewer, from one of which *The Builder* model of " Old Westminster " was made. These showed that the island of Bramble or Thorney Isle was, as either name implies, surrounded by the Tyburn, which divided at King's-street, one branch of the stream flowing direct to the river and the other passing south and then east, where it turned the Abbey Mill—hence Mill Bank. " Our Palace of Westminster " included the Abbey and the public buildings as well as the royal residence, and all these were indicated on the screen. Two drawings by Hollar of Westminster from the river and of New Palace-yard were also described. The Painted Chamber was illustrated by an old drawing; the wall paintings, which adorned it, dated from 1237, were some of the earliest of purely English art and it is related that they were " painted beyond description." This chamber may be said to have been the birthplace of the Commons, but their first home was the Chapter House of the Abbey for about 300 years. The beautiful Chapel of St. Stephen's College was shown, as depicted by Brewer, at its best, and a brief description was given with detailed illustrations of the decorations, some of which have been preserved. Subsequent views showed the building when it was converted into St. Stephen's Hall for the use of the Commons in Edward VI's reign, after the dissolution of St. Stephen's College. These views, depicting some of the historic scenes of the seventeenth and eighteenth centuries, revealed the mundane character of the hall. It is seldom realised that the Commons were without a chamber suited to their important business for 600 years until in Queen Victoria's reign the present house was built. The original Parliament Chamber, built by Henry II, stood south of the Painted Chamber and was the House of Lords till 1823, when it was pulled down. The vaults beneath it were then found to have been the kitchen of the royal residence; it was there that Guy Fawkes made his preparations; four of the arches were removed by Sir John Soane and placed in his museum, where they may be seen to-day. In 1823, the House of Lords occupied the Court of Requests (also called the White Hall), having been built by William I as the great hall of his palace on the east side of Old Palace-yard. But in 1834 the great fire originated beneath this building, which was destroyed together with the Painted Chamber and St. Stephen's Hall. Some views of the second House of Lords were shown; also of the crypt of St. Stephen's Chapel, which escaped the fire of 1834. Westminster Hall is the principal subject of the second lecture to be held on Thursday, April 24.

THE ARCHITECTS' AND SURVEYORS' ASSISTANTS' PROFESSIONAL UNION.

AT a meeting at the Building Exhibition, Olympia, held under the auspices of the Architects' and Surveyors' Assistants' Professional Union, Mr. Raymond Unwin, F.R.I.B.A., Chief Architect to the Ministry of Health, and Mr. Alfred Clifford discussed the problem facing the Government in its endeavour to solve the housing problem, from the point of view of the architect and client.

Mr. Clifford, in the course of his remarks, said that most people had lost almost all hope of solving the housing problem, and, possessed with the overwhelming sense of despair for which the bad housing conditions of to-day were responsible, had become more and more apathetic to the necessity for expressing their requirements in a home, both as regards its outward appearance and inward convenience.

In conclusion Mr. Clifford suggested that th were two alternatives to consider in arrangi for the solution of the housing problem, init cost and ultimate cost, and unquestionably t latter was more important.

Mr. Raymond Unwin, in dealing with t question from the producer's point of view, s that the greatest influence exerted upon ma character and personality was his environme and in his youth his deepest and most lasti impressions would be received in the ho environment.

It was now proposed by the building indust itself that it could and ought to build 2,500,0 houses during the next fifteen years. realise how far-reaching for good or bad wou be the results, let them consider that if ea house changed hands only once in fifteen ye and the average family per house number only four, and taking sixty years as being t life of the house, by simple calculation th found that 40,000,000 people would have liv in them for an average of fifteen years eac This was a number approximately equal their present population. To embark on su a programme of house-building to encompa this result was immense, and afforded a gre and glorious opportunity for the nation to hou the people well. On the architect and t builder the task they were faced with wou fall.

The space allotted for the subsidised house was 950 sq. ft., and when that was divided u between the living room, parlour, sculler three bedrooms, bathroom, larder and co cellar, they were left with 190 sq. ft. for stair lobbies, thickness of partition walls, and suc planning required the greatest care and atte tion. Some allowed 104 sq. ft. for sculler larder and coals, and said they were too smal others allowed only 45 sq. ft. for the lot.

RENT ACT: TIME LIMI FOR RECOVERY OF REN

AN important question has arisen in t county courts in connection with the time lim imposed by section 8 of the Rent Restrictio Act, 1923, and it has now been set at rest b the decision of a Divisional Court in thre appeals, Lewis *v.* McKay, Algate *v.* Vugler, an Clark *v.* Potter, reported in *The Times*, April 1 Under section 14, sub-section (1) of the Act 1920, any sum paid on account of rent whi is by virtue of the Act irrecoverable by the lan lord, is made recoverable by the tenant, b section 8, sub-section (2) of the Act of 19 imposed a time limit as follows: " Any su paid by a tenant or mortgagor which, und sub-section (1) of section 14 of the princi Act is recoverable by the tenant or mortga shall be recoverable at any time within months from the date of payment, but n afterwards; or, in the case of a payment m before the passing of this Act (July 31, 192 at any time within six months from the pass of this Act, but not afterwards."

The three appeals were all by landlo judgment having been given for the tena in the courts below.

The particulars of each case are not s ficiently stated for us to go into detail, se the present note we confine ourselves to point decided in the judgment in general ter The court found that in each case the summ had been issued well within the statutory pe of six months, but the cases had not b heard within that period because of the gencies of business in the county courts through no fault of the tenants. The c interpreted the term " recoverable " in sub-section as meaning, either that the cl must have been made by issuing a summ within that time limit, or that the sum question must have been deducted by tenant from his rent within the time limi

It will be seen the point is of importa and that a question which must arise frequently has been decided on a comm sense principle.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

ER another Evictions Bill has been introd in the House of Commons, this time by ain W. Benn, the Liberal member for h. The object of the measure is "to pro- the eviction of distressed tenants and to e provision as to claims for reimbursement ocal authorities affected." Captain Benn ined that the Bill was based on the idea ving the tenant security. The tenant was e provided with a certificate, armed with h he would be immune both from eviction from having an eviction order made nst him. By clause 2 the local Poor Law ority was authorised to grant such a cer- te, stating that they had made themselves nsible for shelter for the man and his ndants. It was proposed that the Poor authority should be called on to forward ne Health Ministry, either in England or land, copies of the certificates that had granted and under regulations which d take into account the disbursements e the local authority would be entitled to n a refund of a part of the money spent. was as far as a private member's Bill d go, and if it was not to lie fallow it t be fertilised by an estimate put forward ne Government and approved by the House. power to recommend the granting of public ey rested alone with Ministers of the rn.

ne Bill was read a first time.

ne Standing Committee which is consider- he Rent Bill introduced by Mr. Gardner, a ur member, has adjourned until after er. Clause 1 has not yet been disposed of.

Price of Houses.

r. Wheatley informed Mr. Paling that, pared with the figures for contracts for , 1923, the average increase in the price ilding up to the present was £41 for a parlour house and £68 for a parlour house. highest and lowest prices of houses, ex- e of cost of land, street works and sewers, ded in contracts let by local authorities up arch 1 last, in connection with schemes r the Housing, &c., Act, 1923, were:— parlour houses: highest, £530; lowest, Parlour houses: highest, £615; lowest,

Bricklaying Machines.

answer to Sir F. Hall, Mr. Wheatley he was informed that experiments had made in the design and construction of laying machines, but he was not aware any such machines had been introduced ound practical in the building industry.

Private Builders and the Subsidy.

. D. G. Somerville asked the Minister of h whether his Department had rejected nd, if so, what applications from private rs for the housing subsidy put forward gh local authorities.

Wheatley said that the position under Housing Act of 1923 was that the local rity came to the Ministry for approval general scheme of subsidy to the private r. The builder went to the authority ot to the Ministry. In four cases ap- to general schemes had been withheld se the local authority could not satisfy Minister, as prescribed by the Housing hat the houses to be subsidised under scheme were such as could not be pro- without assistance. The Ministry had consulted by local authorities on in- al cases, but solely on the question er particular houses which had been or were under construction fell within ope of the Housing Act. In the case of 1,700 houses, spread over the country for ost part in very small numbers in in- al districts, it appeared that the houses t comply with the statutory conditions, e local authorities were so advised.

Labour and Housing Schemes.

Mr. Wheatley informed Mr. T. Thomson that instructions were given to local authorities on the passing of the Housing Act last Session with the object of ensuring that full regard should be had to the labour available when submitting schemes for the assistance of private enterprise. These instructions were to the effect that they should only give undertakings to pay subsidy in respect of houses likely to be started within a reasonable time and completed within nine months, and in dealing with applications of local authorities for approval of such schemes only such numbers of houses were authorised as could be rapidly completed.

Unemployment in Building Industry.

Mr. D. G. Somerville asked the Minister of Health if, in view of the unemployment in the building industry, he would give the names of those districts in which it had been found necessary to limit the grant of the subsidy in view of the amount of work in hand or the lack of essential skilled labour in the locality.

Mr. Wheatley said that, as regarded the first part of the question, he thought the hon. member would be aware that in certain essential branches of the building industry the condition was not one of unemployment. As regarded building of houses by local authorities themselves under the Act of 1923, the ordinary practice of the Department was to confer with the local authorities as to the number of houses which might be put in hand at a particular time. Nearly 500 local authorities in all parts of the country were up to the present undertaking building themselves; and the hon. member might take it that in practically all these cases the numbers approved for immediate building were less than the local authorities would desire to put in hand if it could be shown that there were no lack of the essential skilled labour.

The Minister's Plans.

Mr. Lambert asked the Minister how he proposed to supplement the labour employed in the building trade, considering that it had been reduced from 834,000 in 1901 to 632,000 in 1923, and there was a great urgency for building labour both for dwelling houses and industrial purposes.

Mr. Wheatley said he hoped that it would be possible to supply the House with information on this subject in the course of a few days.

Cost of Repairs.

Mr. Wheatley informed Brig.-Gen. Makins that it was not possible to give general figures as to the actual cost of house repairs, as this cost varied with the character and age of different buildings, but the increase in rates of wages and prices of materials used in connection with house repairs would account for an increase in the cost of repairs in the years 1921, 1922, 1923 and 1924 of 170 per cent., 95 per cent., 78 per cent., and 80 per cent. respectively as compared with the year 1913-14.

Assessment Figures.

The Chancellor of the Exchequer informed Mr. L. Jones that the approximate gross annual value of lands, houses, and other property assessed under Schedule A for the year 1922-23 was as follows:—England and Wales, £257,400,000; Scotland, £29,600,000; Great Britain, £287,000,000.

Concrete Houses.

Mr. Hardie asked the Minister of Health whether he was aware that houses built of concrete hollow blocks 16 years ago in Scotland had had less depreciation and repair costs than the neighbouring houses built of stone and brick, and rough-cast; and whether he contemplated building with this system, which brought in men of the mason trade as builders and employed a maximum number of unskilled men in the manufacture of blocks, using the clinkers from refuse destructors.

Mr. Greenwood said that the Minister was aware that concrete construction had in many cases proved satisfactory and he contemplated that where local circumstances were favourable concrete construction in some safisfactory form would continue to be used.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

**** We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.*

Slates.

SIR,—I see by the price-list of slates that Bangor and Portmadoc are all one price in your journal, *The Builder*. I wish to know which are the better slates of the two; or could you tell me how many years the Oakesley slates would wear on a house. Are they good enough for house property?

A. BENNETT.

[REPLY TO MR. A. BENNETT.]

SIR,—There is very little to choose between the merits of Bangor and Portmadoc slates, and opinion in the trade varies upon the point. The blue slate termed "Portmadoc," which is the shipping port, is quarried at Festiniog, where the quarry inspection is very strict. Those from the Old Vein are considered best, but both the New and Back Veins are reliable. Inferior qualities of blue slates are sometimes passed off as Portmadoc by unscrupulous contractors and for this reason some prefer to specify Bangor, but the real article is in no way inferior thereto.

Oakesley is a thoroughly reliable quarry not far from Festiniog and produces a grey slate. This is perhaps not quite up to the standard of those previously mentioned, but of a wearing quality that may be classed as practically everlasting if well laid and protected from unfair traffic during roof repairs, &c.

"INTERESTED."

Fireproof Screen for Theatre.

SIR,—Can you please give me particulars of the cheapest fireproof screen suitable for a cheap theatre. I have been informed that ordinary sail-cloth treated with saltpetre, say twice a year, makes a cheap fireproof screen, or a sail-cloth curtain treated with asbestos fireproof liquid. In the case in hand it is necessary that the curtain be cheap and able to be rolled instead of flying, as there is not the height for flying, and it should be approved by the local authorities.

A. H. FENNELL.

[REPLY TO MR. FENNEL.]

A sail cloth screen, treated periodically with asbestos paint or tungstate of soda, will answer the purpose of a fairly effective fireproof screen for a theatre. We have had no experience of treating with saltpetre, and are doubtful if this would be efficacious. No pliable screen can be as effective as a solid screen, and some authorities will insist on the latter. The most effective arrangement for a rolling screen is with the roller at the top and the bottom weighted with an iron rod, and with the edges arranged to run in a deep groove formed with slabs of asbestos so that no gaps will be opened up under the influence of draughts playing upon the screen. This arrangement is better than the usual bottom roller, which makes it difficult so to protect the edges. It will, of course, be advisable to consult the requirements of the local authorities before making definite arrangements as regulations vary considerably in different districts.—M. H.

"Swept Tiling."

SIR,—Would you kindly give me the definition of "Swept Tiling"?

J. A. COOK.

THE BUILDING TRADE

REPORT OF THE BUILDING INDUSTRY ON THE PROVISION OF HOUSES

On Friday last week, the "Report on the Present Position in the Building Industry with regard to the carrying out of a full Housing Programme, having particular reference to the means of providing an adequate Supply of Labour and Materials" was issued by H.M. Stationery Office (price 9d. net).

The report has been prepared by the National House Building Committee (representative of employers and operatives in the building trades) formed at the request of the Minister of Health and the Minister of Labour that the building industries should consider the matter and report accordingly to the Government. The publication also contains a report prepared by a Committee of Building Materials Manufacturers and Suppliers formed at the request of the Minister of Health.

The Committee was formed representative of all sections of the building industries, as follows:—

Chairman: Mr. W. H. Nicholls (National Federation of Building Trades Employers).

Vice-Chairman: Mr. T. Barron (National Federation of Building Trade Operatives).

Employers' Representatives: Mr. A. Andrews (National Federation of Master Painters), Mr. H. Blackman (Secretary, Institute of Plumbers), Mr. R. B. Chessum (National Federation of Building Trades Employers), Mr. J. Clark (National Association of Master Plasterers), Mr. J. P. Cox (Institute of Plumbers), Mr. J. Croad (National Federation of Building Trades Employers), Mr. C. E. France (Master Slaters' Federation), Mr. A. J. Forsdike (National Federation of Building Trades Employers), Mr. J. C. Gilchrist (Scottish National Building Trades Employers' Federation), Mr. F. G. Hodges (National Federation of Building Trades Employers), Mr. H. T. Holloway (National Federation of Building Trades Employers), Mr. E. W. King (National Federation of Building Trades Employers), Mr. H. Matthews (National Federation of Building Trades Employers), Mr. A. Melville (Scottish Building Contractors' Association), Mr. H. R. Selley (National Federation of House Builders), Mr. T. Somerville (Federation of Scottish Master Plumbers), Mr. E. J. Strange (National Federation of Building Trades Employers), Mr. A. G. White (Secretary, National Federation of Building Trades Employers).

Representatives of National Federation of Building Trade Operatives: Messrs. J. F. Armour, A. G. Cameron, W. Coles, Wm. Cross, G. Haines, G. Hicks, H. McPherson, D. Merson, S. Sigsworth, S. Taylor, W. Turner, G. Waddell, R. Wilson; Mr. R. Coppock (Secretary, National Federation of Building Trade Operatives).

The Secretary to the Committee was Mr. B. H. Rogers (Ministry of Labour).

Four sub-committees were formed. These were: The General Purposes Sub-Committee: the Materials Supply Sub-Committee; the Labour Supply Sub-Committee; and the Scottish Sub-Committee.

Meetings of the full Committee and of the various Sub-Committees were held from day to day. Meetings also took place with representatives of building material manufacturers. The Scottish Sub-Committee also made a detailed inspection of certain Scottish housing schemes with a view to a comparison of costs with English types of housing schemes.

After some remarks on the causes of the shortage of building trade labour, the report states:—

"The Committee considers it is primarily necessary to restore the confidence of both employers and workmen in the future of the industry by providing the most stabilised conditions possible in regard to the demand for building work for a prolonged period. The Committee, therefore, recommends that the further housing proposals of the Government should be based upon a definite continuous programme of 15 years.

"From information supplied it is understood that under the 1923 Act there are about 40,000 houses being built per year, and the Committee suggests that the new proposals should provide for a further 50,000 to be built the first year, increasing by further increments of houses per year until an extended maximum of 225,000 houses a year are reached, and maintained at that level until towards the end of the 15-years' programme.

"The Committee is of opinion that houses are being built to-day at the lowest possible cost.

The Need for Guarantees.

"At the present time the existing skilled personnel of the industry is in most sections of the trade fully occupied with the current demand for building work; indeed, there is evident a pronounced shortage of labour in certain sections. It is not, however, to be inferred that by limiting the current demand a sufficient amount of suitable labour would be released and made transferable to house building, or that the supply of materials would thereby be rendered easy, the fact being that the labour and much of the material used in ordinary commercial building is unsuitable for house building and could not readily be so diverted. The Committee is definitely of the opinion that in the interests of the community there should be no restriction on private or commercial work, the continuance of which is necessary in order to employ large numbers of craftsmen who would otherwise be unemployed, and such restriction could not facilitate housing production. The organised workers view with apprehension the prospect of increasing the skilled personnel of the industry, and feel that they must have the completest assurances possible that such an increase will be satisfactorily absorbed, and that future demands for their services will be maintained at an adequate level. The Committee unanimously recommends that Parliament should be asked to sanction the expenditure required for a definite and continuous programme extending over 15 years for the erection of an inclusive total of up to, approximately, 2,500,000 houses upon a basis of cost to be agreed.

A National House-Building Committee.

"The local authorities will have to make their housing needs and intentions known to the Government, to the industry, and the manufacturers as far ahead as possible, so that the output of materials may be increased as and where necessary; their transport provided for, the recruitment and training of the necessary labour set going and directed to the proper localities, and the necessary financial commitments arranged for. The Committee, therefore, recommends that provision should be made, in the legislative proposals which may be required for the proposed housing scheme, for the setting up of a National House-Building Committee, comprised of representatives of the organisations referred to under the Chairmanship of a member of the building industry. Such a Committee to be given a status, and a permanency, which would enable it to deal with everything arising within the industry connected with the exercise of its functions under the housing scheme, and to have its expenses paid out of funds to be provided by Parliament.

"The Statutory Committee so set up be given power to obtain any infor which it deems necessary from housin tractors and others. Its proceedings sh given the requisite amount of publicity sure the maintenance of public confiden should be consulted in regard to the co tion of design as affecting economy struction, as to the method of obtainin petitive tenders and of placing contrac as to the method of ensuring prompt set of accounts. This last item is one siderable importance, because there ha much and, it is believed, undue delay, taining the settlement of housing a under previous housing schemes.

"It is the opinion of this Committ the best way of obtaining an adequate of labour for the new housing scheme, ally in the earlier stages while the in apprentices are being trained, will be to the housing contracts over the largest numbers of employers. This will invo placing of contracts to suit the capac the smaller employers. The Committe that the success of the scheme depend enlisting the enthusiastic support of eve of private enterprise, so that employe eagerly strive to participate in house-b and in the training of the additional which is an essential condition of succ

"It therefore recommends that eve cedure should be simplified as far as to that end. At the same time the ment should be empowered to preve voluntary effort which is an essential of these proposals from being weake defeated by indifference, hostility, or i opposition from whatsoever quarter proc

Labour Supply.

"Attention has been given to the q of labour supply under the following ings:—

"(1) Supply of labour at present a for commercial work and housing wor

"(2) Estimated shortage of labour, regard to the proposed housing progra

"(3) Suggested means whereby an a supply of labour may be available suffi guarantee the carrying out in full of t posed housing programme.

"The figures supplied by the Min Labour, representing the number of persons, indicate that, at the dates me there were in each trade the following of workmen:—

	Dec. 1913.		Oct. 1921.	Ja
Carpenters	126,780	...	132,260	...
Bricklayers	68,920	...	62,170	...
Masons	38,870	...	22,880	...
Slaters	6,650	...	5,370	...
Plasterers	20,180	...	17,080	...
Painters	130,860	...	115,900	...
Plumbers	36,860	...	35,840	...
Totals	429,120		392,500	

"These figures plainly show that, s comparatively, there is a distinct sho bricklayers, masons, and plasterers.

"There is a general feeling that as the ship-building and other industries ing large quotas of joiners' and pl labour become active again, there will evident a pronounced shortage of ca and joiners, and also of plumbers. also be borne in mind that the hours w 1914 were considerably longer than the working hours of the present day.

"The Sub-Committee on Labour Su come to the conclusion that for the fi 50,000 additional houses is the maxim ber possible under most favourable stances. Upon the assumption that enterprise and local authority sche producing 40,000 houses per year, t production required to yield a total of

ses a year at a period would be 85,000. ut 57,230 craftsmen, it is estimated, would required for work on the additional 85,000 ses.

The Committee does not think it possible withdraw that number of men from the ting personnel of the industry and to sfer them to housing, having regard to the ent state of demand for craftsmen's labour he industry. It is recognised, however, there is no other available source from ch to draw them. The Committee there- recommends that the maximum pro- mme for the year should be an added pro- ion of 50,000 houses. This would reduce number of men required for the added pro- ion of houses to 58.8 per cent. (say 60 cent.) of the number required for the pro- ion of an additional 85,000 houses, and the bers would be approximately:—

Bricklayers	11,772
Carpenters and joiners ...	7,848
Slater, tiler and plasterers ...	7,848
Masons, painters, plumbers, gasfitters	6,870
Labourers	25,500
	59,838

It must be borne in mind that, as com- d with the other classes of building work. sing is not the most attractive class of k to building trade craftsmen. It must also ecognised that employers will not willingly with workmen already in their employ- t, nor will workmen readily leave their ent employers. It is further pointed out employers will not cripple their productive er by parting with the men they have ered about them as the result of prolonged tion. The Committee are, therefore, ly of opinion that to attempt to allocate ing contracts to employers who, in order an them, would require to attract extra ur to themselves, which extra labour could be obtained under present circumstances he expense of other employers, would be a se of action which would be resented by employers whose labour personnel was to hus depleted. No doubt such employers d, in self-defence, do their best to retain men. This might lead, at times, to over- ning of their contracts in order to do so, also to the offering of counter-induce- s.

The Committee has, therefore, come to the usion that the best way to secure the fer of the requisite labour, on to work in ection with an extended housing pro- mme, will be to distribute the contracts, d over the largest number of employers ble, preferably to those already located e districts in which houses are to be d, and that every opportunity should be to the smaller types of employers to take housing contracts by making the acts small enough. The Committee de- to lay the greatest stress on this recom- ation, believing that its adoption and rance is a *sine qua non* for the successful hing and prosecution of the housing pro- .

Augmentation of Labour.

Hitherto the augmentation of labour in the g industry has been left in the hands dividual employers in each locality, d at times by the operatives acting with employers on local joint apprenticeship mittees.

ocal agreements between operatives and yers generally exist, providing the upper of age (usually 16) at which appren- may be taken; that they must be inden- and that they must not exceed a certain in relation to the average number of men employed by the individual em- who desires to take apprentices (usually oportions vary between 1 in 4 to 1 in 7); mes a maximum total number for any ployer is imposed (in the case of Man- r and London it is 8). For a long time e Employers' Federation, with the ap- of the Operatives' Federation, has urged upon its members the need that the employers should take the fullest number of apprentices allowable under the rules, but the request, while it has in many cases been complied with, has, on the whole, not met with an adequate response; as may be inferred from the fact that the census figures of 1921 showed that there were then in training only about 21,000 apprentices for the crafts of bricklayers, masons, carpenters and joiners, slaters and plasterers, whereas if an average of 1 in 4 be applied to the figures given at the beginning of this report it will be seen that upwards of 56,400 apprentices should be in training in those same five trades.

"The national organisations of employers and operatives concerned can, in the present circumstances, only use moral suasion in the direction of speeding up the augmentation of the labour supply under the present local autonomy arrangements. The National Federation of Building Trade Employers and the National Federation of Building Trade Operatives, however, have recognised the necessity of using all possible influence to ensure an adequate number of apprentices being taken by employers, and have recently appointed a National Joint Apprenticeship Committee to examine the situation and propose measures for its amelioration. The Committee strongly recommends that the work of that National Joint Apprenticeship Committee should be expedited and that among its proposals should be found provisions for establishing joint apprenticeship committees of employers and operatives in every locality where both sides are organised, whose mission it should be to stimulate, in every possible way, the engagement of apprentices up to the limit provided by the existing working rule agreements, together with the removal, for a time at least, of the restrictions as to the number of apprentices which any one employer may have, so long as the total number of apprentices in a given district, when compared with the total number of craftsmen of any trade concerned who are employed in the district, does not exceed the ratio prescribed by the existing rules. The registration of every apprentice is also required.

"The Committee proposes that, in addition to what has been recommended above, it should be made a condition of every contract for houses under this scheme that the contractor shall employ upon the work, under such contract, apprentices up to a total ratio of one apprentice to three craftsmen, in each of the following trades, viz., bricklayers and masons, carpenters and joiners, slaters and tilers, plasterers, and plumbers. (This does not mean one to three of the men on the contract; but in the trade in the district.) Such apprentices to be indentured under an approved form of indenture in such a manner that they shall be under the supervision of a local joint committee of employers and operatives, and shall be transferable by that committee wherever possible, should the contractor discontinue housing work, and also in order to secure continuity of training and employment. Such apprentices to be similarly registered. The Committee recognises that part of the difficulty at present apprehended in launching the present housing programme is the want of balance between certain trades (*e.g.*, the relative shortage of bricklayers and plasterers), and as this discrepancy should be rectified, the Committee recommends that instruction should be given to the local apprenticeship committees to exercise a certain discretion as to the number of apprentices in the respective trades until the balance is adjusted.

"The Committee further recommends that these apprentices be accepted up to 20 years of age. Special consideration shall, however, be given to applicants who have had previous experience of the trade (*e.g.*, building trade labourer). That apprentices so entering the trade prior to their twentieth birthday shall serve not less than four years, subject however in exceptional circumstances to their right to apply to their local joint committee to pass a test as qualified craftsmen after three years' training.

"The following scale of payment is recommended for apprentices under this scheme:—

First	6 months	40%	of the journeyman's wage.	
Second	,,	45%	,,	,,
Third	,,	50%	,,	,,
Fourth	,,	55%	,,	,,
Fifth	,,	60%	,,	,,
Sixth	,,	65%	,,	,,
Seventh	,,	75%	,,	,,
Eighth	,,	85%	,,	,,

Cost of Labour.

"It is understood that maximum costs will be agreed upon as part of the general housing scheme. Such estimates will necessarily be based upon the circumstances prevailing at the time they are made. The Committee has therefore considered it advisable to indicate shortly certain factors, affecting such estimates, which may vary during the progress of the scheme and have an effect upon results.

"Bearing in mind the adverse effect upon the building industry of certain employers seeking to take advantage of a shortage, or surplus of, labour by varying the wages payments according to the state of trade, the Committee is strongly of opinion that, in the case of contracts placed under the Government housing scheme, it should be made an offence to pay either more or less than the agreed standards for monetary payments. In the case of contracts involving the expenditure of Government money, that object could and should be secured by a suitable provision in the contracts, but legislation would appear to be necessary fully to protect the interests of all concerned.

"The values given in the Report by the Committee are based upon the current output, and depend upon its being maintained. Experience of recent years has shown some remarkable variations in the rates of output, and although, so far as the Committee can see, there is no sudden change to be apprehended, it is thought advisable in this connection to mention the possibility.

"There is also the question of the economic value of the augmented labour, especially during the earlier stages of the scheme, which might affect the prices which could be quoted.

"The Committee is very desirous of obviating, as far as practicable, the transferring of labour from district to district under this scheme. Experience has shown that such a process is very costly. The Committee therefore again emphasises its previous remarks as to a suitable distribution of contracts over the available employers of each district, which, in its opinion, will obviate to a great extent the need for transferring labour from one district to another. This carries with it, however, the implication that in letting contracts over a given district the aggregate number of houses let should harmonise with the labour available in the district.

Machinery for Managing the Scheme.

"The time at the disposal of the Committee does not permit the working out in full detail of the machinery necessary for managing the scheme, but a general idea may be given of what the Committee has in mind.

"It is understood that a Statutory Committee having certain powers will be established as part of the legislative proposals of the Government and will have the general oversight and direction of the scheme. It is also evident that the National Joint Building Committee will require to have subordinate local committees as its active instruments for giving effect to various matters in the localities where houses are required to be erected, and in particular to deal with labour supplies and the provision of the additional apprentices required. Such local joint committees should be composed of representatives from the local employers' and operatives' bodies concerned who are represented upon the National House Building Committee. The size of the local committees, and the distribution of representation to be arranged locally, as may be found convenient, having regard to the area and size of the operations contemplated. The

expenses of operating the Local Committees to be borne jointly and in proportion to representation. Appeal in case of dispute to be to the National House Building Committee or any Sub-Committee appointed by it to deal with such matters. The local committees to be charged with the duty of keeping a register of all apprentices taken under the scheme; for approving applicants; for ascertaining the total number of apprentices held by any applicant employer; and for seeing that a suitable probationary period is provided for each apprentice prior to his being indentured. The local committees would ascertain also the available local supplies of suitable youths.

"The Committee suggest that, in the first case, the local authorities shall notify the local joint committees of their application for Government grant under the Housing Act. Immediately the contract has been placed with the contractor, or a sanction given for subsidy payment to a private individual, notification shall at once be sent to the same joint committee. It shall be an instruction to the contractor to notify the local joint committee of the number of men he intends to employ on the contract, making application for the necessary further quota for the housing contract. It shall be the duty of the local joint committee to see that the provision of the necessary apprentices under this scheme is forthcoming.

"It is understood that the respective trade unions concerned will facilitate the admission of apprentices taken under this scheme into their unions under an appropriate rule.

"A standard form of contract should be arranged containing provisions which will enable the local committees to carry out their duties under the scheme.

"To enable the applicants to be placed upon housing contracts it will be necessary for a certain amount of co-ordination to be arranged between the local authorities and the local committee, so that the latter has information of the placing of each contract. As that might not cover the whole of the ground, every proprietor, who receives a subsidy in respect of houses which he proposes to place for building with a contractor, shall utilise with such contractor the form of contract referred to above. In the opinion of this Committee every effort should locally be made to facilitate technical training of indentured labour.

"It will be the function of the Local Joint Committee, with such national joint guidance and assistance as will be necessary, to provide the amount of augmented labour, varying from time to time, according to the increased demand, so that the undertaking to build a certain number of houses each year will be carried out. This will involve the careful revision of the Labour supply at frequent intervals.

Materials.

"It is roughly estimated that for the provision of 50,000 houses additional to housing schemes already in progress or under consideration (*i.e.*, 40,000 under the 1923 Act) the additional materials required will be:—

Bricks (18,000 per house)	...	900,000,000
Boilers or Coppers	...	50,000
Grates (5 per house)	...	250,000
Timber	(Standards)	125,000
Cement and Lime	(Tons)	245,000
Baths	...	50,000
Back Boilers	...	50,000
Pedestals	...	50,000
Lavatory Basins	...	50,000
Slating and Tiling	(Squares)	335,000
Lead	(Tons)	15,000

"The Committee is of the opinion that the supplies of materials available at the present time do not indicate any considerable amount of reserves. It is also felt that this position tends to cause a rise of prices. As regards certain materials, particularly in the case of bricks and slates, it is probable that there is an actual shortage existing at the moment in some districts. The fact that there is at the present time a pressing demand for similar materials for building work other than housing must, it was felt, considerably affect the market as regards the prices of materials required in connection with housing schemes. The Committee has been making investigations into the possible supplies of coal in the near future, coal being a large factor in the cost of most building materials, particularly bricks. Investigations are also being made into the available supplies of lead and the possibilities of increased supplies in the future.

Estimated maximum output of houses per year.

"The Committee is of opinion that under the most favourable circumstances, and allowing for no increase in building and other new housing, the maximum number of houses that could be built would be:—

1925	...	90,000	1930	...	150,000
1926	...	100,000	1931	...	170,000
1927	...	110,000	1932	...	190,000
1928	...	120,000	1933	...	210,000
1929	...	135,000	1934	...	225,000

"These figures, allowing for the five further years (to make up the 15 years' programme) maintaining a production of 225,000 houses per annum, represent a total of approximately 2,500,000 houses, an average of 170,000 houses per annum. The figures given are inclusive of houses built under the Housing Acts whether by private enterprise or otherwise.

"The Committee considers that it may not be possible to reach this standard of production owing to circumstances over which the industry has no control. It is prepared, however, to undertake that the minimum production would be two thirds of the figures given above, because it will take necessary time for the scheme to get into working order, and for the augmented labour to reach the standard of efficiency required. Allowance must, therefore, be made for this.

Augmentation of Materials.

"The Committee feels that the amount of the increased supplies of building materials which should be produced should not be limited only to such increase as is essential for the housing proposals, but that an effort should be made to enhance the available supplies above that standard, in order that the anticipated increased demands of building work other than on houses should be readily complied with.

"It is put forward for consideration that, in order to assist the carrying out of the full proposals, the State should make the necessary provision to enable facilities to be given to meet approved applications for capital, it is felt that, not only would reasonable facilities in this direction considerably assist in the expediting of housing work, but also that actual economies would thereby be effected.

"The Committee desires to suggest that the State should take such steps as will ensure that all the various manufacturing facilities in connection with building trade materials which were being carried on prior to the war, should resume their operations as far as is found possible. It is further regarded as being entirely essential to the successful carrying through of the housing proposals that the augmentation of the supply of building materials for housing schemes should not be allowed to affect adversely the ordinary requirements of the building industry apart from housing. The Committee strongly feels, therefore, that there should be a sufficient increase in the supply of building materials in order to meet adequately the growing demands both in the case of the housing programme and in the case of the expansion of purely private building enterprise, otherwise the calculations upon which the housing proposals have been based may be seriously affected, and difficulties may arise which it would seem could well be avoided by due consideration of the length of the programme involved.

"With undertakings for an increase in the ranks of certain classes of building trade operatives there must also be similar undertakings that the materials shall be available for the continuous use of the added labo The manufacturers of materials have giv their best assurances that an adequate sup will be forthcoming, and that arrangeme will be made for a greatly increased supply meet the full requirements of the housing p gramme.

"The Committee also desires to emphas that with the increased production it sho prove that the unit cost would be reduced

Prices of Materials.

"The Committee recommends that, for purpose of dealing with outstanding attem to increase prices, the Statutory Commit under the Housing Act should have adequ authority to examine carefully any sugges increase in the price of materials before s increase becomes operative. It is suggest therefore, for consideration, that every p posed increase in prices should be submit for the approval of the Statutory Commit prior to such increase being allowed to oper The Committee also submits for considerat that the Government should by Act of P liament take such steps as may be conside necessary to prevent any individual or org sation seeking to exploit the situation.

Distribution of Housing Schemes.

"It is essential, in the first place, that supply of labour and the supply of mater should harmonise in any particular distr and that both these elements should be pre in the right proportions to cope with housing needs of that district. It is s gested that on the Statutory Committee sh be placed the responsibility of advising a the general distribution of housing schem in order that a comprehensive view may taken not only of the needs of the district also as to the means of immediately mee such needs without producing a state of tion and unrest which might have unsatis tory results, not only in the immediate concerned, but throughout the whole of G Britain.

Transport of Materials.

"The Committee suggests that the Gov ment should assist in the provision of adeq and economical means of rail transport materials required for use in connection State-assisted housing schemes. In the op of the Committee the freightage charge present in operation should be conside lowered.

Price to Merchants.

"The Committee is of the opinion tha present terms allowed by the various m facturers' associations to distributors or chants admit of revision in view of the f increased demands."

Labour and Housing.

It must be hard for outside observers to a ciate how little concern exists in this co over the entry into power of the first L Government. It is suggested*, for example our new Minister of Health "possesses no s training in the health field," and that placing of untried men in responsible office must give the people of England siderable concern." In reality our new Mi has at least as good qualifications for the p any of his string of predecessors. He has to his present position by his own exer and even those who are most afraid of wi may do admit his uncommon capacity. Ar sees clearly that housing over here is handic by constantly changing policies; but w remains a matter of such importance and such immense possibilities of State expen it is hard to see how it can be saved from a political shuttlecock. We are told how, the forties, doctors pronounced bath-tubs dangerous to health; how in 1843 Virgir a tax of $30 a year on bath-tubs; while i a Boston municipal ordinance made such b illegal except on medical advice!—a use minder of the changeability of our stand

* "Housing Problems." (New York City National Housing Association.) February, 19

THE RENT ACT

Tenant as Landlord.

NTY court decision was very briefly re- in *The Times* recently which ap- o raise a new and important point he Rent Act. The facts are so shortly t is necessary rather to read between s, but so far as we can gather the of a house had sublet two rooms in it tenant, and as he required these rooms occupation of a married son and his o had returned from abroad he had to the court for an order for possession ection 4 of the Act of 1923. No men- made in the report of any question as native accommodation or as to any to either party, so we assume the ion must have been made under section ection (1) (iv), which provides that ive accommodation shall not be a n of an order or judgment for posses- where the landlord became the land- fore June 30, 1922, and the dwelling nably required by him for occupation sidence for himself or for any son or r of his over 18 years of age."

he defendant it was contended that the l not apply to tenants but only to who had bought their houses before es specified in the section (the report is date as June 30, 1923, but June 30, s the crucial date in the Act). The court judge held that where there were nts the tenant was the "landlord" to tenant where, as here, the rooms were ate dwelling-house, and he was entitled ession if he reasonably required the It will be seen the decision must turn meaning of the word "landlord," for on 4, which deals with this question of on; the word owner does not occur, but, contrary, in paragraphs iv and v the ion used is "where the landlord be- he landlord." The expressions "land- and "tenant" are defined in sec- subsection (1) (*j*) of the Act of 1920, clude any person from time to time title under the original landlord or " but in paragraph (*g*) this is some- mplified as follows: "The expression rd' also includes in relation to any house any person, other than the who is, or would, but for this Act, be to possession of the dwelling house, expression 'tenant' and 'tenancy' subtenant and subtenancy, and the ion 'let' includes sublet." Under ph (*f*) it would appear that a tenant ng might, in relation to his tenant, be a "landlord" as deriving title from landlord, but paragraph (*g*) has also onsidered, and it applies the test of ntitled to possession but expressly ex- he tenant.

county court judge, in deciding this t. said it had never been the subject ion in a Divisional Court, and it will the point is one of great difficulty. ision in the county court for the first aces the tenant in the position of a rd" under the Act, and it would seem him in a more favourable position as his subtenant than is the landlord under section 4, subsection 5, of the 1923.

ses of difficulty it is sometimes per- in order to ascertain the intention of slature, to refer to the Acts which have ended or superseded by the Act in and on the point under consideration er Acts seem to throw some light on stion. The Act of 1915 in section 1, n (3), which relates to possession, e expression "landlord" where a s required for his own occupation or specified persons. In 1918 an amend- was passed in very curious terms. It "For the purposes of this subsection ression 'landlord' shall not include son who since March 12, 1916, has landlord by the acquisition of the dwelling house or any interest therein, otherwise than by devolution to him under a settlement made before the same date or under a testamentary disposition or an intestacy."

The Act of April, 1919, is, however, more instructive, for in that Act the legislature dropped cryptic language, and in section 5, subsection (2) dealt with this question as follows: "Where a person who has since September 30, 1917, purchased a house to which the principal Act (the Act of 1915) either as originally enacted or as extended by this Act applies, requires the house for his own occupation or that of some person in his employ or in the employment of some tenant from him, nothing in the Increase of Rent (Amendment) Act, 1918, shall be construed as preventing the Court from making an order for the recovery of possession of the house if, after considering all the circumstances of the case, including especially the alternative accommodation available for the tenant, the court considers it reasonable to make such an order."

The Amending Act of 1918 was repealed by the Act of December, 1919, and the two Acts of 1919 were repealed by the Act of 1920, and that Act, in specifying the dates at which a house had to be acquired, reverted to the expression, "where the landlord became the landlord" in place of "a person purchasing," but the use of the latter expression in the Act of 1919 would appear to afford some indication of what the intention of the legislature really was, *i.e.*, that the "landlord" must be either a purchaser or one who has acquired the house under a settlement or will or in consequence of an intestacy.

In the absence of a decision on the point in the High Court we can only intimate some of the arguments which can be raised on this question, for a decision in the county courts is not even binding on other courts of co-ordinate jurisdiction, and caution must be shown in taking proceedings on the strength of this decision as it stands. It seems curious that this point should never have been raised before, and this fact alone may seem to point to the fact that the Act has not been read generally as giving such a right to possession to a tenant.

Discretion in Orders for Possession.

SIR KINGSLEY WOOD, in an interview with a representative of the *Times*, published in the issue of April 3, is reported as having said that in his opinion there was a case for further protection being given to tenants owing to the difference of opinion among the county court judges in the interpretation of the Act, as regards the discretion to be exercised in granting orders for possession, as some of the judges considered they could take into account the position of both landlord and tenant, whereas others considered that they could only consider whether it was reasonable that the landlord should obtain possession.

Curiously enough the answer to this point is contained in a case Shrimpton *v.* Rabbits, reported in the same issue of the *Times*. In that case possession was being claimed of a dwelling house which the landlord desired for the occupation of his daughter. It is not stated in the report when the landlord had become owner of the house, but the application was made under section 5 of the Rent Act, 1920, subsection 1, as enlarged by section 4 of the Act of 1923. The Deputy County Court judge had held that he could only consider the circumstances of the landlord, and not those of the tenant, but the Divisional Court said that a good deal of confusion seemed to have crept in through no clear distinction having been made between a landlord "reasonably requiring" the premises in paragraph (*d*) of section 5, and the Court thinking it reasonable to make the order under the general words following paragraph (*i*), which govern the making of every order on the grounds specified in paragraphs (*a*) to (*i*).

It held that the fact that a landlord satisfied the Court that he was entitled to possession on any of the grounds mentioned in section 5, subsection (1) (*a*) to (*i*), did not absolve him from the further necessity of satisfying the County Court judge that it was reasonable that the order should be made.

Seeing the divergence of opinion amongst the County Court judges on this point this decision of the Divisional Court is of the first importance. We dealt with this question in our issue of November 9, and in that article pointed out that the general discretion conferred in relation to paragraphs (*a*) to (*i*) had to be applied.

Landlord partially liable for Repair.

THE case Bourne *v.* Litton (1924, 1 K.B. 231), to which we drew attention in our issue November 23 last, has been carried to the Court of Appeal, where the decision of the Court below has been affirmed. The case is of importance as it raises the point as to the increase of rent where under section 2 subsection (1) (*d*) of the Rent Act, 1920, the "landlord is responsible for part and not the whole of the repairs."

The plaintiff, the landlord, had claimed two increases in rent, viz., one of 15 per cent. under paragraph (*c*) of the subsection, and another of 15 per cent. under paragraph (*d*). No question arose as to the increase under paragraph (*c*), but the point raised related to the increase demanded under paragraph (*d*), for it was alleged that the sum under that head had neither been agreed between the parties nor determined by the County Court according to the terms of sub-paragraph (ii) of paragraph (*d*). Some correspondence was relied upon as forming an agreement, but this was ruled out as it followed the notice of increase.

By the agreement of tenancy the defendant agreed to keep all gutters, stack pipes, water closets, gullies and cisterns clean and in good sanitary condition, and to keep in repair all window glass, sash lines and internal taps and pipes, and also to maintain and keep in repair all Venetian and other blinds. The landlord was claiming possession, and the defence was that the rent was not "lawfully due" under section 5 subsection (1) (*a*) and section 2 subsection (1) (*d*) (ii).

This latter paragraph reads "where the landlord is responsible for part and not the whole of the repairs such lesser amount (that is less than 25 per cent. which is allowed in the previous paragraph where the landlord is responsible for the whole of the repairs) as may be agreed, or as may on the application of the landlord or the tenant be determined by the County Court to be fair and reasonable having regard to such liability." It was held by the Court below, and that decision has now been affirmed by the Court of Appeal, one Lord Justice dissenting, that the notice of increase as to the repairs was invalid because the amount had not been determined either by agreement between the parties or by the County Court in accordance with paragraph (*d*) (ii), and in consequence of this the notice required by section 3 subsection (2) was irregular.

The decision of the Court of Appeal is not yet reported at length, and it does not appear that any question was raised in this case as to the nature of the repairs. We drew attention to the really serious feature of this decision in our former note, which is the interpretation to be given to the expression "for part and not the whole of the repairs." In this case the repairs to be undertaken by the tenant was not at all extensive "to keep in repair all window glass, sash lines and internal pipes and taps, and also to maintain and keep in repair all Venetian and other blinds," but it will be seen that a trivial repair to be executed by the tenant might be held to bring the case within paragraph (*d*) (ii), and thus it appears that the only safe course when any duty to repair at all is placed on the tenant is for the landlord, failing agreement with the tenant as to the amount of increase, which is never an easy task with a statutory tenant, to apply to the County Court before giving a notice of increase, a course which involves cost.

NEW BUILDINGS IN LONDON

Strand.—SHOPS.—A building is now being erected at the corner of the Strand and Wellington-street, as an up-to-date modern office building, with shops on the ground floor, and of Portland stone on all three fronts.

The sub-contractors are :—Steelwork, Messrs. Dorman, Long & Co., Ltd.; hollow brick floors, Messrs. F. Bradford & Co.; lifts and electric lighting, The Berkeley Electrical Engineering Co.; heating, Messrs. John Blaikie & Sons, Ltd. The architects are Messrs. Trehearne & Norman. Contractors and building owners are Messrs. F. G. Minter, Ltd., of Putney.

Hendon.—RECONSTRUCTION.—A private house called The Fosters, is now being reconstructed for Messrs. Hornblower & Thorp, architects, of 2, Devonshire-terrace, W. The work entails various additions, reconstruction, panelling and general decorative work. The hot-water work has been placed with Messrs. Benhams. The building contractors are Messrs. Hickman, Ltd., of 10, Great Russell-street, W.C.1.

Wood-lane.—ADDITIONS.—Additions are now being made to "Beaumont Arms" Wood-lane, Shepherd's Bush, by Messrs. Thomas & Edge, builders, of Greenwich. The contract price is £4.075. There are no sub-contractors.

Kensington.—CHURCH.—A new church is being erected at Palace Gardens-terrace, W.8, being the Second Church of Christ Scientist. The building will be the completion of a scheme of which the existing Sunday School building forms part. The frontages will be executed in thin red facing bricks and roof with Lombardic tiles. The steel contractors are Messrs. Redpath Brown & Co., Ltd., and the consulting engineers Messrs. Logan Reynolds & Faber. The architects are Sir John Burnet & Partners, and the general contractors Messrs. Higgs & Hill, Ltd.

Fleet-street.—BUILDING.—A building is being erected at 72–78, Fleet-street, the construction of which is of steel and concrete; it is being erected under the 1909 Act. The front elevation will be of cast stone, and the ground story is of cast granite of a special texture. The steelwork is being provided and fixed by Messrs. Moreland, Hayne & Co., Ltd., whilst the flooring construction is of Siegwart Beams, and the Patent Impervious Stone Co. are the contractors for the special cast stonework. Messrs. Allen Fairhead & Sons, Ltd., of Enfield, are the builders. The architects for the work are Messrs. Herbert O. Ellis & Clarke, of 3, 5 & 7, Old Queen-street, S.W. 1.

HOUSING IN AFRICA

THIS volume* contains collected papers and discussions on subjects relating to housing generally. Among the papers is a stimulating address on "The Architect's Opportunity," insisting upon the application of architectural principles and showing how costs can be reduced by the proper designing of houses. Our own Government scheme is discussed by Mr. Lawrence Veiller, who visited this country some three years ago with a view to studying conditions under the Addison Act. We can hardly agree that the main reason for the exorbitant cost of our Government houses was that bricklayers who had been laying 500 bricks a day before the war were subsequently laying but 200 or 300, but we are pleased to find the author of this paper recognising both that "the by-products of that scheme are worth untold sums" in setting up a standard; and that England is trying to get loose from Government housing since it is "contrary to every sound principle of economics." The main problems and arguments adduced in this book apply as much to England as to America, and prove that the housing movement in this country is only a facet of a world movement proceeding upon identical lines.

* "Housing Problems in Africa." Being the proceedings of the National Conference on Housing, Philadelphia, December, 1923. (New York City: National Housing Association.)

RATES OF WAGES IN THE BUILDING TRA

The following are the rates of wages in the building trade in England and Wales. endeavour is made to ensure accuracy, but we cannot be responsible for errors that may oc

TRADE NEWS.

A full and illustrated description of the new Preston Arterial Road is given in the April issue of "Shepherd's N.E.W.S." The same journal, which is published in the interests of better roads, gives details of a novel road light-house recently constructed on Rood-hill, Congleton; whilst the International outlook on roads is provided for in a feature entitled "The World's Road News at a Glance." Copies can be had on application to Messrs. William Shepherd & Sons, Ltd.

Obituary.

The death took place recently at Bryn Awel, Church-street, Treherbert, of Mr. Evan Davies, builder.

Mr. Thomas Hodgson, of Minthorpe, a well-known Middlesbrough builder, died recently, after a long illness.

Croydon Aerodrome.

rter of a million pounds is to be spent Air Ministry in improving Croydon me. The sites for huge new flight sheds the big Napier D.H. 34 and Handley r expresses will be housed have been out, and actual building is to begin immediately. All the present air s are to be pulled down. In their stoms houses, waiting-rooms, bonded ses, and an hotel are to be erected. ldings will stand in the centre of the ne. A big departure and arrival plat- l be arranged in a complete circle round Passengers will arrive by motor-car ic train from London, and will, after through the Customs house, descend ways leading to the different departure s.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND.

Aberdeen.—HOUSES.—The Corporation Plans' Committee passed plans for 12 houses at an estimated total cost of £9,550, and plans for alterations to existing premises were passed to the value of £5,365.

Longniddry.—CHURCH.—It has been decided by the Church of Scotland to provide a new church and hall for Longniddry, Haddingtonshire. The hall will be erected first and will be so planned that it can be used as a church until the proposed new one is built. The hall will be erected to plans prepared by a Glasgow architect, and will be built of red sandstone.

Johnstone.—WAR MEMORIAL.—The Dean of Guild Court has passed plans for a war memorial in Houston-square, at an estimated cost of £1,000, and a house in Kilbarchan-road, for Mr. A. Cochrane, 42, Hight-street.

Broughty Ferry.—FLATS.—The Dundee Corporation Housing Committee have decided to erect flats at Forthill, Broughty Ferry.

Elgin.—COTTAGES.—The Corporation has instructed the Burgh Surveyor to obtain tenders for the erection of 42 cottages.

Leith.—CLEARANCE.—The Edinburgh Corporation has approved of a proposal to improve the slums under the slum clearing scheme for the Port of Leith, the cost of which will be £386,000.

Dundee.—HOUSES.—The Corporation Housing Committee has decided to erect 24 houses at Loon-road.

Paisley.—COTTAGES.—Plans have been passed for two double cottages at Calside.

Killoholm.—HOUSES.—The Sanquhar and Kirkconnel Collieries, Ltd., has invited offers for the erection of 100 miners' houses at Killoholm near Kirkconnel.—The Dumfriesshire E.C. has decided to erect an infants' school at Killoholm.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Mason...	Brick layers.	Carpenters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-Masons'	Plasterers' Labourers.

KETTERING.—Fire completely destroyed the boot factory of Messrs. Mobbs at Kettering, Northants, recently. The damage is estimated to be fully £70,000.

Building Materials.

Arising out of the presentation of the reports on the housing problem which have just been made by representatives of the building and building materials industries, the Minister of Health recently had a conference with the committee of manufacturers and suppliers of building materials. The committee assured the Minister of their hearty co-operation and of their desire to take every practicable step within their industry to assist in the solution of the present housing difficulties. Among the various points discussed the committee drew special attention to the difficulties created by the present shortage of railway wagons. A number of instances were given of serious delays on housing work arising from this cause, even at the present time, and the great importance of this matter in any extended housing scheme was emphasised.

WARRINGTON MASTER BUILDERS' ASSOCIATION

THE annual dinner of the Warrington and District Master Builders' Association was held recently at the Patten Arms Hotel. The President, Mr. Henry Collin, occupied the chair.

After the loyal toasts had been honoured, Mr. J. H. Smethurst, in proposing "The Town and Trade of Warrington," said he remembered Bridge-street twenty or thirty years ago as a very narrow street. Now it was a wide thoroughfare with buildings on each side which were a credit to the builders and architects who had been concerned in their erection. The extension of the infirmary was an improvement in which he had taken a great pride. It had grown from a small building of 30 beds to a hospital of 100 beds. Various buildings in the town reminded him that Warrington was progressing perhaps slowly, but surely.

Responding, the Mayor said there was no ground for complaint about the progress of Warrington in recent years. During the war period, and for some time after, very little could be done. But for the war, the completion of the circus at Market Gate would have been carried out by now. Above all, the Mayor proceeded, they were anxious to improve the housing conditions of the town. They were very glad that they were enabled to put a contract for 54 houses through. Some people looked upon it as an immense amount of money, but it was only a particle of what they really required to make the people of the town comfortably housed. There were conditions which ought to be remedied, and could only be remedied by an extension of house building. He was a great believer in the enterprise which the builders of this country have displayed. If the builders and architects would assist those who were anxious to house the people in the same manner that they were in years gone by, they would find they would be supported.

The toast of "The N.W. Federation of Building Trade Employers" was given by Mr. F. Warburton, who complimented the officials on the amount of work they performed for the benefit of the industry. He urged that members should attend the meetings and keep in close touch with the work.

Mr. John M. Macfarlane, of Manchester, President of the Federation, in his response, emphasised the critical nature of the present times for the building industry, and spoke of the struggle which would have to be fought with trade unions in the near future.

"The Architectural Profession of Warrington and District" was given by Mr. H. Fairclough, who remarked that the only thing he had had out of housing in Warrington had been experience. At the present time architecture had descended to the deplorable state of architects trying to provide a penny for a halfpenny.

Responding, Mr. T. Curran said the public did not understand the high prices, and that builders' costs of pre-war days did not obtain now. He considered that the recent tenders for the 54 houses were very favourable on the whole. It was rather hopeless to expect the building trade to provide houses to-day in the manner they did formerly, with a Rent Restriction Act in operation. Why one industry should be expected to be general philanthropists for the public, and one industry only, passed his comprehension.

Mr. Ben Talbot, in proposing "The Warrington and District Master Builders' Association," referred to the troubles and difficulties that had arisen with the operatives, emphasising the seriousness of the situation, and the necessity for unity amongst master builders.

The President, in his reply, said the N.W. Federation could rely upon the loyal support of the Warrington Association.

Defective Lifts.

Several men were injured when a lift cable broke recently at Hibernia Wharf, London Bridge, and the lift crashed from the fifth floor to the basement, 50 ft. below.

COAL SMOKE ABA MENT SOCIETY

The Coal Smoke Abatement Society re held their annual meeting at the Society of Arts. Lord Newton, who was e president of the Coal Smoke Abatement So presided. The speakers included Mr. Alden, M.P., Dr. H. A. Des Voeux, M.D Arthur Holbrook, Bart., Mr. G. Bernard Sir W. Napier Shaw, D.Sc., F.R.S., Mr. Simon, M.P., and Dame H. Gwynne-Va D.B.E.

In the course of his remarks Lord N said he could not congratulate the Society their position at the present time. All efforts would be practically in vain unles could induce the Government to embark legislation. In London, although it was a rather clean town, no less than 300 t soot and other deposit fell to the squar during the year. Out of that deposit they construct a tower about three times the the tower of Westminster. The Minis Health cost £23,000,000 a year in sa services alone, and they would suppose th question of smoke, which affected the well of the millions of people, would receive consideration from their hands. The S had done their best, but so far without an great result. He was going himself deputation of Members of Parliament to urge upon the Ministry of Health the ne of doing something.

Mr. G. Bernard Shaw, moving a reso supporting the Coal Smoke Abatement S said that in order to make his life end he had to give up his London house and place in a village in Hertfordshire, whi nothing like so attractive as London ou be. If he went for a walk in London dirty all the time. Englishmen did no washing all the time, but he was an Irishm he disliked it intensely. All his greates had been written in the train between Cross and Hatfield while he was runnin from the smoke of London. Only abou a year when he looked out of his wi Adelphi-terrace could he see that Lo surrounded with a belt of beautiful h should, he said, be possible to see it ev In the Middle Ages London must have most beautiful place. Any mediæval would refuse to live in a nineteenth or tw century town. London was not a bad sp when compared with other towns in this but two-thirds of it should be knocked What was required was a sort of civic co ness in the matter. People should b ashamed of the times in which they liv then they might become more careful.

The resolution was seconded by Dam Gwynne-Vaughan, supported by Dr. Des Voeux, and carried unanimously.

Defective Gas Fires.

At an inquest on a man who recently gas poisoning the Coroner said he was that death was due to carbon-monoxide ing, and he hoped the case would be a wa all users of gas fires.

Dr. Norman Kletz said the post showed unmistakable signs that death to poisoning by carbon-monoxide. T a dangerous and insidious gas, witho which might be inhaled for some time its presence being detected. He th extremely unlikely that an inspector, viously stated, could tell, by having a alight for two or three minutes, whe products were getting away.

Previously a foreman plumber emp the Corporation said he had examine fire and flue. There was virtually nc either up or down the flue, which was one for fires of this description. The the lack of draught was that all the pr the fire got into the room. He came t clusion that there was some obstructi flue.

NEW COMPANIES.

particulars quoted below have been led by Messrs. Jordan & Sons, Ltd., any Registration Agents, of 116 & 117, ery-lane, W.C.2, from the documents ble at the Companies' Registry.

THE BUILDER

JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

CXXVI.—No. 4238. APRIL 25, 1924.

PROFESSIONAL UNITY

WE briefly referred in our last issue to an agreement on the subject of Registration and the absorption of the Society of Architects which has been approved unanimously by the Councils of the Royal Institute of British Architects and the ty of Architects and by a conference of the Allied Societies, hich was subject to the revision of the document by the ty's legal advisers. This revision, we are glad to state, aken place without any material alteration, and we give, 683, the document in its approved form. The agreement o be put before the general body of the Institute as the issue on which the Council propose to take the opinion e electorate at the forthcoming R.I.B.A. election and, of e, the vote may be hostile, though we shall be very much ised if such a satisfactory and scarcely to be hoped for t of the long and difficult negotiations which have taken does not receive the support of a large majority of the rate. If it does, then the general meeting necessary to m the agreement will be held at once, and at last we may nably hope for a solution of the most urgent of the problems have confronted the architectural profession since the tion of the Society of Architects nearly forty years ago t is, assuming, as we again hope, that the members e Society will approve of the scheme, as they will have portunity of doing, subsequent to its confirmation by the al body of the R.I.B.A.

he proposals contained in the agreement have already been adowed in the daily press, and have been the subject icism which has not always been well informed, and which ometimes suggested a readiness to prejudice the issue the material facts are known. We have been familiar he proposals for some time past, but it has not appeared desirable to refer to them until the two Councils had eted their negotiations and their proposals were before rofession. The most notable part of the agreement is roposed absorption of the Society by the R.I.B.A., and ist surely accept this as a wise and inevitable result if sh to see the profession take its right place with other sional and representative bodies in relation to the public Government. The proposal is supported by most of the s of the profession largely because of the greatly increased tance and value which will be given to the standing and of one representative society in dealing with matters ich it is desired to influence public opinion, apart from n addition to the question of Registration. Upon the aspect of the proposal the Council of the R.I.B.A. have, e advice of their Parliamentary Agents, consulted Mr. d Shortt, K.C. (late Home Secretary), and his opinion t the dissolution of the Society of Architects and the sion of its members into the R.I.B.A. would immensely then the hands of the R.I.B.A. in the promotion of a ration Bill. "Coming to Parliament," he says, "as would, for the protection of the public as well as for their better regulation, they would speak with the united and nous voice of the whole profession. I am of opinion heir chances of success would be infinitely greater than would be in present circumstances." This opinion cannot be ignored, and this conclusion and the details of the agreement can be heartily commended to the consideration and support of the electorate. The existence of two societies each nullifying the efforts of the other in an attempt to represent the profession and duplicating work which can be properly carried out only by one society acting for the welfare of its members is an anomaly which has undoubtedly had a prejudicial effect on the profession, and has had little to justify it, and it is a notable achievement of the two Councils to agree that for the good of the profession as a whole the interests of all will be best served by amalgamation, and upon such an agreement both Councils can be warmly congratulated.

In saying this we are not oblivious of the fact that this may not be the opinion of all members of the two bodies, and that some of the details of the agreement may not be acceptable to all parties. Indeed, we already know that the agreement is being opposed, but we hope the opposition will very carefully consider the position and will sooner or later agree that the acceptance of the agreement is the broad and enlightened view to take. Surely all members of the Institute must wish for agreement amongst themselves, that they may be able to leave the methods of politicians to other people, and that the Institute may be free to devote all its efforts to the promotion of architecture and the interests of architects.

From the standpoint of the individualist this may not be an ideal world in the sense that we can ensure the fulfilment of our own ideas without regard to the views of others, and it is probably a better world for that reason. That we have to make compromises before we can achieve objects in view is the experience of most of us. We have seen the formation in the Institute of two parties of able men in whose sincerity we must believe just as we believe in their desire to promote the interests of their profession and the body representing them. Both wish, we must suppose, to reach the same end, but they do not agree as to the methods.

The majority of the profession undoubtedly want Registration, and by means of the agreement we have apparently the only way of securing what we want. Can we, therefore, go back to the position we occupied before the Institute endorsed the demands of Registrationists? We believe the members of the Institute will agree that we cannot, and that they will support the agreement is our hope and belief.

Of the value of Registration we are not now speaking, but only of one clear and available means to that end. In our desire for the improvement and elevation of the professional status and the advancement of the art itself we should surely keep steadily in mind the goal at which we are aiming. Does anyone doubt that to some extent the welfare of the profession and the art is likely to be achieved by differing means? We all realise only too well that the highest achievements in art and the best pecuniary success are seldom to be found along the same pathway, and the old question of whether architecture is an art or a profession still remains. For the moment we are not discussing that question, and we can only hope that the move now being made will prove as beneficial to the profession as the promoters of Registration desire and more beneficial to the art of architecture than its opponents have feared.

NOTES.

How Not to Get Houses.

POLITICS have much to answer for, and we are sure Sir Ernest Benn is right when he blames the political fog for obscuring the housing problem. He believes Mr. Lambert (to whose letter we referred last week) to be entirely right in attributing the present anomalous position to the attempted use of politicians instead of builders as a source of supply for houses. Very emphatic and telling is the way in which Sir Ernest puts the matter. He says the next generation will understand that the way to get houses is to say "We don't want a house. Take it away, it is too dear, we can do better next door." The result will be as it always has been in every market in every age—we shall get an ever-increasing supply of what we want. The present position is destroying potential houses at the rate of hundreds a week. This will continue to an increasing degree so long as we think that houses can be built with votes. It is worth quoting a paragraph from Sir Ernest Benn's letter to the *Times* on Tuesday: "Can anyone deny that if the housing market had been as free as the market in books or newspapers, if the Statute Book had not been encumbered with the 390 Acts of Parliament which provide for the housing of the working-classes, if the enterprise which has been devoted to the making of books and newspapers had been turned on to houses, we would now be embarrassed with the choice of three parlours in which to sit, and a different size of bath for every size of baby?"

Payment by Results.

WHAT we have already emphasised is borne out by the pertinent question of Mr. E. D. Simon from the House of Commons, viz.: "Is the Government prepared to accept and to subsidise out of public funds for fifteen years a scheme based on about half the output per year that can be reasonably expected?" The estimate of the report of the National House Building Committee in the proposed housing scheme works out at less than three hundred bricks per day. Should a payment by results not be insisted on in return for subsidies which are to be given?

Northern Polytechnic Institute.

AN instance of the more humanistic influences penetrating the teaching of craftsmanship is seen in the very excellent examples shown at the Building Exhibition at the stand devoted to the work of pupils of this Institute. How directly good results may be reached where the pupil is left with freedom enough for his own aptitudes to find expression is noticeable in the carved stonework, of which there are various good examples. G. Rainbird (aged 16), one of the students, shows a small headstone which might serve as a model of what is desirable, being entirely delightful both in design and treat while there is the right feeling of and simplicity that befits its pur What a difference could our ceme be furnished with tombstones of no becoming character! Other examp incised lettering on stone are of character and reflect much credit o conduct of the Institute. The ten now becoming general for the sc and institutes to promote this feeling in craftsmanship is of good a for the future, for the truest craftsma is generally found to accompany th feeling for design and they grow o each other. The particular headsto which we refer has a shaped he agreeable proportions with a small w at its centre in relief and the inscri panel raised from the ground.

Architecture Club Lectures.

PERHAPS another yea Architecture Club will more encouragement t tors to their exhibiti attend the lectures arr in connection with it, and in so doin more encouragement to their lecturer Except for an inconspicuous list s into the catalogue there seeme announcement of time or subject lectures, and not until a hardy pion two had penetrated the tenebrous s of the lecture room were others indu enter. A notice at the entrance cerning the lectures would not viol dignity of Grosvenor House, and doubtless affect the numbers attend

lisfiguring advertisements. We that every one of these firms will nise that it is not good business to ronise the public, and that those in ol of the exhibition will take a much d lesson to heart.

---

portion Public ussion.

The subject of the London Bridges and the City Churches—of so much general interest—has led to much public discussion, but otice a tendency to defeat its own , that of reaching a right decision, the exponents of different views have en taken no pains to understand other a little better before rushing rint. Architects, speaking with a d voice and divulging the want of on ground between them, weaken ect of what is said—the influence of own counsels—through want of ient among themselves. A further om which is not, we think, to the tage of public discussion is the statement which accompanies op- points of view. When we are told hasise an argument that Waterloo is the finest bridge in the world, n in defence of City Churches we heir merit—which really needs no pecial pleading—far beyond what reasonably granted about them, aken the cause we have at heart. rightly asserting the historical and ctural worth of the City Churches, ht not to forget that, though so f their kind—it would be sheer ism to remove any of them—they ttle yet of such quality as attaches iæval ecclesiastical building. As- n had developed into a prose of ois security and convention which no such measure of beauty to the spirit as the freedom of earlier bestowed. And so with John 's fine bridge, somewhat "dour" unconciliating bluntness, hardly l by lightness or romance, which this same later, more Puritan,

Sir John Soane.

An admirable monograph of "The Works of Sir John Soane" has just been issued, and should form a very just and fair epitome of the distinguished architect's work. If his work did not afford any great impetus to the development of modern design, we can at least find a lesson of encouragement in his whole-hearted devotion to his profession, and a definite promotion of the study of refinement in architectural productions. No one has more thoroughly assimilated the knowledge of the man and his work than Mr. Arthur T. Bolton, who has produced this interesting and well-produced monograph, the result of the Soane Museum publications, and at the very moderate price of six shillings and sixpence.

Hanging Committees.

The suggestion put forward by Mr. Hesketh Hubbard that there is room for improvement in the methods and choice of hanging committees, who being composed entirely of artists tend to narrow the choice to a rather restricted professional view, has much to be said for it. A certain kind of technical facility, often not at all the best—a facility that is often not faculty—may obscure the presence of other qualities in the minds of such committees, so that their action may encourage a somewhat low average rather than the best. The writer suggests that it would give more breadth to their decisions if such committees included those who were not artists, men of outside acquaintance with art, perhaps the connoisseur and the art critic; an influence more detached in its approach, to obviate the prejudices so often haunting the professional artist. Perhaps there would be fewer pictures painted—we hear of 10,000 being sent to the R.A.—if encouragement were not so much shown to a certain order of technical skill fostered through the schools, but of inferior rank as art. We think the suggestion for an infusion of new blood would lead to results beneficial to exhibitions and correct the rather contracted professional standard which encourages over production, and is a direct cause of the enormous quantity of pictures of no particular inwardness beyond a certain kind of technical assurance which it fosters. If committees were enlarged to include those who were not artists, the man of taste, &c., a new complexion would soon be manifest in the arts.

British Empire Exhibition Honours.

Those who have had an opportunity of seeing the lay-out of the British Empire Exhibition at Wembley, and the buildings which have sprung up on the site with such rapidity, will welcome the honour of Knighthood which the King has been pleased to confer on Mr. John W. Simpson, PP.R.I.B.A., who (with Mr. Maxwell Ayrton, F.R.I.B.A.) has acted as architect, and Mr. E. O. Williams, the engineer, as two of the most deserving honours announced for some time. Sir John Simpson and Sir Evan Williams are to be congratulated on having successfully carried out what is undoubtedly the biggest building scheme the world has ever seen, not only in an extraordinarily short space of time for a work of such magnitude, but in a material—reinforced concrete—which has not been previously used for such monumental buildings.

Panel on Old Chest at Coyty Church, Glam.

GENERAL NEWS

Professional Announcement.

Mr. Wilfrid L. Evershed, chartered quantity surveyor, has taken offices at 19, Buckingham-street, Adelphi, London, W.C.2.

Mr. Kenneth Glover, M.S.A., will be pleased to receive copies of catalogues and prices at 11, Saville Chambers, North-street, Newcastle-upon-Tyne.

Schools at North Heaton.

The Education Committee, subject to the necessary sanctions being obtained, has invited Mr. H. T. Wright, F.R.I.B.A., to accept the post of architect for the proposed secondary schools at Heaton.

Town-Planning Schemes.

This pamphlet* is badly needed. It includes a brief description of the general objects, scope, and contents of town-planning schemes under the Town-Planning Acts, 1909 to 1923, and of the procedure to be followed in preparing them. To define the ground covered we cannot do better than quote from the introduction :—"The preparation of a Town-Planning Scheme does not imply as is sometimes supposed an intention to cover the whole of the land in question with buildings, or to make a somewhat elaborate housing scheme, nor does it necessarily involve the local authority in immediate expenditure on works of any kind. Its object is to provide that development, if and when it takes place, shall be in accordance with a plan which has been prepared in the interests of the community as a whole, industrial and commercial as well as residential, land owners as well as tenants, and thus help to secure for the future, so far as reasonable foresight can do so, the welfare and prosperity of the district and its inhabitants. The plan should fix, in broad outline, the areas to be used for industry, business and residence, the principal roads and open spaces, the number of buildings to the acre, and similar matters."

Due stress is laid upon the importance of securing the good will of all the affected interests at the outset, and architectural and archæological societies are not overlooked. Town planning is so little understood and is so often confused with housing, building, and with other definite works that we hope this lucid and excellent pamphlet will be widely circulated.

Applied and Fine Arts Competition.

In the House of Commons last week, in answer to Mr. Birkett, who asked whether he would consider revivıng the national competition open to all the art schools in the country for applied and fine arts, which was suspended in 1916 as a measure of economy, Mr. Trevelyan, President of the Board of Education, said the form and scope of the national competition were under consideration before the war, and he was quite willing to review the matter in the light of present-day conditions.

Building Prices.

In its report for March the inter-departmental Committee of the Ministry of Health states since February an advance of 2s. per thousand in the price of bricks is reported from Willesden, and an advance of 5s. per thousand from Leeds, so that taking into account the increases referred to in the chairman's report for the month of February, advances in the price of bricks have been notified since January of this year from seven out of the twelve centres selected by the Committee.

There has been a further sharp rise in the price of lead, and sheet lead, for example, now stands at a figure, based on the average of the returns received, of approximately £48 per ton as against £36 in April, 1923.

COMPETITION NEWS

Holmside and South Moor Hospital.

The awards in connection with the architectural competition held by the welfare organisation of the Craghead and Holmside, and the South Moor Collieries, for designs for the erection of a cottage hospital between South Moor and Craghead, have now been made by Mr. T. R. Milburn, of Sunderland (who was appointed by the R.I.B.A. as assessor), and are :—

1.—(£75), Messrs. H. T. Buckland and Wm. Haywood, Birmingham.

2.—(£50), Messrs. Shannon & Son, Malton, Yorks.

3.—(£25), Graham R. Dawbarn, London.

The first premium carries with it the appointment as architects for the building, the estimated cost of which is £12,500. In all 77 designs were submitted.

The design placed first is given in this issue, and a review of the designs submitted appears on p. 669.

Monument to the Missing, La Ferte.

The assessor Sir Aston Webb, has given his award in this, the first competition organised by the Imperial War Graves Commission, to the design by Major G. Hartley Goldsmith, M.C., A.R.I.B.A.

Essays on Concrete in Agriculture.

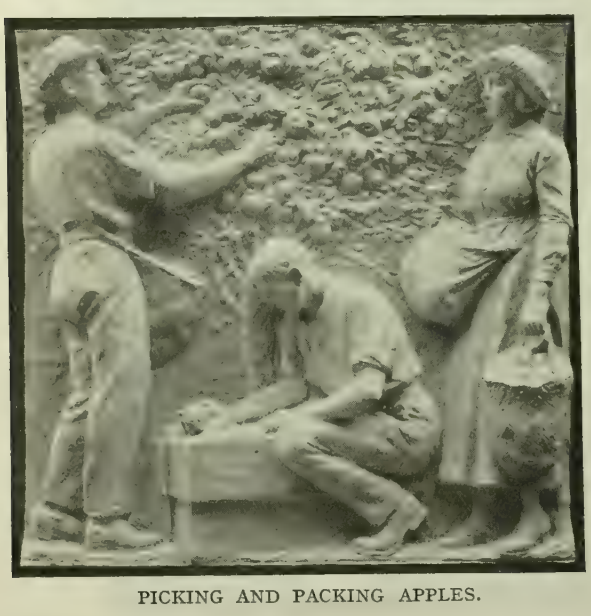
The following awards have been made by Concrete Utilities Bureau, in this competition

Competition A (Students of Agricultural Technical Schools).—1st prize, £20 : David Adam, Ladesford, Forfar, Scotland. 2nd, Alfred John Carter, Frost Barn Cottage, leigh. 3rd, £5 : Eric Arthur Poulter, 50, Ac road, Bishops Stortford. Hon. Mentions, each : Alexander Calder, St. Mathew D Aberdeen ; Jas. Wm. Pestings, 164, Wednesf road, Wolverhampton ; John F. Wanhill, Grosvenor-road, Muswell Hill, N.10 ; A Dowrick, Higher Town, Truro ; Wm. S. Ro Queen's College, Cambridge.

Competition B (for all other than Studen Agricultural or Technical Schools).—1st £20 : John Sanders Bray, F.S.I., 18, C dral-yard, Exeter. 2nd, £10 : Alex. A. Will son, 55, St. Swithin-street, Aberdeen. 3rd, Capt. Wm. J. Pulford, Dorrington, Salop. Mentions, £1 each : Frank Hewitt, F Council Offices, Kiveton Park, near Sheff L. J. Pond, 5, Draper-avenue, Eccleston, Chorley, Lancs ; P. E. Wilson, 30, Mad road, Ealing, W.5 ; D. N. Hardy, 49, Grosv road, West Kensington, W.14 ; Edward away, The Orchards, Chalfont St. Peter's, B

Bridgeton, Glasgow.

The Corporation propose to offer premiums, amounting in all to £375, t architects whose designs are placed first, se third and fourth in connection with the ere of halls at Bridgeton. Mr. James Loch Hamilton, President of the Glasgow Institu Architects, will act as assessor and adjudica the designs. The estimated cost of the buil must not be in excess of £25,000.



Other Competitions.

Other competitions still open include following (the dates given are, first the se in date, and second the issue of *The Buil* which full particulars were given) :—Indu Designs (June ; Dec. 21, 1923). Ross Memorial (Sept. 30 : Feb. 1). Glasgow Hall (July 4 ; April 11).

SOUTH MOOR COTTAGE HOSPITAL COMPETITION

A CRITICISM BY AN ARCHITECT

uth Moor is a long, straggling street of rs' dwellings a Co-operative Store, Post e, a large block of buildings consisting of ry offices and manager's house, and an tectural monstrosity called a miners' hall. a village, typical of hundreds of others, ed in a most un-get-at-able spot in the of the Durham coalfields. One has only there by road, on the ubiquitous motor- to realise the necessity for a hospital more sible than the Royal Victoria Infirmary, astle-upon-Tyne.

elieve I started out in fairly good health, y the time I arrived at South Moor the of Durham's A1 roads and no less A1 was distinctly noticeable. What it must e to a wounded man, or an ailing woman, notor ambulance on these A1 roads for two l hours one "trembles to think." On l I found the miners' hall locked up, and istodian, a very obliging man, away to , and no one seemed to know where he Having come so far, however, and led in such comfort, I was not in the mood hampered by any small obstacles, so I d in through a window, much to the ment of a crowd of small urchins, and the ation of the worthy custodian when he ally arrived.

ntering the miners' hall, where the draw- ere more or less on view, one's first impres- as of the immense waste of labour which ne to the making of this perfect sea of gs. There must have been 500 drawings t, for a job estimated to cost £12,500. pression created in the public mind by ibition of this kind must be one of utter rment, that some 70 members of an able profession are willing to waste both d money in a contest of skill, where the ration for the majority is nil, and for the a sum which will barely cover his standing and expenses. No wonder the public understand what an architect stands for, preciate the amount of money and years that go to making him what he is.

n as a whole, the standard of excellence lesigns submitted in this competition is he average, and there is very little that or of particular interest to those who ade a special study of hospital planning. by Messrs. H. T. Buckland & Haywood, ingham, owe their success in no small to a really beautifully drawn and l perspective view, covered all over with ts in varying colours, which must be a to the uninitiated. The architecture onts is disguised and the good grouping is sed in this drawing with consummate t is quite the best drawing in the room. ve a simple, straightforward plan, andi lding is well placed on the site as regards The wards are not disconnected from inistrative block, and they have solid th no ventilation under them—a some- astic departure from hospital practice. nd w.c.'s have no aerial cut-off from nd no duty rooms adjoin the wards. bedrooms are on first floor and access rom men's side and without supervision practice. The kitchen, 20 by 15, is big, and store and larder are inade- A laundry 19 by 10, and no washhouse ng room seems also inadequate.

evations are poor and suffer by com- with the design placed second; the e of 210,112 is priced at 1s., at which is very doubtful if this scheme could l out.

by Messrs. Channon & Son, of Malton, very similar in plan to the first, but ms are better placed. No cut-offs for c.'s and sink rooms. The architecture etter than the first, but the perspec- hardly does justice to it. The eleva- beautifully drawn, and very ably designed. Again, solid floors to wards and no ventilation. Total cube 186,842, priced at 1s. 3½d. It is difficult to see what has prevented this scheme being placed first.

No. 39, by Mr. G. R. Dawbarn, London, is a very able and well-grouped cottage hospital plan, surrounding a forecourt on the north. Operating, anæsthetic, X-ray and surgery are not so well-grouped and arranged as in the first two plans. The wards are a bit narrow at 22 ft, and 100 ft. super per bed is on the small side. The design is architecturally poor, and the perspective view quite inadequate. Priced mainly at 1s. 6d.

To come now to the "also ran." There are very many, and I have selected only a few which specially appealed to me. By the way, designs 1, 2 and 3 are, curiously enough, mounted neatly on strainers, while a great many are mounted on any old thing, or not mounted at all. It is sometimes important that an assessor should see one's drawings, and anything that will assist him in doing so is desirable. Another thing: one would have thought that the total cubic contents of a design might also be of interest to an assessor, yet, even in the winning design he has had to do an addition sum before he could arrive at it; and in many others I defy him to arrive at it at all, notably in Messrs. Brierley & Rutherford's scheme. If one is satisfied with the lowness of one's cube, one should have no mock modesty about stating it clearly.

No. 52, by Mr. W. N. Scaife, Newcastle-upon-Tyne. This is a fairly simple and straightforward scheme, a bit lacking in unbroken frontage lines. Bath, sink room and w.c. very well arranged, but not cut off as they should be. Duty rooms properly placed, nurses' block the best in the room, operating room, surgery, anæsthetic and X-ray rooms not well grouped. If this author will only appreciate the value of unbroken frontage lines, and, above all, simplicity of plan, the most difficult thing of all to attain, he will go far in competitive work. Mr. Scaife's architectural treatment is distinctly good, but lacking in simplicity and breadth of vision. His grouping is excellent. Total cube satisfactory; priced at 1s. 2d. This design was commended by the assessor.

No. 9, by Mr. George Hollins, of Newcastle, Staffs. This competitor has the distinction of being about the only one in the room to make any attempt to isolate his ward blocks from the administrative buildings. This I consider a serious defect in all three of the selected designs.

No. 51, by Mr. M. Wilson, of Stanley, Durham. All honour is due to Mr. Wilson for his work n this competition. His plan is excellent in many respects, and he has scored where the winners have failed. His sanitary annexes are cut off, wards well-arranged and of adequate size, kitchens cut off, as they should be. Architecturally he fails, and he should study simplicity of plan. He scores on his cube, 170,000 ft., priced partly at 1s. 6d. and partly at 1s. The rendering of his drawings has not helped his chances.

No. 71, by Messrs. Brierley & Rutherford, York. Simplicity of plan and unbroken outline are looked for in vain in this scheme, which is a little disappointing from such a source. The elevations are treated with quiet restraint, and the roofs are very obviously covered with pantiles. The plan is disappointing; the perspective does not help matters.

No. 73, by Mr. T. W. Sharpe, Dewsbury. This is a very fine scheme indeed, and it is difficult to see why it has been overlooked. The departmental planning is excellent. The kitchen and laundry blocks have been most carefully thought out, for the work to be done in them. Architecturally it is just what it should be, a cottage hospital. The perspective view is perhaps a bit too gorgeous, but when one had got over the shock of the brilliant landscape, and its more than brilliant rendering, it does show a well-designed hospital. So far as one can make out from the somewhat involved statement of cubic contents, they are all right, and I should have had great difficulty myself in getting past this scheme, on which the author is to be congratulated.

No. 7, by Messrs. Hays & Gray, of Durham. Rightly commended. Elevations infinitely superior to design placed first, and plan very able indeed. Cube rather high at 212,160.

No. 50, by Mr. J. A. Minty, London. Plan somewhat over-departmentalised. Too broken-up and unconvincing.

ARCHITECTURAL ACOUSTICS

Mr. S. A. Hurren recently lectured at the Northern Polytechnic Institute on this subject. In the course of his remarks he said the most helpful method of gaining an insight into the science of acoustics was to visualise phenomena, and endeavour to understand the actual physical movements of the air during the propagation of fongitudinal sound-waves. To that end they must know something of the kinetic theory of gases, something perhaps that would be difficult to realise, but well worth the trial.

Taking the diaphragm of a gramophone sound box as a familiar vibrator, let them consider what happened when it moved inwards just once. The molecules of air lying immediately against the diaphragm were momentarily crowded together, or condensed. Now they were aware if someone in a crowded lift pushed them from behind, they unavoidably pushed the person in front of them. He, in his turn, pushed the man in front of him, and so on, right across the lift. This was exactly what happened to the air particles. The "push" was passed on, or in other words, energy was transferred. By the time that the initial "push" had travelled four feet, a diaphragm sounding "Middle C" must send out another one, and go on sending them out at regular intervals. By the end of one second it would have sent out 261 of these shocks, the first of which would have travelled 1,100 ft.

In the wireless broadcasting studio at Medford Hillside, the walls and ceiling had been covered with a half-inch layer of camel-hair padding, to give the lines of sound no chance of being strongly reflected. At Savoy Hill the studio had a thick green carpet, and the walls and ceiling were loosely draped with curtains. Beneath the curtains there are six layers of felt, set an inch apart on light framework. Nearly four tons of it were used in this way, reducing reverberation to a minimum. The result was a little disappointing to a singer, who felt that his voice had lost some of its power, but excess of reverberation would be far more distressing. The best materials for absorbing sound-waves, instead of reflecting them, such as felt, cork-dust or Cabot's quilting, were absorbent by reason of myriads of little air-pockets.

The late Wallace Clement Sabine of Harvard University made most thorough researches into the subject of reverberation, and came to the conclusion that quantitative measurement of the co-efficient of absorbency of all the materials presented in an auditorium rendered necessary the use of a standard unit of absorbency. A square metre of open-window space was chosen for the purpose. For experimental purposes Sabine used at first a Gemshorn organ pipe (C512), sounding it until the hall was full of tone, then suddenly cutting it off. The subsequent period during which the residual sound remained audible was measured by aid of the human ear and a delicate chronometer. The intensity of sound produced in the hall by the particular pipe employed was calculated to be a million times that of minimum audibility. From hundreds of prolonged and tedious experiments, Sabine found definite values for the co-efficient of absorbency of all common materials including the furnishings and the audience.

CORRESPONDENCE.

The North Transept of Westminster Abbey.

SIR,—Professor Lethaby, in his article, "Westminster Abbey Re-examined," in your issue of March 7, refers to my paper published in the R.I.B.A. Journal of December 18, 1920.

I had hoped that he would on its publication have reviewed the conclusions arrived at in 1906, published in his interesting work, "Westminster Abbey and its Craftsmen." In this he condemns, in good round terms, the late John L. Pearson's restoration of the façade of the north transept on the grounds that it was not in accordance with the original design.

In 1882, as a candidate for the R.I.B.A. examination, I made a special study of the Abbey, and since then have taken a keen interest in everything relating to it. I had told my students in New Zealand that by means of study of old prints, documents, and careful examination of original stones, the restorers had given to us, as far as was possible, the beauty with which Henry III and his artificers had originally endowed it.

It came, therefore, as a shock when reading Professor Lethaby's book on arriving in England in 1920 to find that he held diametrically opposite views. A fresh review of available evidence suggested itself.

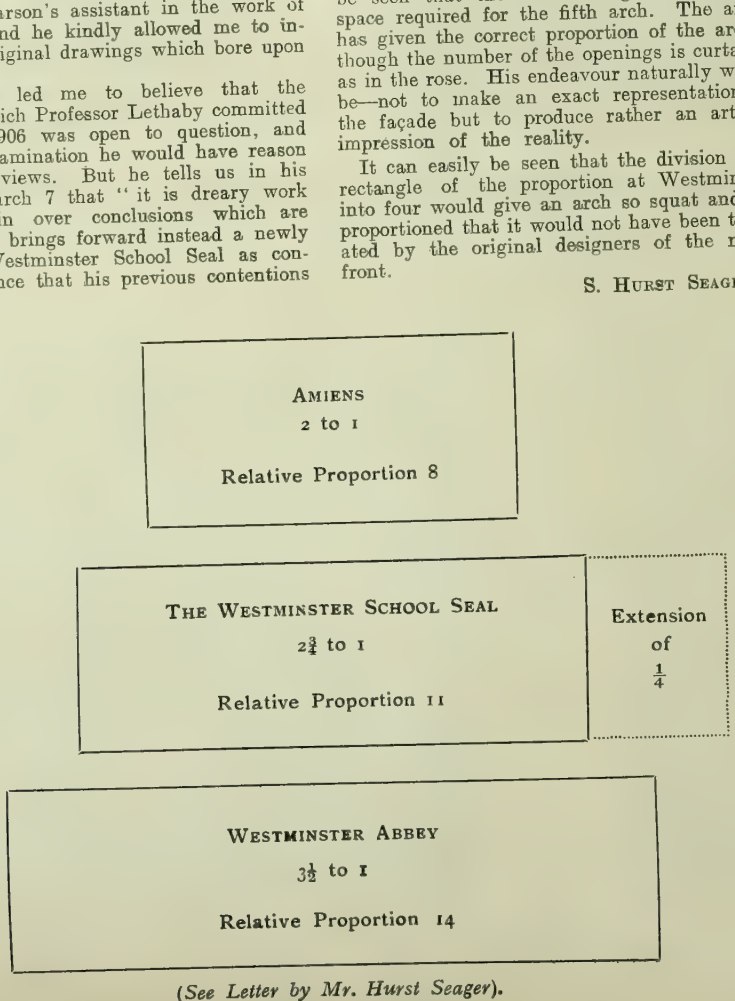
All the prints in the British Museum, the Guildhall, and R.I.B.A. Library, together with the Batsford and other collections, were examined, and a large number—I think 21—photographed and deposited in the R.I.B.A. Library for reference. Evidence remaining in the building was examined, and the result published in the Journal with a selection of the essential prints. Throughout the investigations I had the great advantage of consultation with Mr. A. D. Sharp, who had been Mr. Pearson's assistant in the work of restoration, and he kindly allowed me to inspect those original drawings which bore upon the subject.

The result led me to believe that the opinion to which Professor Lethaby committed himself in 1906 was open to question, and that on re-examination he would have reason to alter his views. But he tells us in his article of March 7 that "it is dreary work arguing again over conclusions which are denied," and brings forward instead a newly discovered Westminster School Seal as conclusive evidence that his previous contentions are right.

The seal is of such great interest that I hope you will publish an impress of it. But can it be regarded as reliable evidence as to the exact form of the original work? I think not; and Professor Lethaby himself thinks not when he considers the representation in it of the rose window. In reference to that he says, "Because of the small scale only about half of the number of the divisions were given in the tracery." Should we not, therefore, be justified in assuming that for the same reason only four arches are shown in the arcade under the rose window instead of five? This may or may not be, but it certainly cannot be claimed that the seal which is shown to be absolutely wrong in one particular is absolutely right in another.

Everyone will, of course, admit Professor Lethaby's contention that the north front of Westminster was based on the west front of Amiens, and corresponds with it in many parts. It was never a copy of it: the proportions of it are quite different.

I have no notes or references with me, but I hope that on my return to England you will permit me to lay before your readers the evidence gathered.



In the meantime I would point out that the proportion of the rectangle in which the arcading is placed at Amiens is 2 to 1, the width being twice the height; consequently each of the four arches that it contains has a height of double the width—a pleasing proportion.

The proportion of the rectangle at Westminster is $3\frac{1}{2}$ to 1. The proportion on the seal is $2\frac{3}{4}$ to 1. The relative proportions thus being Amiens 8, the seal 11, Westminster Abbey 14. This extra height on the seal in relation to the width allows four arches to be represented in a more pleasing form than would be the case if the rectangle were shown correctly.

If the rectangle of the seal is extended so that the width is $3\frac{1}{2}$ times the height it will be seen that the extension gives the exact space required for the fifth arch. The artist has given the correct proportion of the arches though the number of the openings is curtailed as in the rose. His endeavour naturally would be—not to make an exact representation of the façade but to produce rather an artistic impression of the reality.

It can easily be seen that the division of a rectangle of the proportion at Westminster into four would give an arch so squat and ill-proportioned that it would not have been tolerated by the original designers of the north front.

(See Letter by Mr. Hurst Seager).

The Institute and the Society.

SIR,—The particulars which appeared the newspapers recently did not emanate f the Society or from anyone connected wit You appear to have got hold of the wrong of the stick on a question of procedure v you state that, if the proposals are finally pa by the Society, they will then be put before general body of the R.I.B.A. The agreed cedure is exactly the opposite, and if the posals are approved and ratified by the ge body of the R.I.B.A. they will then be prese to the general body of the Society for consi tion.

C. MCARTHUR BUTLER,
Secretary of the Socie

[**Mr. Butler is, of course, correct, bu were not aware of all the facts when we to press.—ED.]

Thames Bridges.

SIR,—Southwark Bridge, it has repeatedly remarked, is very little used has no adequate northern approach—Q street, which starts from the bridge, termi in Cheapside; and King-street, which cont on, is too narrow to be of use.

If a road were constructed, commenci the south end of Moorgate and terminati Cheapside, opposite to the northern en Queen-street, it would divert a good deal Moorgate traffic from the congested Pr street, King William-street, London route, on to Southwark Bridge. London and its approach roads would be relieve the suggested widening of Princes-street not be necessary.

Some of the Bridge House Estate might, apparently, be more reasonably exp on the suggested road, as it is practicall of the completion of the bridge, rather on the St. Paul's scheme which so many co would be worse than useless.

W. J. H. LEVER

Bradford Masonic Hall Competition.

SIR,—I am not aware how other comp feel over the matter, but just before away on holiday I received a printed notifi to the effect that the above matter has suddenly withdrawn from public competi

Considering the fact that I have already several weeks in working out a satisfactor and elevations on a somewhat cramped difficult site, as I have no doubt others al done, it comes somewhat as a shock to fi all one's energy and time is to be was this manner, and implies a very unreas proceeding on the part of the promoters.

Under the circumstances it seems to m the least they could do would be to grant honorarium of, say, two guineas, to ea *fide* competitor by way of compensation some satisfactory explanation is forth after issuing the invitation to compete. writing them to this effect and only h architectural societies will do something an end to this kind of thing.

ELFRIC H. S

Restoration of Ruins.

SIR,—The last four lines of the stan lished in your last issue, should read :—

"Handle with reverence EACH crumblin
Respect the very lichens o'er it grow
And bid each ancient monument to
Supported E'EN as with a filial hand

C. C. THOMPSON, F.

Future of Clopton Bridge.

Mr. Gosling, Minister of Transport, sented to receive a deputation from t ford-on-Avon Borough Council on the of the proposed widening of the histori Bridge. The matter has given rise t deal of public controversy. The int fixed for Tuesday, the 29th inst. The representatives will be supported by th Surveyor and other officials of the War County Council who favour the schem Borough Council.

QASR-EL-AINI HOSPITAL AND SCHOOL

AN ARCHITECT CONTRIBUTOR.

e problem set before the competitors was means a simple one. Not only is the t of the Hospital unusually large (1,270 with a daily attendance of 3,000 out-nts), but the special conditions, climatic social, differentiate the planning from ean methods in a marked degree. "On nt of the powerful sun which compels losing of the window openings exposed ect rays by louvred shutters during the me, a northern aspect is the most de-e for living, sleeping and working rooms. rn rooms will be darkened by the closed rs in the morning, and western rooms the afternoon, unless protected by las." ("Note on local conditions," supplied to competitors.)

regards local customs, the rigid separa-f the sexes is the dominating factor in heme. No communication for the public patients is permitted between the two ns; while inasmuch as certain important ments (*e.g.*, operation suites and out-t department) must be used in common th sexes, it will be seen that the diffi-are very considerable.

conditions are very clearly drawn up lly detailed, and the information supplied xhaustive as it well could be.

elve sets of designs were sent in, of which re exhibited at Conduit-street, the re-ng three being by French architects.

site is the northern end of Roda Island; n shape is roughly triangular. It is d into two parts by the Avenue de Roda, crosses from east to west for about irds of the width, then turns south; a portion of the larger part of the site s below the remainder southward. The the site forms an isolated piece of land nded on all four sides by roads.

winning design, by Messrs. C. Nicholas Dixon-Spain, shows the whole of the blocks arranged on the west side, with rridor of approach for both the male and n wards. The main entrance to the hos-s on the east, and to get this a large of ground has been sacrificed to form a urved approach, with a roadway extend-the north to give access to the nurses' sters' homes. The ward blocks are de-apparently with a view to avoid gular rooms; the sanitary offices are in a projecting tower on one side of the but neither in the centre nor at the e end, and for some reason not apparent rd units are not aligned, the result being e block partly obstructs the current of tween the two units. The operation are planned in curiously complicated of four blocks, two of which are set at le to the other two. The reason for this apparent, and the result inconvenient.

design placed second, by Messrs. Lan-, Rickards, Lucas and Lodge, shows rd units placed on the east and west with the corridors for access to the nits roughly parallel to the river banks closing a triangular space in which are the operation theatre suites, the central and stores, the administrative offices, resident and home officers' quarters. ut-patient department occupies the part of the projecting part of the site west side, and the isolated site is given o the recreation ground and the 's house. The plan is symmetrical ll thought out.

n No. 10, by Messrs. Percy Adams and —A well devised plan, with the wards n the east and west sides, and with ajor axes not quite so definitely east t as those in the design placed second. in entrance is in the Avenue de Roda, e reception and casualty department. administrative offices balancing one and the out-patient closely adjoining. ter is a compact, well-arranged unit; planning of the anthelmintic depart-the upper floor is not altogether satis-factory. The ward blocks are well planned, and the whole design shows a grasp of the subject and a knowledge of hospital planning.

Design No. 7, by Messrs. H. V. Ashley and Winton Newman, is, as regards the wards, planned very much on the lines of the last two designs, with the difference that the corridors giving access to the ward units are parallel instead of following the lines of the river banks. The effect of this is rather to curtail the space in the centre. The weak part of the design is the planning of the out-patient department, which is bent into the form, roughly, of an **L**. The reason of this seems to be the provision of an open courtyard between the blocks—a quite unnecessary and undesirable arrangement which increases the total length of the block by something like 100 ft. One result is that several of the blocks are lighted from the east and west. The medical school is placed on the south side of the Avenue de Roda, facing the main entrance to the hospital; and the students' hostel is placed at the south, with the sports ground intervening. On the east side of the isolated part of the site is the Director's house.

Design No. 11, by Messrs. Cackett and Burns Dick.—A well-arranged scheme, illustrated by a remarkably fine set of drawings. The wards are placed along each river front in a similar way to those in Messrs. Lanchester, Rickards, Lucas and Lodge's design, the male section being on the west and the hareem on the east. The sisters' and nurses' homes are at the north end of the Island, a position adopted by several of the competitors, and which seems, for many reasons, the most appropriate one. In the out-patient department the waiting courtyards for patients seem unduly curtailed by the authelmintic department, and the sanitary offices attached to the latter would have been better distributed in groups, so as to be easier of access.

Design No. 6, Mr. Vincent Harris.—In this plan the wards are planned on each side of a central double corridor, with dividing wall. This corridor runs approximately north and south, and the wards have their longer axis east and west. The ward blocks leave much to be desired in the way of planning; the interposition of the escape staircase and the sanitary offices between the ward and the veranda is a mistake, and the ward offices at the entrance end of the unit are not conveniently arranged.

Design No. 8, Messrs. W. & T. R. Milburn.—The general lay-out of this design is very different from any other. The wards are arranged in groups of two units united by a central block of ward offices; all wards run within a little of east and west. Near the apex of the site is a triangular building containing the sisters' and nurses' homes, with a large central courtyard. To the south of this are two ward blocks, each arranged as described above, and containing the whole of the hareem division of wards, with the infant welfare, extern work and nurses' lecture rooms on the ground floor. To the south of these are three separate blocks; in the centre the central pharmacy; to the east the central kitchens, dining rooms and steward's stores; and to the west the operation theatres block. South of these are four groups of wards containing the male units, two being on the east and two on the west, with the mosque occupying a central position. South of these are again three blocks; in the centre clinical instruction, to the east pathology, and to the west administration. On the same central axis, but on the south side of the Avenue de Roda, is the medical school. It will be seen that the whole of the buildings referred to above form an absolute symmetrical group. The outpatient department is entirely different from any other plan, being arranged round four sides of a large open courtyard. The object of thus planning this department is difficult to follow. The lighting on two of the sides must obviously be from the east and west, whereas all rooms should be lighted from the north, and the plan loses much in the matter of compactness as compared, for example, with that by Messrs. Percy Adams & Holden. With this exception, the scheme is well conceived and is attractive.

Design No. 5, Messrs. W. A. Pite, Son & Fairweather.—Here again we have a perfectly symmetrical plan, with ward units running east and west, the male section being to the east, the hareem to the west, and the centre space occupied by (from south to north) the reception and casualty block, main power station, steward and storekeeper and operation theatres. The main entrance is in the Avenue de Roda, on the central axis between the ward blocks. To the east of the entrance is the mortuary, with entrance from the Avenue de Roda, with the administration offices behind. On the west side, entered from outside, are the extern and infant welfare departments, and behind these the houses for sisters, nurses and probationers. The Director's house, medical school, the two blocks of isolation wards and the mosque (at the extreme north of the island) complete the buildings on this part of the site. The arrangement described above necessitated putting the out-patient department in the isolated part of the site to the south of the Avenue de Roda, and here comes in a grave question. In the "Notice to Competitors" in the Second (Final) stage of Competition the following words occur: "Any of the following sections of the hospital might be placed, at the discretion of the competitors, on the portion of the site to the south of the Avenue de Roda:—Division A (m), medical school; Division D, students' club and hostel; Division E, Director's house."

To direct that certain specific sections may be placed on a clearly defined part of the site must surely be taken to imply that no other sections are to be placed there. If this is so, and it is difficult to see any other meaning in the clause, the authors of this design have put themselves out of court by placing the out-patient department where it is clearly not meant to go. Apart from whether it was open to competitors to disregard the clause cited above, it must be conceded that the plan adopted by the authors of the design has many and obvious advantages, and that the objections that can be raised are of relatively minor importance. The fact, however, remains that apparently all the other competitors felt themselves bound by the limitation and planned accordingly. It is much to be regretted that competitors were not left a free hand in the matter. If this had been done there could have been no reason for refusing to this remarkably able plan the place to which it is justly entitled.

Design No. 4.—It is difficult to say anything in favour of this scheme, and criticism is rendered more difficult by the absence of a block plan. The wards are planned in the form of an **X** which has had its arms squeezed together, a form of which nothing can be said in its favour.

It will be noted that no detailed criticism has been made in the foregoing of the administrative offices or the medical school buildings; this has been done intentionally, first, because to deal exhaustively with these matters would have required many times the space available; and, secondly, because the scope for variation in these departments is not large, and, with possibly one or two exceptions, the various buildings referred to are planned with remarkable skill by all competitors. As regards architecture, only one of the designs shows no attempt at assimilating any distinctly Egyptian features. Messrs. Adams & Holden's design is the only one which is very distinctly Egyptian, and judging from the fine detail elevation shown it would have been a very striking building. Most of the other designs show a distinct Greek feeling; but simplicity seems to be the keynote of all, and the frequent occurrence of open colonnades gives ample opportunity for the play of light and shade.

[The first and second premiated designs in this competition, and designs No. 10, 7, 5, were given in *The Builder*, March 16—April 6, 1923.]

TENDERS AND VARIATIONS IN THE RATES OF WAGES

WE have received from Mr. Max Clarke, F.R.I.B.A., the following communication:—

For some considerable time there has been "talk" amongst those who have to do with building, to the effect that the men engaged in the various trades wanted a rise of 2d. per hour; whether this applies to both skilled and unskilled labour, or whether it is suggested as an all-round increase on the present rates, I do not know, nor is it material to this note, but it is in the air, it is being pressed for, and some negotiations have taken place. An offer has been made by the employers and declined by the operatives, and so the matter stands. At the time I write all building work is faced with an increased cost, and just at the time when cheaper houses and more of them, with labour-saving appliances, better built, and fit for heroes, are on the lips of those who want a "cry."

All this being so, the individual who stands between the employer and the workmen, to wit, the contractor, fears that he may suffer if he enters into a firm contract and the long-talked-of rise of wages becomes an agreed fact before the completion of his contract, and, like a wise person, he desires to transfer his responsibility on to the shoulders of the employer. The latter, poor man, knowing nothing about the matter one way or another, is rather surprised if he wants to build a house, or anything else, that he cannot, according to the proposed régime, get a fixed price for what he wants, but things being as they are he is either content to pay, or makes up his mind to go without, what is perhaps his pet scheme, shall we say, for his comfort, the advancement of his business or the good of the public in general. So it comes about that architects, when they receive tenders for work, find a little slip printed in red to the following effect:—

> "This tender is based upon the present standard rate of wages and is subject to adjustment in the event of any variation in such rates"

neatly stuck in a prominent position on the form of tender. It is one of the war products, this neat little slip, and who can say but that it has come to stay. If so it is the duty of every architect to give it his attention and provide for such an event as a rise or fall of wages in any contract for the production of which the architect is responsible.

For those who have not had any experience of dealing with the rise and fall of wages in a contract I suggest the following course should be pursued.

(1) The specification should contain a clause that the contractor is to furnish the architect weekly, when required, with copies of the weekly wages book or sheets, showing the number of men employed, the trade of each, the number of hours worked by each, and the rate of wages paid; this must apply to shop work and to sub-contractors, if the latter have given estimates to which the red slips are attached. It will be the duty of the architect to check, or have checked, the returns mentioned above, and if dealt with weekly no very great trouble will arise, but if left until the completion, when much is forgotten, contentious matters arise which are difficult at times to settle.

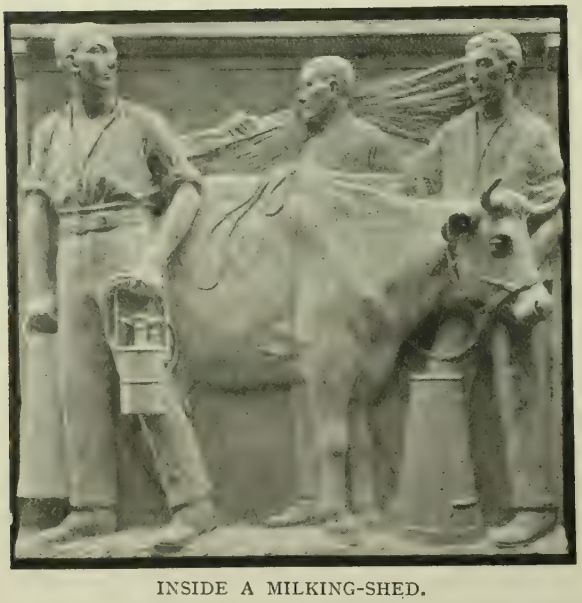
(2) Having got a satisfactory clause in the specification it is necessary to have some clause in the contract between the parties setting out clearly how the matter shall be dealt with. So many disputes on matters connected with building could be avoided if the rights and conditions between the parties were made clear beforehand.

The following clause as an addition to the R.I.B.A., 1909, form of contract is suggested.

"How Rise and Fall of Wages are to be dealt with.

"If between the date of delivery of the contractor's tender and the date for completion of the works comprised in the contract, alterations in the rates of wages of the trades engaged in carrying out this contract or any sub-contracts thereunder shall be agreed upon by the National Wages and Conditions Council for the Building Industry, such alterations shall be made and given effect to in the wages paid to workmen employed on this contract or sub-contracts, and the sum payable in respect of the works comprised in the contract or sub-contracts shall be proportionately increase decreased, as the case may be, to cove aforesaid alterations in wages, but on basis that any adjustment of the contract due to such increase, or decrease, i wages paid as compared with those ruli the date of delivery of the tender shall net addition or deduction, as the case ma without any increase or decrease of pro reason of such alterations in wages.

"This does not include anyone employ a weekly wage or on 'shifts.'



"Alterations in the price of material to apply to this contract."

Following this in the form of contract must be a schedule of the rates of wages to the various operatives at the date the t is sent in, and it is advisable that the of such persons as scaffolder, lorry machinist, improver, and shop boy, n mention others, should be included in th which will serve as a basic rate if alter should occur and have to be dealt with.

All the rates of wages inserted i schedule must be the agreed rates for th ticular district, not any "fancy" rates by the contractor. It will be noted tha clause proposed to be a part of the co document contains three conditions must be clearly borne in mind.

(*a*) That it is only an alteration of agreed by the National Wages and Cond Council for the Building Industry which affect the contract. (*b*) That the da which alterations of wages ceases is the given in the contract for the completion contract. (*c*) That wages paid weekly "shift" (usually the way a watchm paid) do not come under the rise and wages clause, as their wages are not lated by the hour. (*d*) That alterati the prices of materials do not apply contract.

Architects generally are not in fav any contract which makes the final c unknown amount, so are averse to th slips now sent out under the instructi the several associations to which builders belong, and it may be to the tage of some builders not to adopt t cate little attention intimating the r fall, but so long as architects *must* de the matter, it is very desirable tha should consider the above suggestions a to adopt some universal practice thro the profession.

SCULPTURE AND COMMERCE

w that advertising forms such an im-
nt part of industrial affairs, it is, per-
a compensation to the public that Royal
micians and increasing numbers of
etent painters are directing their talents
ds commerce. There is no technical
lty in accomplishing this transition. It
her different, however, for the sculptor
e his art for the benefit of commerce.
omething of this sort has been done in
xcellent plaques which surmount the
Zealand Pavilion at the British Empire
ition. A small army of art students
been let loose among the buildings at Wembley, and are using their brushes to some purpose in purely decorative schemes, but on the New Zealand Pavilion alone has any attempt been made to use the sculptor's art to portray commercial activity—in this particular case the principal primary industries of the country.

The New Zealand sculptor (Mr. A. R. Fraser, A.R.B.S.), whose work has appeared on several occasions in the Royal Academy, had less than a fortnight to devote to each of the plaques and the decorative spandrils, but from the photographs here reproduced it will be seen he has done full justice to the subjects treated. Each of the six panels are about eight feet square, and duplicate sets are placed between the cornice and "the string" on each wing of the building, and equidistant from the main door, over which are decorative spandrils. Even from fifty yards away the life-size figures may be seen to advantage, and when the sun shines the lights and shadows on the statuary produce a particularly striking effect.

In some of the panels there has necessarily been an effort to get a complete idea into the limited space, but apart from this licence, the scenes are wonderfully realistic and are obviously done by an artist who is personally acquainted with all the details of the scenes he has represented.

Holmside and South Moor Cottage Hospital Competition.

We give this week the design placed first in the Holmside and South Moor Cottage Hospital Competition, by Messrs. Buckland & Haywood, FF.R.I.B.A. A review of the designs submitted is given on p. 669.

New Premises for the Manchester & County Bank, Ltd.

The new premises at Hollingworth, which are situated on the main road, are built of brick and terra-cotta. The terra-cotta was supplied by the Hathern Station Brick & Terra-Cotta Co. The facing bricks on the side elevation are rustic bricks, supplied by the Ravenhead Brick Co. The building is roofed with reinforced concrete supplied by the Combined Concrete Construction Co., Manchester. The general contractors were Messrs. Edwin Marshall & Son, of Ashton-under-Lyne, and the fittings were also made by this firm. The locks and furniture were supplied by Messrs. Leggotts, of Bradford; lead glazing by Charles Lightfoot, Manchester; steel casements by Henry Hope & Son, Birmingham.

The Bank at Whitefield is being erected at the apex of forked roads immediately outside Whitefield Station. The apex forms the natural position of a rather important terminal feature, and the domed end of the bank has been designed as this feature, as far as a small building can fill the need. The building will be of Portland stone. The general contractors are Messrs. E. Marshall, of Ashton-under-Lyne; masons, Messrs. F. M. & H. Nuttall, Whitefield; concrete work, Combined Concrete Construction Co., Manchester.

Messrs. Mills & Murgatroyd (Mr. A. J. Murgatroyd, F.S.Arc., and Mr. J. Hembrow, A.R.I.B.A.) are the architects for both banks.

New Town Hall and Municipal Offices, Colombo.

We give this week a reproduction of a photograph of a three-sixteenth scale model of the New Town Hall and Municipal Offices, Colombo. The model was made of Ceylon wood by a Singalese carpenter under the direction of Mr. S. J. Edwards, A.R.I.B.A. (of Messrs. Booty & Edwards, Singapore, Penang and Colombo, architects).

The accepted design, by Mr. S. J. Edwards, M.A., A.R.I.B.A., was illustrated in issue of January 26, 1923. The building now being constructed departmentally by Colombo Municipality. The model is to be hibited in the Ceylon pavilion at the Brit Empire Exhibition.

From the American *Architect*.

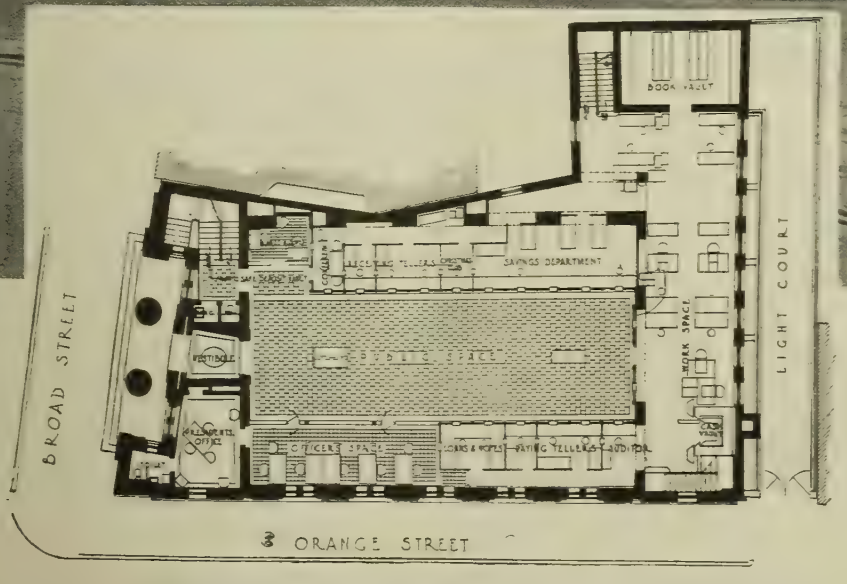
Decorative Window Glass.

The values which may be obtained fr the use of coloured glass without any addit of painted work, or only what might be necess where figures are introduced, was very grapl ally illustrated by the exhibition of Mr. Leon Walker's fine decorative glass windows, wh were shown by Mr. Selfridge's courtesy, the great stores in Oxford-street last we Mr. Walker has not studied glass design many years for nothing, and his command effects by well applied forms and colours tellingly exhibited by these beautiful windo intercepted for our pleasure here before t despatch to Singapore. The windows ar portion of a series for the banking hall of new premises of the Hong Kong & Shang Banking Corporation, Singapore, the archit for which are Messrs. Swan & MacLaren. scheme of colour is rich and dark in view its situation in a strong eastern light, and result is a remarkably brilliant and jewel- effect softened by the recurrent notes of blu colour in the general groundwork of the windo The work shows strikingly the value of g glass work in producing beautiful perman pictures of colour and light such as are denie any other material. When we get work this quality, which is harmonious in colour good in form, we may well take pleasure in permanence, and it is to be hoped that we s find many of our modern commercial struct enriched by windows like these for the H Kong Bank.

Bungalow at Potter Heigham, Norfolk.

This bungalow is intended for sum occupation only, and is in the nature of a t porary building. There is neither gas, wa nor drainage to the site. The site was pared for building by excavating to a de of 4 ft. over the whole, and filling with 3 ft clinker. The portion built on is covered w 6 in. concrete; the top soil being replace the rest of the site. The structure is a tim framed building, and rests on brick p allowing clear air space underneath. Exterr it is weather boarded, the architectural e being obtained by means of tar, paint, st and the use of wood trellis. The roof cove is "Ruberoid." The accommodation incl living room, with glass folding screen, gi access to the veranda; a small kitchen cooking will be done on an oil stove); t small bedrooms (fitted with two bunks h having lockers, cupboards, wash-hand st dressing table as fixtures). The object thro out has been to reduce the amount of furni required to a minimum. Boat house garage are also included.



The architects are Messrs. Percy Tubbs & Duncan.

British Institution Scholarship, 1923.

The subject of the British Institution Sch ship in Architecture for 1923 was a building in a country town. The site was an irregular one, the east front faci Market-square, and the south-east fronti residential street. The requirements incl a residence for the bank manager, and a l ing hall, approximately 40 ft. sq.

The Scholarship was awarded to Mr. H Chippindale, of the Leeds School of Art. had previously won the Walker Art Schola (value £20 for five years tenable at the School of Architecture); Leeds and Yorkshire Architectural Society's Silver and five guineas for Measured Draw Travelling Scholarship, value £60, aw jointly by the Leeds and West Yor Architectural Society and the Leeds Edu Authority.

By Mr. F. Chippindale, Leeds School of Art. *(See p. 674.)*

PRESENT-DAY ARCHITECTURE

N April 17, Professor A. E. Richardson ıred before the Architecture Club on this ject. In the course of his remarks he said rder to understand the building ideals now ogue it was necessary to focus attention on movement which had its beginnings fifty rs since.

pinion was gradually inclining to the view Victorian art of the last thirty years of the teenth century was not entirely barren of lts. By the year 1870 at least three coteries architects representing the talent of the ıtry were in opposition. There were the hicists, who fought to re-establish the direct ement of mediæval building; there were the sicists, who sought to keep alive the inishing flame of classicism; there were free lances whose aim it was to develop a lern style from the debris of the national lition.

was in this year (1870) that the Gothic val reached its point of culmination, ough for thirty years onwards its spirit continued. Sir Gilbert Scott was coming St. Pancras Station, and what teaching e was in the Architectural Schools, at the al Academy and University College, as well he lectures delivered by Ruskin in various ts of the country, had a definite bias towards liæval art and craftsmanship. On the other d the Classic spirit was by no means dead, s evidenced by many buildings now extant he City of London and other cities and towns he provinces. London at this date still pre- ed a ring of country within five miles of ring Cross, as yet unsullied by suburban ration and the spoliation of rural amenities. rt from the architects towered the gigantic res of Ruskin and William Morris, aloof n the strife and indignant at the non- eptance of their teachings by practitioners public alike. It was curious, and not a little netic in the light of present day events, to ıce back fifty years to note the keenness and enthusiasm, the wordy warfare, and the altogether ill results. Men were then alive were young when the eighteenth century it was in its last flush; some had imbibed the litions of Nash and Cockerell, others had been iples of Rickman and Pugin. There were in ition the civil engineers, now completely dis- ated from the architect; engineers of an earlier od, who, not thoroughly understanding r business sought to combine derived archi- ural form with adventure in steel.

architectural circles the desire seemed to been to attempt novelty by the eclectic nod, but it was significant that both archi- s and engineers failed to appreciate the ical significance of the unprecedented th of industry. In other words the whole ıe artistic effort of the country appeared to been concentrated on the task of masking strial expression in the vain attempt to se it and teach it deportment. John Ruskin William Morris, together with their imme- followers, alone realised the political signi- ce of art; they fought for an immediate re- ion of taste, a thing impossible of itself; ll unknowingly the leaven was at work, it was a tribute to the memory of these nced thinkers that nearly all of their lessons been taken to heart, but not quite in the they imagined.

was an age both sentimental and sincere; s adventurous in the sense that its enthu- dared to compete with past masterpieces; s literary in the sense that investigation hat could be readily studied in historical ng formed part of every architect's training. were to-day sufficiently in advance of that to read its tale with some measure of ıcy. The good buildings were very good, ernacular was respectable but depressing. architecture in other words exactly ex- d the age.

vas a little difficult to locate the beginnings modern movement, but there was suffi- evidence at Saffron Walden in Essex for them to assume that by the year 1874 a distinct adventure had been made by a group of talented architects. In the Market-place of this town civic enterprise had determined on building a new town hall, William Burgess being chosen for the work; at the same time John Bentley was commissioned to design the fountain, and it was left to Eden Nesfield to remodel the "Rose and Crown" hostelry and to design the adjoining bank. Considering the period the result was remarkable. Burgess endeavoured to recast the local timber tradition; Nesfield essayed a free treatment of Tudor and Renaissance for the bank, and made his additions to the "Rose and Crown" in a sort of florescent version of Queen Anne. Bentley was content to produce an elaborate Gothic fountain sprayed with ideas. Soon after the dominating personality of Norman Shaw appeared in London, and the tide of fashion turned to a resuscitated version of Queen Anne brickwork.

To recount the subsequent events would require many lectures; they would have to listen to a list of buildings and to the names of many architects who had long since left the stage to newer groups. It was important to remember, however, that the prevailing tendency was style, and that the well-defined paths of Gothic and Classic were at this juncture forsaken for the broad highway where freedom was encouraged. Side by side with the new movement the Gothic revival entered upon its last phase. There were the churches designed by Pearson and Brooks, the Record Office in Chancery-lane by Pennethorne. the man who had sat at the feet of Nash and had completed Somerset House, and the restoration—dreadful word—of innumerable churches throughout the Kingdom. On the Classic side, such fine buildings as the Royal College of Science and the Royal Albert Hall, both at Kensington, showed that on occasion real buildings of monumental stamp could be evolved.

For the next twenty years the vernacular took on a certain consistency in its higher flights. Norman Shaw assumed the leadership among the adventurers. Bedford Park came into being as the first of the new urban districts as distinct from the spiky productions of the speculative builders of the eighties, and among the more cultured of the people taste for domestic work of character was influenced by the drawings of Kate Greenaway and the wares produced by the Morris firm. As was inevitable, the speculative builder who trod close on the heels of the leaders did his best to ape their style.

As was inevitable, when any particular style or styles formed the theme, both architects and the public soon began to tire of the repetition of familiar features which proved the limitations of the styles selected. The time was ripe for a change, and this was brought about by the erudition of Sir Reginald Blomfield, who published his authoritative work on the English Renaissance in 1896. Henceforward all and sundry combined to re-establish the English manner of the late seventeenth and eighteenth centuries, there was an immediate response to the newer teaching, and a consequent outcrop of buildings in Portland stone as well as in brick. The period of criticism and research set in, every known source was investigated, and drawings were made of about every historical work which could claim distinction. The French exhibition of 1900 gave further impetus to the broadened Classic view point; and for a time English architecture came under the spell of the Beaux Arts. America had not yet fully developed her official style. From the year 1900 the character of London began to change; improvements were projected between Holborn and the Strand; it was determined at this time to rebuild Regent-street; the great improvement of the Mall was schemed and carried to completion; and in the West-End of London blocks of flats displaced groups of old town houses. From 1900 to 1910 ensued what might well be termed the "Competition Period," important municipal buildings being undertaken in all parts of the country. This, too, was the period for the building of medium-sized town and country mansions. There were, for example, the homely designs of the late Ernest Newton, the dignified Renaissance houses by Sir Reginald Blomfield, and the extraordinary number of unique houses by Sir Edwin Lutyens. It could be said of the period from 1900 to 1914 that English domestic architecture, thanks to the labours of the foregoing and other architects, was raised to the proud position it occupied at the present time. But the attention given to domestic architecture which contributed to its success was not entirely bestowed on works of civic importance, perhaps on account of the competition system, as well as the fact that until quite recently the value of sane building as a commercial asset was not understood by those interested in commerce.

It seemed incredible that scarcely twenty years since the apathy of the public towards the conventional scenery of cities was profound. Architectural education, too, was woefully neglected save for the privileged few who had studied at the Ecole des Beaux Arts in Paris, or at the Schools of the Royal Academy. It was, however, of moment to note that the leaders who laid the foundations of the present-day work had all benefited by the traditional system of pupilage, in itself a legacy of the eighteenth century, and it was entirely owing to the labours of those men that the present advanced system of education was in being. The present generation of architects had had the benefit of closer contact with other countries, there had been waves of ideas and reactions of thought from France and America.

Architecture was always responsive to events of political significance. From 1900 to 1914 it developed on certain well-defined lines with tendencies towards classical purity and excellence of technique in an ascending scale, to which it was helped by the prodigious output of books on architecture and the kindred arts as well as the growing appreciation of the scientific art on the part of the public. The American invasion of England began with the building of Selfridges; it had, it was to be hoped, reached its climax in the new Bush Building. Education had assisted in the teaching of archæology and history, it had proven the story of the past and made clear many traits and surface differences. The whole theory of planning had undergone revision, while the general practitioner was giving way to the man who specialised in definite types of building.

Reverting to present-day tendencies which it would be seen were the result of fifty years of slow and painful building up, they were confronted with the main issues of the times. The war completely disturbed the trend of events which, up to 1914, had been slowly developing on lines of intensive scholarship. The exigencies of war put architecture temporarily in the background, the demand being for direct and rapid construction pre-eminently for building associated with the production of munitions. Under such circumstances a lasting architectural expression was impossible. On the other hand, from the conditions of war was created a situation of political significance, namely, industrial housing on a great scale. Thanks to pre-war lessons, it had been possible for the younger generation of architects and even borough engineers to apply theories formerly thought only applicable to domestic works of the first rank, to the building of small houses, either in groups of two or in terrace formation. He submitted that domestic architecture of this type, with few exceptions, was truly representative of the time, and was remarkable for good taste in its expression as well as for ingenuity of planning.

A little thought would convince them that they had no reason to be ashamed of the work produced to-day; it was the result of much labour and the slow building up of a definite standard of taste to which all and sundry had contributed. Criticism had been keen and censure has been lavished without regard to conditions, for it was difficult for a critic to select the correct view point.

LEGAL SECTION

NOTES ON CURRENT CASES

Workmen's Compensation.

"Out of and in the Course of Employment."

THE decision of the House of Lords in the case St. Helen's Colliery Co. *v.* Hewitson (1924, A.C. 59), is one of the most important delivered in recent years and it requires to be studied in detail.

We gave a brief outline of this case in our issue December 7, but at that time only one of the judgments was reported and it was impossible to analyse the effect of all the opinions delivered in the House of Lords, but we now propose to give a detailed consideration to those judgments for they to some extent explain the law and they overrule some decided cases.

Shortly stated, the facts were that a man employed at the appellant's mine who resided some four miles from his work was injured by a railway accident on October 10, 1921, whilst travelling to his work.

He was in this train under agreement or license by his employers. The employers had entered into an agreement with the railway company to provide special trains for the conveyance of their workman to and from their work at a monthly charge made to the employers, and the employers had agreed to indemnify the railway company against any claims made by their workmen in respect of accident, injury or loss. The workmen who used these trains had to sign a form agreeing not to make any claim against the railway company, and when they had signed this form presented by the employers they received a pass enabling them to use the trains, and a sum of 1s. 8d. was deducted from their wages for the fare, which was considerably less than an ordinary workman's ticket. The men were not paid for the time occupied in travelling, and it was optional whether they should use the trains to reach their work or choose some other means of transport. Some, in fact, walked and others went by omnibus.

The House of Lords (reversing the Court of Appeal) held that as there was no obligation to use the train, the injury sustained by the workman did not arise "in the course of" the employment. Lord Shaw of Dunfermline alone dissented from this decision, which was arrived at by the other four Law Lords.

It is somewhat surprising that no satisfactory test has yet been devised which will give a definite rule for the interpretation of the expression "personal injury by accident arising out of and in the course of the employment," although this expression has been in use in connection with Workmen's Compensation some 27 years.

Lord Atkinson is reported as saying that the difficulties of reconciling the decided cases on this question has arisen from the omission on the part of some of the Courts to frame some test which must be satisfied to bring an accident within the course of the employment, and in the judgments delivered in the House of Lords certain tests are now suggested.

Before considering these tests we will first note the ground upon which the majority of the House of Lords held this accident not to have arisen "in the course of" the employment.

The Court of Appeal had decided in the man's favour on the authority of Cremens *v.* Guest, Keen & Nettlefolds (1908, 1 K.B. 469; *The Builder*, July 4, 1908), although it was found difficult to reconcile that decision with Davies *v.* Rhymney Iron Co. (2 B.W.C.C. 22).

The House of Lords has now distinguished these two cases. In the latter of the two cases it was optional whether the man should use a train offered for his convenience, and it was held that the accident did not arise out of and in the course of the employment, but in Cremens case the findings were not certain and it was not clear whether the train formed the only access to the man's place of work or whether he used it only as of right, or it was obligatory upon him to use it, and the House has now laid it down definitely that if there is only a right and no obligation to use a means of access or transport the mere license does not make the man availing himself of it acting "within the course of his employment" within the meaning of the Act, unless of course, that is the only means of access by which a workman can reach his place of work and in that sense he is compelled to use it.

Lord Atkinson suggested a test as to when a man is acting "in the course of" his employment, namely, when he is doing something in discharge of a duty to his employer directly or indirectly imposed upon him by his contract of service, but in giving this definition he added that it must be borne in mind that the word "employment" as here used includes things belonging to or arising out of it. Lord Atkinson approved the decision given by Lord Parker in Parker *v.* Owners of ship *Black Rock* (1915 A.C. 725) that in order to make an accident arise "out of" the employment it must have been done in pursuance of a duty owed to the employer, and he pointed out that the same test applied as to whether it arose in "the course of" the employment, following with approval the dictum to this effect laid down by Lord Finlay in Davidson *v.* McRobb (1918 A.C. 314; *The Builder*, August 2, 1918), that the word "employment" must mean the same thing when in apposition with "in the course of" as it means when in apposition with "out of."

Lord Wrenbury said that the words "out of" connote origin, and the words "in the course of" apply to the employment as such, its nature, conditions, obligations, and incidents, and the words "in the course of" are not equivalent to "during." More helpful than these general definitions may be some of the examples cited from other cases or given by themselves by the members of the House of Lords in this case.

Lord Dunedin, in Davidson *v.* McRobb (*ubi sup*) said: "It is obvious that the addition of the words 'in the course of' are meant in some way to qualify or further explain the words 'out of.' My own view is that they do the latter. It is in one sense difficult to imagine that there could be any injury held as arising out of the employment which would not also be in the course of the employment. But it may be well that the determination of the question whether at the moment of injury the workman was 'in the course of' his employment may go to solve the question whether the injury arose 'out of' the employment. Let me instance the case of a domestic servant who is run over in the street. Given but the two facts that the man is, *e.g.*, a butler and that he is run over in the street, you would not be able to decide whether the injury arose out of the employment or not, but given the further fact that either (1) he had been sent by his master on a message, or (2) that he is enjoying an evening out, then you can determine whether he is in the course of his employment or not, and from that, if being run over is an inherent danger of the streets, you will be able to determine whether the injury arose out of the employment or not."

Lord Wrenbury, in the case we are considering said that a useful test in many cases is to consider whether at the moment of accident the employer would have been entitled to give the man an order, and the man would have owed the duty to obey it.

Where a workman is injured whilst engaged in performing the actual work he is engaged to do, there can be no difficulty in determining that the accident has arisen both "out of" and "in the course of" the employment, but then, as we have shown above in Lord Atkinson's definition of the test, the word "employment" covers and includes things incidental to the employment. Lord Atkinson instanced several such incidents: haymakers going a short distance to get water to drink to enable them to continue their work, and workmen taking their food on the employers' premises. Lord Wrenbury gave other instances: men going down to work in a cage, or standing by for the next job; and he adds in every case the facts have to be ascertained and discrimination made between the time during which, or the place at which, the employment is being carried on, and those during or at which it is not being carried on.

It is these incidental acts which cause the difficulty, and Lord Wrenbury pointed out that the definition given in Gane *v.* North Colliery Co. (1909 2 K.B. 539; *The Builder*, July 10, 1909), "all those things that he is entitled to do by virtue of his contract, he is for the purposes of the Act employed to do and they are therefore within his contract of employment" is far too wide for as he points out a man by virtue of his contract may be entitled to take a holiday, or he may be entitled to take vegetables from his employer's garden but he is not entitled to the benefit of the Act when he is on his holiday or when engaged in digging potatoes for his own use.

Lord Wrenbury says the definition should read "all those things that in the course of his employment he is entitled to do by virtue of his contract he is for the purposes of the Act employed to do."

It appears, therefore, from the judgments in this case that the real test as to whether the accident has arisen both "out of and in the course of" the employment is, has the accident arisen from the man's performing a duty to his employer? Lord Wrenbury pointed out that does not mean that it was the man's duty to perform an act, but it is sufficient if the man is doing his duty at the moment. An example of this may be furnished by the case, Upton *v.* Great Central Railway, a case in the House of Lords, which we noted January 25 (now reported 1924, A.C. 302). In that case a man was returning from work by train, it being part of his employment to proceed to his place of work in return from it by train, and he slipped on the platform and sustained injury, and it was held he was entitled to compensation, and it was laid down that there must be some causal connection, not necessarily physical connection between the accident and the circumstances the workman had to encounter within the scope of his employment. This may be put in other words that the workman when he sustained injury was performing a duty to his employer.

Perhaps one of the most difficult cases to bring into line with the present decision is that of the House of Lords in Redfern *v.* Armstrong Whitworth (1920, A.C. 577), a case we commented upon in our issues April 16 and October 29, 1920, where a woman who had gone to a canteen provided by the employers and which it was optional for her to use, whilst hurrying back to work slipped on the stairs, and the majority in the House of Lords held she was within the . Lords Finlay and Dunedin, however, dissented from that judgment, and Lord Atkinson appears to suggest that perhaps the test now accepted was not applied by two of the Law Lords for the majority, but that in any case it does not weaken the test as laid down in Parker *v.* *Black Rock*, and now applied.

It is to be noted that Lord Shaw of Dunfermline, who dissented from the rest of the House in the case we are considering, practically agrees with the general principles laid down, but bases his opinion on the fact that the whole of the arrangements with the workman as regards transit by the railway company formed part of his contract of service, and thus the transit was directly connected with his employment, and he strengthened his argument by reference to the Truck Act. The case is certainly one

dship, for the man was deprived of any edy against the railway company by reason his agreement with his employers and yet without his right to compensation from his ployers, and there is much to be said for the w that if a man gives up his right, as one of the blic, against the carrying company that makes transit part of his contract of employment, so far as the general principles we have been eavouring to explain are concerned, Lord w's judgment practically accepts them, but differed on the construction of the particular ntract.

Mortgagee and Mortgagor.

We may draw attention to an unusual case, hergill *v.* See, briefly reported in *The Times*, cember 20.

The plaintiff in the action held a mortgage on ouse from the Rev. H. C. Kinred, and by mortgage deed it was provided that the rers of leasing conferred upon the mortgagor section 18 of the Conveyancing Act, 1881, uld not be exercised without the previous sent in writing of the mortgagee except in case of a letting for any term not exceeding ee years, a provision similar to that contained he lease in the case of Roberts *v.* Enlayde, ch we recently noted. The mortgagor had rever granted a lease of the premises to the endant in this action for a term of seven years rent of £50 per annum, six years' rent being d in advance, The mortgagor who was in ears with his payments of interest on the rtgage had left the country and this action brought against his tenant for trespass and eclaration that the lease was void *ab initio* gainst the plaintiff, the mortgagee.

For the defendant it was contended that ugh the lease was bad as it stood there was equitable jurisdiction in the Court to alter term of the lease so as to bring it within the ase in the mortgagee deed, *i.e.*, a lease for ee years, but the Court held that the express vision in the mortgage deed as to leasing le the case come under the rule of law which railed before the Conveyancing was passed, t is, that it was contrary to law for a mort- or to grant a lease without the consent of the rtgagee and therefore following the case hop of Bangor *v.* Parry (1891, 2 Q.B. 277), lease was absolutely void, and a declaration made to that effect, and 40s. damages for pass were awarded as against the defendant.

THE RATING OF LAND VALUES.

A Bill has been introduced by Sir John Simon read a first time, dealing with the ng of land values, and in introducing his Bill, John Simon referred to the old argument t the value of land was due not to the efforts he individual or his expenditure, but to the ivities and expenditure of the community, he claimed that his Bill would stimulate re- lding.

We have not the terms of this Bill before us, the party to which Sir John Simon belongs ed the taxation of land values before the tors at the last election, and the two subjects closely connected.

We imagined that the fallacy of this un- ned increment had been exposed in actual ctice under the Finance Acts, 1909-10, and the disastrous effects it had exerted on ding, even before the war, were now recog- d by all parties, but the first reading of this was passed by 244 votes to 119.

t is hardly necessary for us to declare that hese columns we take no party views on any ject, but we foretold the result of land taxa- before it was put in practice, and it would very disastrous to the already hampered ding trade were this principle again at- pted to be enforced.

t was favoured by the Liberal and Labour ties and was put in force for many years proved costly to the individual, unremunera- to the Exchequer, and disastrous to build- activity, and it was repealed by a Coalition ernment. In our present very serious culties, we hope that experience for once have taught its lesson.

PROPOSED AMALGAMATION OF THE R.I.B.A. AND SOCIETY OF ARCHITECTS

THE following is a précis of the proposals agreed between the Council of the Royal Institute of British Architects and the Council of the Society of Architects for the amalgamation of the two bodies :—

The Councils of the Royal Institute and The Society of Architects are agreed after a careful review of the situation from all sides that the interests of the profession, as a whole, will be best served by the amalgamation of the two Societies and a return to the position of 40 years ago, when the Society broke away from the R.I.B.A. on the Registration question.

They are further agreed that if terms satisfactory to Members of both Societies can be settled, such an amalgamation will undoubtedly strengthen the hands of the profession in dealing through one representative Society instead of two, with such questions as :—

(1) Registration.
(2) Education and the very complete system of schools which has grown up throughout the Empire.
(3) The control of Public Competitions.
(4) Professional Practice.
(5) Negotiations with Government and Public Bodies.
(6) Questions which continually arise between the profession and the public which it serves.

Both Councils realise that no terms can be arranged which will be equally agreeable to everyone, and that the members of each Society must make some concession to the common good.

Such an arrangement could only be suggested if, as both Councils believe, it is for the ultimate good of the profession and the public.

With this object in view the following terms have been agreed upon by the two Councils after much anxious consideration, and in due course will be recommended to the Members of both Societies for acceptance.

TERMS OF AMALGAMATION.

The Terms of Amalgamation conveniently group themselves under three main headings, and are to be embodied in a document agreed to by both Councils and circulated to the Members of both bodies.

(A) Membership.
(B) Action after Amalgamation.
(C) Finance.

(A) MEMBERSHIP.

1. (*a*) *Fellows of the Society*, approximately 170*, to become *Fellows of the R.I.B.A.*

(*b*) *Members of the Society*, approximately 980*, to become Licentiates of the R.I.B.A., with full corporate powers and the power of voting on all subjects, and the right to use the affix L.R.I.B.A. and the title "Chartered Architect."

(*c*) *Licentiates of the Society*, approximately 180*, to become Students of the R.I.B.A., with privilege of becoming Licentiates of the R.I.B.A. as and when they are qualified to do so. [See para. 3.]

(*d*) *Students of the Society*, approximately 130, to become Probationers of the R.I.B.A.

NOTE.—Provision to be made for Members of the Society who have passed the Society's Membership Examination, some 150 in all, to qualify for Associateship of the R.I.B.A. if they wish to do so, on passing a Special Examination in Design and in those subjects which are not included in the Society's examination.

2. The names of the Retired Members of the Society to be printed in a separate list in the R.I.B.A. Kalendar, and they are to enjoy the privileges of Retired Members of the R.I.B.A.

3. The qualifications to enable Licentiates of the Society to pass from the class of Students of the R.I.B.A. to the class of Licentiates of the R.I.B.A. to be drafted by the Council of the Society to correspond with the qualifications now in force to enable them to become Members of the Society.

4. Licentiates of the R.I.B.A. to be granted full corporate powers with full voting powers on all subjects with the use of the affix L.R.I.B.A.

5. All Fellows, Associates and Licentiates to be entitled to use the title "Chartered Architect" if they wish to do so, in addition to the appropriate R.I.B.A. affix.

6. The Society undertakes to cease approving candidates for membership as soon as the two general bodies have ratified the terms of the amalgamation.

7. Further, as these proposals entail alterations to the R.I.B.A. Charter and By-Laws, it is intended to ask the Privy Council to authorise the following additional alterations at the same time, which, it is believed, will facilitate the working of the Institute machinery—*i.e.*, proposals :

(*a*) To ensure a more adequate representation upon the Council of each corporate class.

(*b*) To effect continuity of a Council's policy by limiting the number of its Members put up for re-election annually.

(*c*) To increase the representation of the Allied Societies, including those overseas, on the R.I.B.A. Council.

(*d*) To enable important questions of Institute policy to be submitted to a referendum of all Members in lieu of a General Meeting in London only.

NOTE.—The following information is given to enable Members to see the effect of these proposals upon the Membership of the R.I.B.A. :—

* The remainder of the Fellows, Members and Licentiates of the Society, are already Members or Licentiates of the R.I.B.A.

BEFORE AMALGAMATION.						AFTER AMALGAMATION.	
Approximate Membership of the R.I.B.A.			Approximate Membership of the Society of Architects (October, 1923).				
Fellows	960		Fellows	200†		F.R.I.B.A.	1,130
Associates	2,350		Members	1,137		A.R.I.B.A.	2,350
Licentiates	1,380		Licentiates	167		L.R.I.B.A.	2,347
Students	293		Students	130		Students, R.I.B.A.	455
Probationers	500					Probationers, R.I.B.A.	630
TOTAL	5,483		TOTAL	1,634		TOTAL	6,912

† These figures include a certain number who are already Members of the R.I.B.A.

It is estimated that at the end of 10 years, at the normal rate of increase of the Associates and decrease of the Licentiates by wastage, the figures will be approximately :—

Associates	3,000
Licentiates	1,500

No provision is made for the admission to the R.I.B.A. of any unattached Architects other than the above, except through the ordinary channels, but it is hoped that many may be induced to join their local Societies allied to the R.I.B.A., and thereby assist towards the complete unity of the profession.

(B) Action after Amalgamation.

1. The R.I.B.A. undertakes, immediately upon the ratification of the terms of amalgamation, to appoint a Registration Committee upon which the Society shall be equally represented with the R.I.B.A. to draft and carry through its various stages the Registration Bill until it becomes an Act.

2. The Society undertakes, when the amalgamation is completed and the transfer of members effected, to begin to take the necessary steps for the winding-up and dissolution of the Society.

(C) Finance.

1. The Members of The Society of Architects joining the R.I.B.A. will not be required to pay entrance fees. The subscriptions for all Members of the various classes of the R.I.B.A. to be as follows :—

Fellows	£5 5*s.* 0*d.* per annum.
Associates & Licentiates	£3 3*s.* 0*d.* per annum.
Students	£1 1*s.* 0*d.* per annum.

2. The surplus of assets over liabilities of the Society was estimated at the last audit in October 1923 at £7,000. It is estimated that if the scheme is carried through the R.I.B.A. will have an additional income of between £5,000 and £6,000 a year.

APPENDIX.

Opinion of Mr. Edward Shortt, K.C.

On the advice of the Parliamentary Agents of the R.I.B.A., the opinion of Mr. Edward Shortt, K.C. (late Home Secretary), was obtained.

The case submitted to Mr. Shortt and his opinion upon it are appended.

Royal Institute of British Architects.

Memorandum for Opinion of Counsel.

1. The architectural profession demand that a serious attempt should be made to obtain the Statutory Registration of Qualified Architects.

2. At present there are two independent professional organisations in this country :—

(*a*) The Royal Institute of British Architects, with over 5,000 members and students and a network of "Allied Societies" and Branches (37 in number), covering the whole country, and embracing several thousand additional members. The R.I.B.A. is the Royal and Chartered body founded 90 years ago to foster the art of architecture and protect the interests of the profession.

(*b*) The Society of Architects, founded 40 years ago, an unchartered body of some 1,600 professional members and students, completely independent of the R.I.B.A. and endeavouring to discharge similar functions to those of the R.I.B.A.

3. The Society of Architects have declined to support and would almost certainly oppose a Registration Bill promoted by the R.I.B.A. on the only lines which are acceptable to the Council of the R.I.B.A., but would support a Bill which provided for the establishment of a new federal organisation to control the whole profession.

4. The R.I.B.A. will not promote or acquiesce in a Bill which hands over the control of the profession to a new body independent of the R.I.B.A., and will only support a Bill which confirms the chartered position of the R.I.B.A. as the supreme governing body of the profession.

5. As a way out of this *impasse*, the Council of The Society of Architects propose to dissolve their Society on condition that their members are admitted into the R.I.B.A., so leaving the R.I.B.A. with its network of "Allied Societies" as the sole and supreme professional organisation of Architects in the Kingdom.

6. If this solution is accepted, there is no obstacle to the drafting of a Registration Bill on the lines desired by the R.I.B.A.

The opinion of counsel is desired on the following question :—

"Has the R.I.B.A. a better chance of success with its Registration Bill if it absorbs The Society of Architects as suggested in paragraph 5, or if it leaves the Society in its present independent state ?"

Opinion.

Having regard to paragraphs 3 and 4 of these instructions, I do not think that any Bill could succeed in present circumstances. But if The Society of Architects dissolve, as suggested in paragraph 5 of these instructions, and the Members are admitted into the R.I.B.A., the hands of the R.I.B.A. would be immensely strengthened. Coming to Parliament, as they would, for the protection of the public as well as for their own better regulation, they would speak with the united and unanimous voice of the whole profession. I am of opinion that their chances of success would be infinitely greater than they would be in present circumstances.

E. Shortt.

3, Hare Court, Temple, E.C.1.
April 9, 1924.

Both the Royal Institute and the Society of Architects have issued statements referring to the scheme.

The R.I.B.A. states: "It is proposed that the R.I.B.A. should absorb the Society of Architects. The proposal is supported by most of the leaders of the profession, because of its immense value in dealing with all matters on which it is desired to influence public action, apart from and in addition to the question of registration.

"(1) As a Council we have declined, in the interests of the R.I.B.A., to consider a registration policy which does not leave the R.I.B.A. supreme as the registration authority.

"(2) The Council of the Society of Architects could not see their way to support an R.I.B.A. Bill on these terms, but offered to consider the dissolution of their Society and the absorption of their members by the R.I.B.A. as an alternative.

"(3) As it was obvious that no success could be achieved if an organised body of architects, such as the Society, numbering some 1,700 members, were not in agreement with our proposals, we agreed to consider absorption, providing the position of our examined classes could be secured and no new class of members created.

"(4) The terms now submitted embody these vital principles. The R.I.B.A .will then occupy the undisputed position of being (with its allied societies) the only organised body of architects in Great Britain, the Associate class still retaining its distinction of being composed solely of men who have passed our examinations.

"(5) The class which will be mainly increased in numbers is the Licentiate class. This is a dying class, and by the effluxion of time will cease to exist altogether, leaving the R.I.B.A. with Fellows and Associates only, and no further admittances to membership without examination.

"If returned to office the Council will at once submit to the General Body proposals for confirmation.

"That members of the Royal Institute will support these proposals and take a broad and statesmanlike view of the situation is the earnest wish of the Council and of the members of the Allied Societies' Conference."

The Society of Architects states: "There are indications that any criticism by members may be directed chiefly to the proposal to transfer them to a class of 'Licentiates' within the Institute, but this class of 'Licentiates' must not be confounded with the present one, the members of which have no corporate existence within the Institut The new class of 'Licentiates' are to ha full corporate membership of the R.I.B.A and voting powers on all subjects, includir the Charter and By-laws, and the right describe themselves as Chartered Architects ar to use the affix 'L.R.I.B.A.' The Society proposal was for the new class to be describ as 'Members' of the Institute, but inasmu as the term 'Member' in a general sen would include Fellows, Associates ar Licentiates of the R.I.B.A., its use could n be restricted to one class of membershi There are some who consider the designati 'Licentiate' as suggestive of higher qualific tions than that implied by 'Member.'

"The only object of the Council of t Society in agreeing in principle to amalgam tion with the Institute is for the purpose accomplishing the main object for which t Society was founded and is being carried o viz., the attainment of statutory registrati of architects. The Council of the Society of the opinion that such amalgamation is necessary preliminary to registration, and th the chance of obtaining statutory registrati will be enormously strengthened and increas by amalgamation with the Institute, which itself pledged to pursue the same object ar has given an undertaking to the Society, the event of the amalgamation taking plac to promote a Registration Bill and to purs it until it becomes an Act.

"The Council trusts that if and when t time comes that the members of the Socie are called upon to make a decision in rega to amalgamation, they will regard the pr cess of absorption merely as a means to end, and that any who for personal reaso might, in normal circumstances, have f disinclined to accept the proposed terms transfer will realise that they are the me bers who, if they are far-seeing and generc enough to put aside personal feelings a support the Council, will be amongst the without whose aid it would have been i possible for the Society to take advantage the opportunity now afforded it of accompli ing the main object for which it was founded

MEETINGS

Saturday, *April* 26.

Royal Institute of British Architects.—Visit Kensington Palace.

Monday, *April* 28.

Illuminating Engineering Society.—Discuss on "Some Problems in the Lighting of Tex Mills," by Mr. E. L. Oughton and Mr. P. Waldram. At 18, John-street, Adelphi, W.C 8 p.m.

Architectural Association.—Mr. H. Crich Millar on "The Role of Phantasy in Lif At 34, Bedford-square, W.C.1. 7 p.m.

London Society.—Dinner. At Hotel Victo W.C.2. 7.45 p.m.

Tuesday, *April* 29.

London Association of Master Decorator Annual General Meeting.

Builders' Clerks and Benevolent Institutio Annual Dinner. At King's Hall, Holb Restaurant. 6.30 p.m.

Wednesday, *April* 30.

Royal Society of Arts.—Sir H. Maybury "London Dock District and Its Roads." 18, John-street, Adelphi, W.C.2. 8 p.m.

New Hospital at Epsom.

The new West Park Mental Hospital, wh the London County Council has had built its estate at Epsom, and which is to be ope by Mr. Wheatley, Minister for Health, June 20, occupies 97 acres, and will have about £750,000. There will be accommoda for 2,000 patients, and the institution is fourth of its kind on the L.C.C.'s Epsom es of 1,040 acres.

WAGE DISPOSAL FOR COUNTRY HOUSES

By H NAY C. ADAMS, M.Inst.C.E., M.I.Mech.E., F.R.San.I.
(Lecturer on Sanitary Science, Northern Polytechnic Institute).

E sewage from isolated or independent ences, or blocks of cottages, may be dealt by a conservancy system or a water-carriage m. In the former the excretal matter is ted in pail-closets or privies, which are ied periodically and the contents buried e ground, while the slop water and liquid s are either thrown on to the garden d, or, preferably, discharged into drains convey it from the immediate vicinity of dwelling. In a complete water-carriage m water-closets are used and the whole e foul matter from the premises is collected system of drains.

ere are several alternative methods of g with the sewage delivered by the s. It may be collected in a cesspool, should be watertight and sufficiently large ld about three months' flow of sewage. revent the cesspool filling too quickly, all ater should be separated from the foul and should be carried off by a distinct set ains. In order to avoid the expense and asantness of emptying the cesspool it is times allowed to fill up and overflow on to venient plot of land, but this is an undesir- arrangement because in such circumstances ewage is in a highly septic condition and ot be exposed on the ground without e. Further, during frosty weather the e will pond on the surface, while during weather the ground will tend to become logged, and during some of the remaining growing crops are better without the ation of sewage; consequently overflows enerally prohibited. The manurial value sewage is small, as it is diluted with such a atively large volume of water, but if it is desired to put it on the land it should low through a small tank, holding about he daily flow, to intercept the solid matter. accumulated matter should be removed this tank weekly, and some arrangement be made for dealing with the liquid during times as it cannot be put on the land. her method is to pass the sewage through a entation tank and dispose of the liquid by rigation, or alternatively the sewage may mpletely purified, when the effluent water e discharged into any convenient ditch or . The cesspool system is certainly cheaper st cost than a proper purification plant, s emptying is a continual source of expense, as usually performed, is a most objection- peration. Except for very small property, the quantity of sewage is similarly small, ification plant is decidedly to be preferred. sanitary and convenient, and the cost of p is negligible; it requires very little vision, but such should be given regularly; f properly designed and managed with ry intelligence it will purify the sewage fter year without any nuisance from smell herwise.

effective and economical purification and al of the sewage from isolated habitations of the most difficult problems of sanitary e on account of the small and highly- ntrated volume of sewage, the variable and the frequent rushes of bath and ry waters. From the structural point of difficulties usually arise from the absence icient slope in the surface of the ground to the sewage to be treated and discharged h a level that it will gravitate freely to natural stream which will carry it away. uantity of sewage to provide for is cal- d on the basis of a certain number of s per day per head of the persons present house, and varies within wide limits. responds very closely with the quantity of used, for, after all, sewage is only the pure supply fouled by soap, grease and other ties resulting from the cleansing of houses ensils, from personal ablutions and from y processes, together with urine and fæces emanating from the body. For cottage property with water-closets and fixed baths the quantity may be 15 gallons per head per day, but if such fittings are not installed the quantity may be as low as 10 gallons. For larger property, hospitals, &c., 40 gallons per head per day is not an excessive allowance, while for industrial schools and public institutions 30 gallons may be expected. Visitors must be included with the residents, and allowance should be made for horses (15 gallons per day) and carriage and car-washing (8 to 15 gallons per day each).

The design of the works must necessarily allow some latitude in the quantity of sewage that can be dealt with, but it is equally detrimental for the allowance to be excessive as to be insufficient. If the number of persons in residence varies greatly from time to time it is advantageous to arrange the installation in two parts, only one of which would be used when the daily flow of sewage is small. Generally speaking, the greater the volume per head the weaker the sewage. The presence or otherwise of water-closets does not materially affect the strength of the sewage or the difficulty of purification. The purification of sewage is partly a process of digestion whereby the fætid organic matter is resolved into its harmless elemental parts, and water-closet sewage has already been digested to some extent in its passage through the body, while it also brings with it a considerable volume of diluting water. It is a mistake to think that sewage requires less treatment when there are no water-closets.

The purification of the sewage is effected by micro-organisms consisting of low forms of animal and vegetable life which multiply very rapidly. It has been stated that sixteen million organisms are produced in one day from one bacterium These organisms exist in the sewage itself and are retained in the purification plant while the sewage passes slowly through it. The plant should be devised to provide suitable environment for the organisms to develop, and to maintain them in a high state of efficiency. The organisms consist of anaërobic bacteria living and working without air and aërobic bacteria which require an ample supply of light and air. The function of the former is to break down and liquefy the organic compounds and reduce them to simpler forms, while the aërobic bacteria oxidise and nitrify the organic matter in solution and complete the purification of the sewage. It follows, therefore, that a complete plant must consist of two distinct portions—first, a tank where the greater part of the solid matter in suspension is intercepted and partially liquefied, and, second, a bed for the aërobic bacteria, called a filter, freely exposed to the air, to render the organic matter harmless and the effluent fit to discharge into any small water-course. A typical arrangement is shown in Farrer's improved automatic distributor illustrated in Fig. 1. Proposals are frequently put forward for treatment of sewage in tanks only, on the assumption that the resulting liquid is "half" purified and that as the visible solid matter is extracted no harm can result from the discharge of the effluent. This is totally wrong, as the sewage is not partially purified but only prepared for purification, and the liquid is actually more offensive than the crude sewage, because decomposition is in a more advanced state.

Septic sewage is that which has undergone extended decomposition under anaërobic conditions, and a septic tank is one designed and worked to produce that result. Any tank will become a septic tank if it is of large capacity relative to the daily flow at the time, and if the sludge is allowed to remain for long periods in the tank. A tank through which the sewage passes in a short time and from which the sludge is removed frequently is called a semi-septic, non-septic, liquefying, or sedimentation tank. In the case of town sewage the operation of breaking down the solids in suspension is commenced during the passage of the sewage through the sewers, and sewage travelling some distance is partly septicised when it reaches the works; consequently the period of detention in the tanks has been reduced so as to stop the anaërobic action from proceeding too far, because septic sewage is more difficult to treat on open filters.

In the case of private installations the circumstances are quite different. The sewage reaches the outfall in a few minutes, paper and fæces arrive in an unbroken condition, and the suspended solids in the slop and waste water are practically unacted upon. Obviously, a longer period of detention must be given before the sewage is suitable for treatment on a filter. The discharge of large volumes of hot waste water from the house is detrimental, but the effects can be nullified by a fairly large tank, the liquid in which will exert a cooling effect. As the sewage passes through a tank the light flocculen

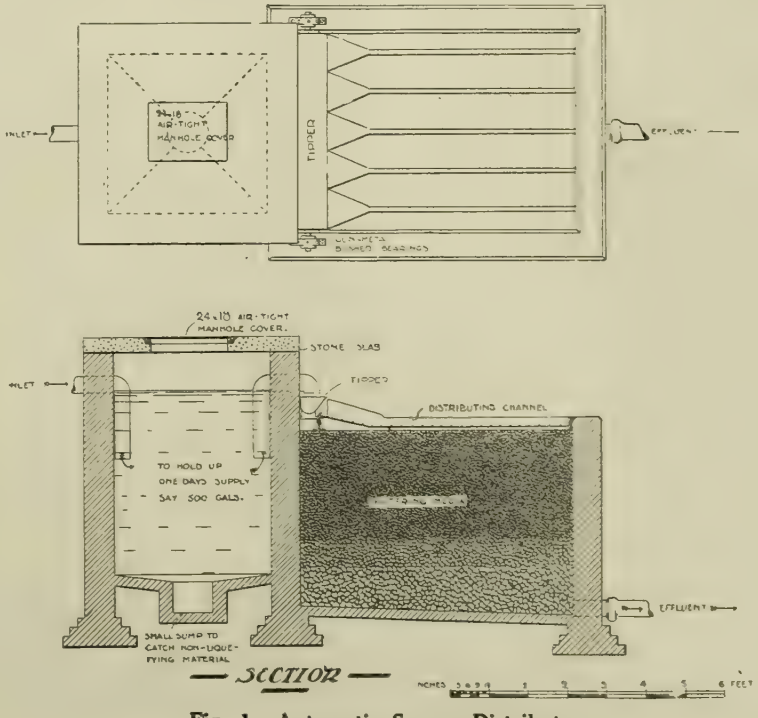

Fig. 1—Automatic Sewage Distributor.

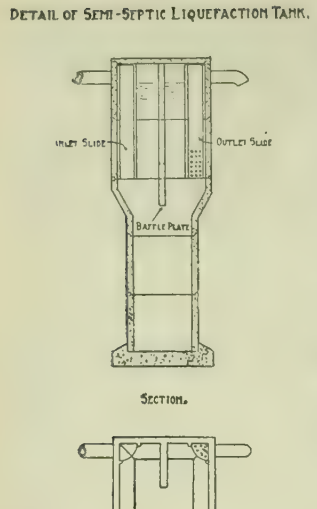

Fig 2.

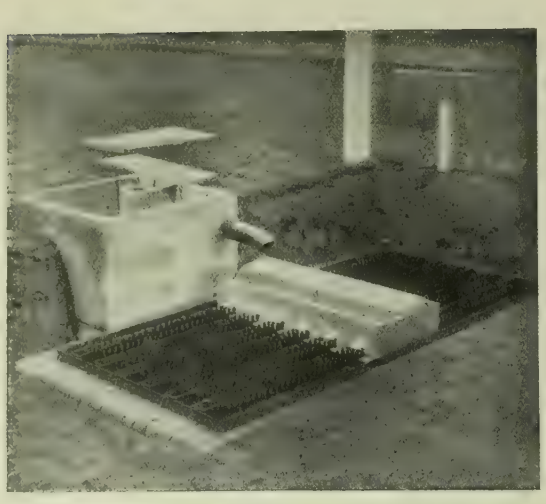

Fig 3.—Semi-Septic Tank and Filter Distributor for House with Ten Persons.

matter rises to the surface and forms a scum, while the heavier suspended matter sinks to the bottom as sludge. The liquid at or about the middle of the depth of the tank is therefore fairly clear, consequently the outlet should be arranged to draw off the liquid at a level 15 in. to 24 in. below the surface. The inlet should be similarly submerged to prevent disturbance of the scum or sludge. For the same reason the total depth of the tank should be from 5 ft. to 6 ft. In order to secure the necessary detention of the liquid, the volume of the tank should be equal to from one to one-and-a-quarter times the total daily flow. The rate of inflow to the tank will correspond with the flow of sewage from the house and may vary from nil to forty times the average flow. The best results would be obtained by an even rate of flow through the tank, but as this is impracticable the area of the tank should be comparatively large so that a sudden flow of bath waste shall not unduly raise the surface level and increase the "head" of discharge; and the outlet should be restricted or controlled. A small pipe, say, 1½ in. diameter, or an orifice, would effect the retardation of the flow through the tank, but they would be very liable to become choked in use without constant cleaning. A floating weir with narrow outlet gives good results, but it is expensive; it allows any rush of bath or laundry water to pond up in the tank and flow out at an even rate. In order to effect a thorough mixing of the fresh sewage with that already in the tank, the inlet and outlet should be arranged to prevent a straight flow through, thus an elongated form of tank is desirable; a proportion frequently adopted is length twice the width. In the tank designed by Messrs. Tuke & Bell (Fig. 2) the circulation of the liquid is brought about by a baffling partition wall. Fig. 3 shows a complete installation by the same firm. It will be desirable generally to cover the tank to prevent the possibility of smell, but ventilation should be provided by means of a fresh-air surface inlet and 3 in. vertical outlet shaft at least 6 ft. high. A sump should be formed in the floor in a convenient position to permit the insertion of a pump for the removal of the sludge. The sludge resembles watery mud in consistency, and can be easily removed with a chain pump of the usual type.

The filter may consist of any hard vesicular material with a rough, unglazed surface, and that is not likely to break down or disintegrate under the weather and working conditions. Gasworks' or destructor works' clinker is good, but there is apt to be too much coke mixed with the former. Coke will probably crush in the bed, and the resulting dust may interfere with the porosity of the filter. Blast-furnace slag is extremely good if the glassy type be avoided. Gravel is not desirable, as the surface is too smooth to afford safe lodgment for the bacteria, which may be washed away by an excessive flow at any time. Burnt ballast is undesirable, as in use it tends to revert to a clayey character and solidifies in the bed. The material should be freed from all dust and be washed before use. In forming a filter a concrete foundation, 6 in. thick, is laid over the site with falls to one point for the discharge of the effluent. On the concrete, two or three lines of 3 in. butt-jointed field pipes are laid, converging to the outlet. It is advantageous slightly to recess the surface of the concrete to form cradles for these pipes. The pipes are then surrounded and covered with a layer 6 in. thick of large clinker, say, 4 in. gauge, and then the remainder of the bed built up with material broken to ¾ in. gauge. The total depth should be about 5 ft., but if the available fall is limited the depth may be reduced to 3 ft. as a minimum. The quantity of material required depends upon the strength of the sewage; a good result should be produced with 1 cub. yard to every 50 to 70 gallons of the daily flow. The outside of the bed may be enclosed with light concrete or brick walls, or encased with expanded metal supported on a light T-iron framework.

A new filter has no purifying effect, but after sewage has been run through it for some time each particle of the material in the bed becomes coated with a layer of bacterial growth. The sewage is distributed over the surface of the bed, and as it slowly trickles or percolates through it comes into intimate contact with the bacteria, and is converted into a clear, harmless liquid. An even distribution of the sewage over the surface is an essential to success, and many designs of distributors have been evolved to effect this. Two types are shown in Figs. 1 and 3, which consist of a number of troughs from which the sewage overflows fairly regularly on to the surface of the bed. Another design, the invention of Mr. F. Wallis Stoddart, is shown in Fig. 4, and consists of a plate with V-shape corrugations slotted at the top and having holes in the bottom through which nails are placed. As the sewage fills up in the troughs it overflows and runs down to the underside of the V, where it collects and drops from the bottom of the nails in the form of a fine rain. A distributor which involves the discharge of the sewage through small holes is generally very efficient, but requires frequent attention owing to the tendency of the holes to clog up. With a small and very variable flow, as from a domestic installation, it is necessary to provide an automatic tipper which collects the sewage flowing from the tank and which falls over when full, ejecting the sewage through all the distributing channels on one half of the bed. The tipper in its position is then ready for discharging on other half of the bed as soon as it is full ag

If the levels permit, the effluent water be run direct into a small stream, but desirable that the flow of the stream sh exceed that of sewage in the ratio of at 5 to 1. If such a stream is not available, sometimes in view of other circumsta double filtration is desirable. In such two filters are constructed at such levels the effluent from the bottom of the first flow on to the top of the second, at the bo of which the final effluent will be deliv To obtain a scheme worked throughou gravitation a fall of about 8 ft. is desir although one could be arranged with sli less. When a suitable fall is not availabl extra tank has to be constructed to collec effluent from the filter. The capacity of tank depends upon the frequency with whic contents are pumped out; the liquid is and can remain in the tank an indefinite pe Any efficient pump can be used, worke hand or power. If automatic pumpin required a wind engine and pump ma useful combination.

If the soil is fairly light, the sewage, passing through a tank, may be dispose by sub-irrigation, thus avoiding an arti filter bed. About 1½ square yards of lan required for each gallon of the daily The plot should be prepared by laying ordi 3 in. perforated butt-jointed pipes with j ½ in. apart, in grid-iron form, at a dept 12 in. below the surface of the ground, falling about ½ in. per yard towards extremities. Junction boxes with stops sh be provided to regulate the flow. A syph or tipper discharge should be used to e the sewage reaching the extreme limits o irrigation ground, and the main delivery should be close jointed. Each discharge sh be sufficient to fill all the pipes. The d buting pipes will require to be taken up peri ally and cleaned; it is, therefore, desirab lay them on narrow concrete beds, sli hollowed, which not only form guides fo pipes, but ensure their being laid and m tained in correct lines and gradients. sewage will become puirfied as it sinks thr the ground, and may be allowed to flow through natural courses provided no su water in the neighbourhood is used for dri purposes. Where necessary the ground ca under-drained to collect the effluent by field pipes laid at a minimum depth of but, of course, a safe outlet must be provi

There are no patents in the principl sewage purification, nor in the design o works for the purpose as outlined herei there is plenty of scope for individual but certain fittings, such as the distribu of which there are numerous patterns, protected. It is impossible to advocate particular method; each case must be consi and the solution rest on the judgment o sanitary engineer.

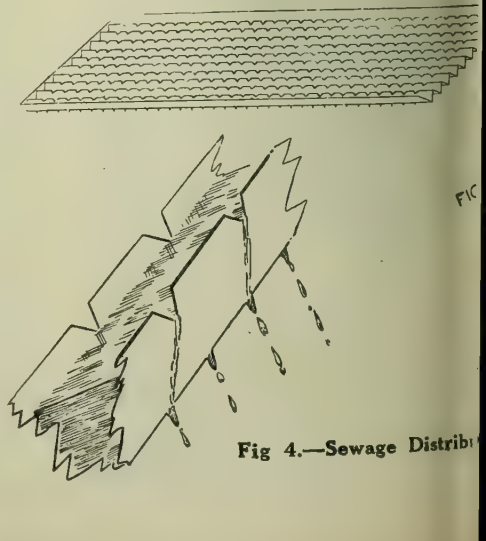

Fig 4.—Sewage Distribu

ELECTRIC LIFTS

At a recent meeting of the Institution of ectrical Engineers Mr. H. Marryat read a per entitled "Electric Passenger Lifts."

After giving some historical notes on the bject he said given the necessary particulars a building the lift engineer would be able to lculate the probable traffic. It must be mitted, however, that the lift engineer himself l not usually employ any scientific method in iving at the number of passengers per minute ich would require lift service on each par- ular floor during the busy part of the day. ch would draw upon his own experience and me-made formulæ. If these could be collated e general advantage would be served and ny mistakes avoided.

Some interesting figures derived from Ameri- n practice were given in a paper by Mr. rrison P. Reed from which it was learnt that New York City from 65 to 100 sq. ft. of rent- le floor space was the average allowance per rson occupying an office building. In other ies the allowance should be increased to 0 sq. ft. per person and it was estimated that ift service should be provided to empty such ildings above the first floor in from 40 to 60 nutes. It was, however, doubtful if American ures of that description applied to this untry. The only English pronouncement at he could find was contained in a paper read cently by Mr. C. H. I. Day, in which he said— ferring to a large office building—that the erage density of population was about 120 sq. of floor space for each occupant, but when e or two large firms occupied a whole building e population was almost certain to be denser an this, amounting perhaps to as much as sq. ft. of floor space per person.

In the absence of any definite information on at point, Mr. Day said it was considered safe assume about 110 sq. ft. per person as a fair erage. He also said that in buildings where sts had been made the rate of traffic flow at the siest time of the day had been found to be ch as to include the equivalent of the entire pulation of the building in 45 minutes, and at the passenger traffic could be predeter- ned by allowing for a period of rush from 15 20 minutes, during which time a number equal one-third of the population of the building s dealt with.

Figures derived from his own observation re not in agreement with this; he had not t amassed sufficient data to permit of his king an authoritative pronouncement.

In the first place the buildings in which lifts re usually installed had been divided into arge number of classes and each class had been parately examined under conditions which, believed, applied to that particular class. r instance, in large drapery establishments l multiple-store buildings he counted the mber of persons per minute proceeding from ground floor to upper floors. In office buildings of the class usually sub-let to a large number of different tenants he took no notice of persons arriving at or departing from the basement, ground floor or first floor, but made a count upon the second floor of all persons arriving at, passing, or departing from that floor. In office buildings in which several or all the floors were occupied by the same tenant—an insurance office, for instance—he counted the number of persons arriving at and departing from each floor, so as to check the inter-floor traffic; and in buildings where there was a restaurant on one of the floors a separate census was taken of the number of persons arriving at and departing from the restaurant, in order to check the special traffic so created. In taking that census of traffic in existing occupied buildings, he had at the outset been faced with the fact that existing lift accommodation was, in almost every instance, insufficient. It had been necessary, therefore, to count not only persons using the lifts but also those using the staircases.

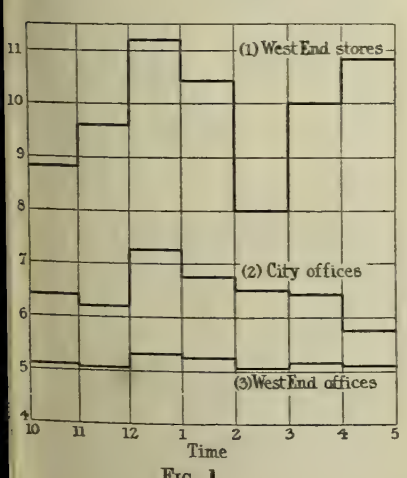

Fig. 1.

In Fig. 1, curve (1) represented the average traffic counted in a group of West End drapery establishments. In each case the number of persons proceeding per hour from the ground floor to any other floor had been counted, and the curve represented the average of all establishments examined. Curve (2) represented a similar average deduced from a count taken in a large group of City office buildings of the class in which the floors were sub-let to a variety of tenants. The curve indicated the number of persons per hour who arrived at or passed the second floor. In order to obtain a more accurate estimate of the period between 1 o'clock and 2 o'clock mid-day, the more detailed curves shown in Fig. 2 were prepared. The third example in Fig. 1 comprises a similar group of offices situated in the West End of London. The different characteristics were strikingly shown. In the latter case there was no "rush" period, so that in order to provide the same lift facilities for the same population, less lift capacity was required.

To arrive with more accuracy at the lift capacity required for a City office building of the class usually sub-let to a variety of tenants, it would be observed from Fig. 1 that the largest amount of traffic occurred between noon and 1 p.m. As the effect of the dinner-hour traffic was not clearly indicated, it was decided to take detailed observations over the whole period from 11.30 a.m. to 2.30 p.m. in order to arrive at the true maximum traffic requirements on the building.

Eleven office blocks comprising both large and small buildings were selected. In every case care was taken to watch not only all lifts but all staircases simultaneously. A count was made upon the second floor of every person arriving at, departing from, or passing that floor in each direction. The result of that count had been carefully reduced to persons per hour per 1,000 sq. ft. of rental floor area above the first floor. The observations were recorded at the end of every minute, and plotted for each separate building in the series of curves shown, the average of which was given in Fig. 3. Some interesting things might be learnt from this. It would be noticed at once that the traffic was inclined to move in bunches, and that had the observations been taken over 2-minute intervals the curve would have been very different in form. A curve had been prepared to illustrate this, and showed clearly the errors likely to arise from taking a count over any period longer than one minute, as it was the maximum traffic, and not the average with which the lift engineer had to deal.

Fig 3 showed that the average traffic per hour per unit of floor space taken during the period 11.30 a.m. to 2.30 p.m. was approximately 6.98, and between 12.10 p.m. and 1.10 p.m., 7.5. If, however, provision were made for the average traffic only, it was obvious that many people would either wait for several minutes for lift service or use the stairs in preference.

It might be considered unnecessary to provide accommodation calculated upon a maximum traffic which might only occur during a single minute of the day, but in that connection it must be remembered that the curve itself was an average of 11 typical buildings and that the maximum of 9.6 must be compared with the maximum of over 20, shown for a 1-minute period on three of the individual buildings. It was reasonable, therefore, to provide for the maximum indicated in Fig. 3.

The effect of providing a lesser lift service might be gauged by reference to Table 1, which gave figures for City (London) office buildings.

Table 1.

Lift capacity in persons per hour per 1,000 sq. ft. rental floor area above first floor.	Number of minutes during the day when lift capacity will be insufficient.
7	84
7.5	56
8	33
8.5	14
9	5
9.5	1

Assuming that a lift capacity of 9.6 persons per hour per 1,000 sq. ft. of rental floor area above the first floor in the class of building specified were allowed, and taking the New York allowance of 65 to 100 sq. ft. of rental floor space per inhabitant—say 82.5 sq. ft.—the lift capacity arrived at would allow for emptying the building above the first floor in 1 hr. 15 min., a figure which differed altogether from those arrived at by American authorities and by Mr. Day, but which was, he believed, when applied to buildings in the City of London, a more accurate one.

In order, then, to discover the lift capacity in such a building, the following formula might be used:—

$$\frac{9.6A}{NL}$$

where A = thousands of sq. ft. rental floor area the first floor;
N = number of circular trips, including stoppages, which could be made per lift per hour; and
L = number of lifts.

Having discovered the total lift capacity required, it was next necessary to decide the number of lifts to be employed and their speed.

As about 30 seconds represented the limit of patience to be expected of the average city man waiting for a lift, a building could not be considered to be adequately served when the occupants or visitors were asked to wait longer. To calculate the number of lifts required to handle a given traffic and give a half-minute service, the overall speed of the lifts—allowing for all stoppages—must be known. The number of stoppages a lift might be required to make in the course of a return journey from the ground floor and back again varied considerably, but in the class of building considered it was found to average about one stop for every 42 ft. of running. Allowing 12 seconds per stop for loss in acceleration, deceleration, opening and closing of gates and for the time taken by the passengers in entering and leaving the car, together with a further allowance to cover

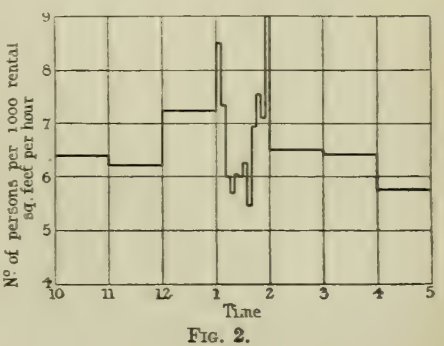

Fig. 2.

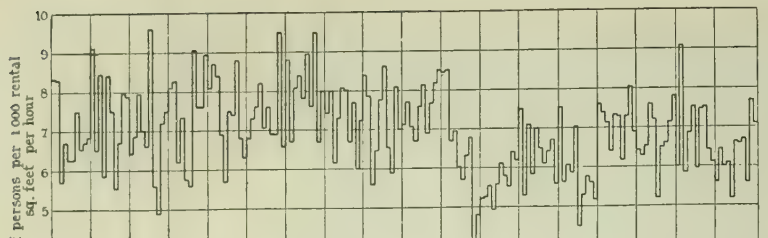

FIG. 3.

general loss of time, the overall time in seconds required for the circular trip would be :—

$$\frac{60 \times 2T}{R} \times \frac{2T \times 12}{42}$$

where R = running speed of lift in ft. per min.,
T = total travel of lift in feet in one direction.

In the case of a lift with 100 ft. travel and a running speed of 200 ft. per min., the overall time for the circular journey would be 117 seconds. In such a city office building two lifts of given capacity might not provide the required service, whereas three would more than do so, but by slightly increasing the speed the two lifts would suffice.

He made an allowance of 12 seconds for stoppage and lost time in an all-round average service. This would only be found sufficient provided the car were not too large. If the capacity was more than 10 persons—including attendant—the time allowance and the total lift capacity must be increased accordingly. It must also be assumed that the lifts were suitably situated and designed with wide openings for the easy ingress and egress of passengers. Under such conditions the effect of running speed upon overall speed might be set out as in Table 2 for a lift of 100 ft. travel.

TABLE 2.

Running Speed.	Overall time per circular trip with 100 ft. travel.
ft. per min.	secs.
100	177
200	117
300	97
400	87
500	81
600	77

The saving in overall running time fell off as the running speed was increased, so there must come a point at which additional capital cost was not justified by the saving in time. In Table 3, approximate figures were given in order to indicate the relation of running speed to capital cost for a lift designed for a load of 10 persons.

TABLE 3.

Running speed.	Extra cost (approx.) of machinery and safety devices (July, 1923).
ft. per min.	£
60	—
100	25
200	75
400	150
500	190
600	200

The figures did not represent a large percentage upon the cost of a lift of the travel and capacity under consideration, and, when taken in conjunction with a consideration of the saving of rent and attendance, would generally work out in favour of the higher-speed lift.

In Fig. 4 were shown diagrammatically the methods of reeving more usually employed, in (*a*), (*b*), (*c*) and (*d*), the winding engine being indicated at the head of the well, and in (*e*), (*f*), (*g*) and (*h*) at the foot. The ideal arrangement was indicated in (*a*), in which the driving sheave spanned the distance between the suspension points of the car and counterweight. Arrangement (*b*) was not so satisfactory but might be necessitated by considerations of economy, because the smaller the diameter of the driving sheave the less expensive were the motor and gear, or because the distance between the car and counterweight centres was too great to be conveniently spanned by a single sheave, or in order to comply with the particular building plan. Arrangement (*c*)—sometimes termed the "full-wrap drive"—might be employed where the out-of-balance load was considerable and there was danger of rope slip on the driving sheave. It was possible with this method of reeving to employ U grooves instead of the usual V grooves on the driving sheave, thereby greatly reducing the wear on the ropes. With this arrangement the idler sheave might be so placed [as in (*b*)] as to act as a diverting sheave in cases where the driving sheave could not be designed to span the distance between the car and counterweight. Arrangement (*d*) showed an adaptation of reeving which might be applied to (*a*), (*b*) or (*c*), introducing a 2 : 1 reduction in car speed. This method and further extension of the same principle might be conveniently employed when very heavy loads had to be raised at low speed. It would be noticed that in this diagram was introduced for the first time an S or backward bend in the rope. Such bends should be avoided where possible as they were much more destructive than a series of bends in the same direction.

Diagrams (*e*), (*f*), (*g*) and (*h*) showed similar arrangements but with the winding engine at the foot of the well. In these arrangements the lengths of the ropes were greatly increased and S bends were introduced in every instance. The arrangements with diverting sheave shown in (*f*) was for some reason exceptionally destructive of the ropes.

Whatever system of reeving was employed, the larger the diameter of the sheaves used the longer would be the life of the ropes. In these diagrams only one rope was indicated, but it must be understood that in passenger lift practice from four to six or more ropes running side by side were employed.

In the concluding part of the paper the lecturer outlined a number of experiments had made on the effect of various forms of for lift acceleration on the passenger.

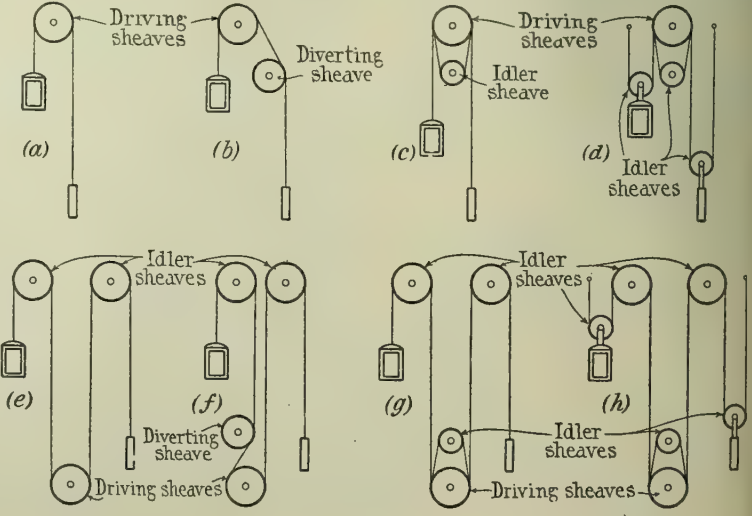

FIG. 4.

Trade Facilities Bill.

During the Committee stage of the Trade Facilities Bill, Mr. Sunlight moved an amendment to provide that State guarantees in regard to loans under the Bill might be granted on an undertaking of a co-operative society or trade union to advance deposits for house purchase for its members. He said that so long as the Nation's credit was to be used to encourage employment at home, he saw no reason why certain of the credits might not be earmarked to finance our own workpeople to enable them to obtain the deposit money with which to purchase their own houses. He considered that the organisation of trade unions and co-operative societies provided the machinery by which working people could be assisted to purchase their houses. He urged the amendment as a possible solution of the housing problem and he suggested that a credit of £10,000,000 should be ear-marked for the advancing of deposit money to those who desired to buy their houses. By these means he contended that in a very short time we should have £100,000,000 worth of houses being built.

The Government, however, were unable to accept the amendment, which was negatived.

Cost of Bricks.

In the House of Commons, Mr. Palin asked the Minister of Health whether he was aware that in South Yorkshire the cost of bricks had increased during the last few weeks by 10s. per thousand, one increase of 5s. about six weeks ago and another of 5s. last week, and that the cost of lime had also increased by 3 per ton; and whether he would take steps to prevent these continual increases in the cost of building materials.

Mr. Wheatley said he was aware that in certain parts of Yorkshire increases had taken place in the price of bricks, though he could not without further inquiry, accept the figures in the question as accurate. He was not aware that there had been any general increase in cost of lime, although he was informed that there were instances of increase in price in certain parts of Yorkshire. Such increases in prices as had been recorded were at present being investigated by the Committee on Prices of Building Materials and the question of any further steps that might be necessary to prevent increases in cost of building materials would be dealt with in connection with the Government's housing proposals.

THE BUILDING TRADES EXHIBITION

CEMENT CONGRESS

A NUMBER of papers on the manufacture and of cement were read at a Congress arranged Olympia this week by the Institution of ictural Engineers, and from those of more ortance to our readers we take the following :

ctural Steelwork reinforced with Concrete.

Ir. Ewart S. Andrews, B.Sc., A.M.Inst.C.E., paper on this subject, said in recent years ctural steelwork and reinforced concrete progressed upon somewhat parallel lines, comparatively little had been done in bining the two methods of construction. s was probably due to the fact that the two hods of construction had been regarded as petitors, and the specialists in each of the hods had concentrated upon demonstrating advantages of the one compared with those he other

n actual practice with structural steelwork steel was very often encased in concrete to ease its fire-resisting properties and to imise the dangers resulting from rusting. h encased steelwork was, however, almost riably designed so as to be capable of carry- the loading without any allowance whatever the additional strength of the steelwork due ts casing of concrete.

rom the results of experimental investiga- s which were already available it was e clear that the strength of structural steel- k could be increased very considerably by ns of the concrete casing, and it would ear that considerable advantages in practice d be obtained by combining structural lwork with concrete casing in such a manner the strengthening effect of the concrete n the steel could be allowed for in the design advantage still be taken of the protective lities of the concrete

lthough the proposed method of con- cting by means of comparatively light ctural steelwork encased in concrete had been developed to any very large extent e would appear to be several advantages e derived from its adoption. In the first e the light structural steel members could made strong enough to support the dead ght of the structure and the necessary ering so that erection could proceed very h more quickly than in the case of ordinary forced concrete work, because it was no er necessary to wait for the concrete to set re proceeding with the next stage. Con- rable economies could also be effected in centering because the concreting need not eed quite so quickly, and the dangers attend- upon striking centering comparatively kly would be minimised.

caling first with the question of columns, a amount of test results were already available. ne set of tests, columns built up of angle at four corners connected together by onal bracing and by batten plates were d both plain and filled with concrete, and est results showed that at three months illed columns were between 50 and 60 per stronger than the plain steel columns.

another series of tests carried out in the ersity of Illinois on the built-up section oyed in the United States, and known as Gray " column, consisting of four pairs of s back to back with batten plates between at 16 in. centres, tests were made for the columns and for various forms of concrete s. Here again the increase in strength was considerable, and was approximately 40 ent. increase in the case in which the con- just filled in the spaces between the steel.

ts were also made upon columns of the form which were (*a*) provided with a plain oofing external casing 2 in. thick, (*b*) pro- with a fireproof external casing 2 in. thick wire spiralled around the steel section.

plain fireproofed columns failed at a load almost exactly 50 per cent. that at which the plain steel columns failed.

In the spirally-reinforced columns two types were tested, in one of which the spiral reinforcement was 0.75 per cent., the spiral reinforcement in the other being 1 per cent. These were taken up to the full loading capacity without failure, although two of those with 0.75 per cent. spiral failure were considered to be near failure at a load just about double that at which the plain steel column failed.

The authors of the paper describing these tests stated among their conclusions that: " A basis for design which seems rational is to determine the strength of the steel column by the use of the column formula for the slenderness ratio of the steel columns, and then to consider the concrete of the core section (without reference to the length of the column for any length ratio, say a length of 15 diameters) to have a stress value proportional to the strength of the plain concrete, say, two-thirds of the cube strength. A suitable factor of safety would, of course, be somewhere applied."

These tests were made at 60 days, and at the end of six months the strength of the encased columns would clearly have increased considerably further with the increased strength of the concrete.

From these figures it was clear that a considerable increase in strength of a structural steel column might be expected to accrue from the fireproof casing with which it was surrounded, and that it would be worth while to pursue the subject farther to analyse additional test results that might be available with a view to arriving at a rational basis for practical design.

Coming to the question of beams it would be found that considerable increase in strength was given by the concrete casing. It had been the practice for some time of some designers to design the beams of an ordinary filler beam concrete floor upon a working stress of 10 tons per sq. in. in place of 7.5 tons per sq. in. as employed in ordinary design; others had followed the practice of designing filler beam floors by means of the formulæ resulting from the theory of reinforced concrete beams in which the area of the reinforcement was relatively high.

The results had recently become available of some extremely valuable tests made by Professors McKay, Gillespie and Lelnan for the Steel Fabricators' Section of the Canadian Manufacturers' Association, upon the strength of steel beams encased in concrete.

In these tests 10 in. steel beams 16 ft. long and 5 ft. apart were first tested plain by loading them and measuring the stresses in the flanges by means of extensometers. The first load placed upon the beams was the load equal to the dead weight of the concrete floor system and casing which it was intended later to cast between and around the steel beams. The next load was that calculated to produce a maximum stress of 16,000 lb. per sq. in. in the steel and corresponded to the combined dead and superimposed load for which the floor was designed. This designed load was 185 lb. per sq. ft. of floor area, and the test results for the plain steel agreed extremely well with the results obtained from the ordinary beam theory. A reinforced concrete floor slab of 1 : 2 : 4 concrete was then cast on the beams together with a casing of usual proportions, and after the concrete had set fresh values were taken of the stresses in the flanges of the beams. The stress in this case was bound to be in almost exact agreement with the stress previously found for the same load, and one could infer from this the interesting fact that with this form of construction there would be no compression stress in the concrete itself in the direction of the beams due to its own weight, the explanation apparently being that the resultant deflection occurred before the concrete had set and was entirely taken up in the beam.

Tests were then made to find the stresses in the beam for various superimposed loads placed upon the floor, and it was found that for the designed load of 185 lb. per sq. ft. this stress in the beam was only 9,530 lb. per sq. in. instead of 16,000 lb. per sq. in., and that in order to produce a stress in the steel of 16,000 lb. per sq. in. the inclusive load per sq. ft. had to be increased to 330 lb. per sq. ft.

This meant that the encased beam was 80 per cent. stronger than its calculated value to produce the working stress. The tests were not continued to destruction in either case, but he had no doubt that if they had been, the comparative strengths at the ultimate load would have been very much the same as that at the safe working stress.

A calculation based upon treating the combined section as a reinforced concrete T-beam with a large section reinforcement gave a result almost midway between the design value for the ordinary steel beam and the value found in these tests. From this it followed that the ordinary assumption that the concrete contributed nothing to the resistance of tensile stresses was one that erred on the safe side.

A consideration of the results both for columns and beams indicated that the concrete casing had an important strengthening effect upon the steelwork, and that they might look for considerable economy in design by a combination of ordinary structural steelwork with concrete.

The age of the concrete at the date at which the tests were made was 23 days only, and there was every reason to believe that the construction would increase considerably in strength beyond the above amounts with increase in time.

He believed that there were great possibilities for improved construction to be obtained by a combination of structural steelwork with reinforced concrete, and that the present position in which structural steelwork was regarded as a rival of reinforced concrete was one which did not result in obtaining the most scientific combination of steel and concrete for constructional work.

Uniformity in Concrete.

In a paper entitled " The 'Modulus' of Density of Concrete as a Means of Maintaining Uniformity throughout," Mr. A. S. Grunspan, B.Sc., A.C.G.I., A.M.Inst.C.E., said the question of density when relating to concrete for all purposes, and particularly when the concrete was to withstand a hydrostatic pressure, was all important to the engineer, and hence it was no wonder that he was tempted to administer " patent medicines " to the concrete when he had doubts as regarded its " bodily fitness." In order to procure good and dense concrete it was essential to pay attention to the degree of cleanliness of the aggregates, their grading, the chemical and mechanical properties of the cement, the mixing of the aggregates with the cement, and last, but not least, the amount of water to produce complete binding.

No matter how good a concrete might be obtained by the exercise of the above mentioned measures, one often heard that still better results would be achieved by the use of such and such an admixture, of which there appeared to be plenty on the market, and the bulk of which, by the way, left him very cold.

It appeared to him that from the known percentage of voids in the coarse material, sand, cement and the known amount of water used, a function termed the modulus of density of the concrete could be derived. This function would give an insight into the concrete's closeness of texture, and should enable them to adjust a mixture analytically rather than empirically.

It was generally assumed that the sand was so specified as to fill the voids of the coarse

material chosen for the work. and the binder (cement plus water) filled the voids of the cement. If, therefore, they began with known materials containing a known percentage of voids, and finished with a conglomerate in which the binder had a well-defined volume, the ratio of the volume of binding material (*i.e.*, the granular volume or the volume of the cement free from voids plus the volume of water) to the volume of voids which the binder had to fill, should give an insight into the density of the concrete, and that ratio he called the modulus of density.

It appeared that the density modulus was directly proportional to the amount of cementitious material used in a given mixture and inversely proportional to the percentage of voids in the coarse material, and consequently the percentage of voids in the sand.

It should not be misunderstood that by increasing the amount of water the amount of cementitious material and thereby the density modulus would be increased. The amount of water to be used was better understood nowadays, and no one with any knowledge of concrete would use more water than could possibly be helped. It remained, therefore, either to increase the amount of cement or choose an aggregate possessing a smaller percentage of voids; the latter, if at all possible, was to be preferred, for too fat a concrete was attended by many risks which it was advisable to avoid.

Engineers in the past used lime as an admixture to the cement in order to obtain a denser concrete. To some extent that practice was still being followed. The addition of lime, however, meant a reduction in the strength of the concrete, and could not on that score be always recommended. It was consequently very important that the nature and property of an admixture singly and in association with the cement be carefully studied by an expert before its use was decided upon.

The properties to be looked for after being satisfied that the admixture was free from elements likely to react adversely on the concrete, was the capacity to fix the calcium hydroxide, liberated from free lime which the cement or even the aggregates contain when the cement hydrated on setting.

The calcium hydroxide, particularly in concretes exposed to sea action, or when under the action of highly volatile spirits and light oils, was a source of weakness, and any "reagent" which was likely to absorb it was worthy of consideration.

It was known that if an active siliceous material were added to the cement it combined with the free lime, and produced a cementitious material instead of calcium hydroxide. Tests had been carried out on concrete in which trass had been embodied with good results.

It seemed to be quite common practice when specifying a mixture for a given concrete to stipulate that the sand and aggregate be well graded, without any reference as to the maximum percentage of voids the aggregate was to contain. It was obviously wrong to specify a mixture before the aggregates were settled on and chosen. The most obvious thing to do was to determine as accurately as possible the percentage of voids of the sand and coarse material each time a fresh consignment reached the work. From the specified mixture it could then be ascertained whether or not the mixture gave the same density modulus and the specifications varied accordingly.

Setting Time of Portland Cement.

"Some Disturbing Factors in Cement Setting" was the title of a paper by Mr. H. K. G. Bamber, who said in the course of his experience in the cement industry he had found that the factor in the use of cement least understood, and productive of the most difficulty, and sometimes disappointment, to the user, was the property which cement possessed—in combination with water—of consolidating itself into a permanent rock-like mass, enlocking in the process any materials with which it was in contact and which was not chemically repellent.

It should be obvious to all users of cement that the time limits of this process of consolidation, generally known as "setting," must be outside the time limit required for the sum of the mechanical operations employed for properly mixing the cement and water with the aggregates to be used, and placing the resultant plastic mass into its required station, otherwise the crystallisation constituting the setting would be interfered with or perhaps destroyed.

In the preparation of concrete the fact should never be overlooked that the binding material, *i.e.*, Portland cement, before use, in its dry state, was chemically active and in a state of unequilibrium until the requisite quantity of water was added and absorbed to encourage the chemical changes and combinations with establishment of equilibrium resulting in setting, the progressive processes of which must not be disturbed.

Much of the trouble which arose from time to time in the hands of some consumers in connection with the use of this material was the result of the failure to appreciate that Portland cement although in itself a completely manufactured material, was really in its dry condition, as sold, an unstable chemical compound always seeking to satisfy itself by absorption with water, which it proceeded to do with the greatest avidity as and when opportunity accidentally or intentionally was afforded. Unless cement possessed this property it could not fulfil the purpose of its creation, and, therefore, its power to act in such manner must not be judged to its detriment.

He had known a case where an aggregate which appeared under ordinary examination to be suitable in all respects, turned out to be useless with one high-grade Portland cement, and satisfactory with another; both being well-known brands of the highest quality, testing far in excess of the British Standard Specification requirements. Chemical and physical examination failed to detect the disturbing element which, while permitting one cement to set satisfactorily, absolutely destroyed the setting properties of the other, a change of aggregate resulting in both cements being satisfactory. Such an experience is an indication to the engineer of the importance of thorough investigation into the character of concrete aggregates proposed to be used before actual work was commenced. It was always advisable to test the aggregates to be employed especially if not obtained from recognised and approved sources, with the brand of cement intended to be used.

At all times the best results were likely to be obtained by the use of slow setting cement. It was a fallacy to suppose that greater strength was obtained at early dates by the use of moderately quick setting cements, which were always more liable to be injured if the work were not carried out with the greatest expedition. The greatest safeguard the engineer possessed was to obtain slow-setting cement from absolutely reliable sources, and, when it came into his possession or under his supervision, to protect it with all reasonable care against atmospheric influences, regulating constructional operations so that the time taken for their complete performance was not extended beyond the time when the cement commenced to set, which might vary from day to day, depending upon the temperature and hygroscopic condition of the atmosphere.

Portland Cement in Sea Water.

Mr F. E. Wentworth-Sheilds, O.B.E., M.Inst.C E., speaking on "Portland Cement in Sea Water," said the experts who had studied the question of how to prevent the decomposition of cement concrete and mortars by sea-water might be roughly divided into two opposite camps, namely, those who had sought to protect the cement by altering its chemical composition or adding material which should affect the chemical actions involved, and, on the other hand, those who had sought to protect the concrete by preventing the admission of the sea-water into the bulk of the material; in other words, by making it highly impermeable.

As regarded the chemical school, the earliest and perhaps the most famous was the great French chemist Vicat, although a very large amount of valuable research had been carried out since his time, particularly in France and Germany. Vicat first explained the chemical action of sea-water on cement and laid down rules for its composition in order to secure it stability. He pointed out that lime was th most vulnerable ingredient in cement, and tha there should be only a sufficient quantity presen to combine with the other salts. Since his tim many attempts had been made to vary th ingredients so as to produce a cement whic would be more permanent. It seemed to b generally assumed to-day that cement whic complied with the standard specifications o Great Britain and other countries was suitabl for use in sea-water, but this view was some times contested.

Several materials had been suggested a additions to Portland cement for the purpose o increasing its chemical stability in sea-wate Of those by far the best known and most used i pozzolana or trass, which was much favoure by harbour engineers in Europe. It had not bee very popular in Great Britain, although Smeato used it in conjunction with lime to make hi mortar for the Eddystone Lighthouse in 175 Apparently its virtue consisted in the fact tha it combined with the lime which is freed durin the process of setting of Portland cement, an thus prevented the formation of the dangerou sulphate of lime. Although trass occurred i many different places, it was by no means a equally suitable for this purpose.

There were a large number of experts wh considered that modern Portland cement, woul make a concrete which was very durable in sea water, provided the concrete be made in suc a way as to offer a high resistance to the passag of the water into its mass. If the concrete w highly impermeable it was claimed that wh little sea-water penetrated could do no har as the solid products of the chemical action i volved tend to choke up the pores of the co crete and make it the more impermeab Whereas in the case of a porous concrete t products got washed out leaving fresh surfac to be attacked by a fresh supply of sea-wat

It was well to bear in mind that there was such thing as an absolutely impermeable co crete. All one could hope to do was to redu the size and proportion of voids, and thus to ma the resistance to the passage of sea-water great as possible. We had, however, at lea certain conclusions on the matter. First th mixture must be rich in cement. Any concre containing mortar poorer than 1.2 was like to be useless in cases where sea-action w feared. The stones and sand should be w graded, *i.e.*, they should vary in size fr coarse to fine, and at all costs a large proporti of fine sand was to be avoided. The concr should be well mixed by a good machine. T proportion of water should be carefully det mined as either an excess or defect of wa when gauging was liable to produce por concrete. Pouring concrete under water sho be avoided, as concrete moulded in this way v of doubtful quality and very permeable.

It had been suggested that denser concre would be produced by the use of special cemen but he had met with no experiments which conclusive on this point. Again, many terials were on the market for which it claimed that if mixed with concrete or mo they greatly decreased its permeability. elaborate investigation was made into a num of such materials by the American Bureau Standards in 1911. It tended to show that addition of such materials was of little us the case of rich mixtures, and that some of t decreased the strength of the mortar.

They still wanted a really good test for permeability. Several methods had been u such as determining the actual volume materials used in a cubic unit of concrete, hence the proportion of voids, or again measu the quantity of water which could be fo into or through a slab of known dimensio a unit of time. But these methods were and did not tell exactly what was wanted. they could test for permeability as easil they could test for strength and compare test with a standard, it would not be before they should be able to use va materials to make a concrete which would the greatest possible resistance to the destru action of sea-water.

THE ARCHITECTS' AND SURVEYORS' ASSISTANTS' PROFESSIONAL UNION

A CONVENTION of delegates of the Architects' nd Surveyors' Assistants' Professional Union as held at the Building Exhibition, Olympia, April 19 and 21. Mr. J. W. Denington, .R.I.B.A., President of the Architects' and urveyors' Assistants' Professional Union, esided.

The following resolution was passed at the pening of the first session :—

"That this National Convention of delegates pproves of the Executive Council's action in tting up a benevolent fund for the benefit of embers as laid down in the rules governing that nd; further, that it calls upon all branches, at e discretion of their committees, to devote rofits from social events to this fund" for e purpose of founding a benevolent fund r architects' and surveyors' and builders' chnical assistants.

The General Secretary, Mr. John Mitchell, id existing funds, with one notable exception, ere useless so far as the general assistant in the rofessions was concerned. Instead of being a nd which waited until desperate application n the part of those entitled to its help was ecessary, as was so common amongst benevo- nt funds, he hoped that this fund would go rward with its good work in the homes and ves of assistants in needy circumstances, and eize every opportunity to prosecute the good ork for which it was intended. Its objects are unique: besides including for the ordinary ontingencies of accident, distress, illness or dden emergency, grants to widows and rphans, the endowments and maintenance of st homes for members and the securing of enefits from sanatoria and convalescent homes nd similar institutions, it proposed to grant emporary loans to assist the younger members following up the professions. It was difficult to stimate how many young architects and sur- eyors had been prevented from attaining the ll maturity of their activities through the lack capital to buy books and materials for tudy. Membership of the fund was divided nto "donors" and "life members," and every ember of the Union was entitled to relief from he fund. Before any public action had been aken the sum of about £200 had already been ollected; one member of the Union had given 100.

An important report was presented by the Executive Council of the Union dealing with the vercrowding and educational facilities preva- nt in the architectural and surveying profes- ons. Its chief points dealt with the large umbers of young men entering these professions. n Aberdeen and Glasgow it was found from tatistics that there was an excess of learners ver requirements of 335 per cent. and 416 per ent. respectively. Throughout the country it as found that the pupil system, although oribund in London and Liverpool, exceeded he training undertaken by schools by 5 to 1. n a large town in S.W. England 22 architects ere engaged as principals; there were 15 paid ssistants and 16 premium-paying pupils. No tatistics dealing with this side of professional mployment had previously been obtained. he report also pointed out that from the formation supplied the schools must be garded as a source of overcrowding equally ith the apprenticeship system. It urged that greater control over the evening classes should e obtained by the professional institutes. nother disturbing factor was the very large umber of men who have entered the professions ithout any training whatsoever. In the archi- ctural profession the percentage was approxi- ately 11.8 and in the surveying profession bout 1.6 per cent. The report suggested that practical way out of the difficulty would be by he construction of joint boards throughout the ountry with representatives of the Royal nstitute of British Architects, the Allied ocieties and the Surveyors' Institution, &c., nd the Architects' and Surveyors' Assistants' Professional Union. The Convention approved of the report in its entirety.

A motion was passed which approved of the alteration of the rules of the Union to include for a Provident Section. This would guarantee to members £1 per week per share during a period of unemployment and £1 per week per share during sickness. At the end of each year the surplus remaining in the fund would be distributed equally between all members in proportion to their holding. These provisions would mean much to the assistant of to-day who seldom remained in a position for any long period owing to the type of work and employ- ment. He was sometimes confronted with a short spell of unemployment between the termination of one situation and his obtaining another.

The National Convention instructed the Executive Council to proceed with the setting-up of divisional councils all over England and Wales and similar in character to those at present in existence in Scotland. Those councils to consist of delegates representing the branches in their area and to advise the Executive Council of the best means of forwarding the work of the Union and furthering the interests of assistants in their division.

The following motion was passed relative to the Joint Committee set up by the Union and the R.I.B.A. to thoroughly explore the questions of overcrowding in the professions, the principle of minimum salaries for assistants and the direct representation of the Union on the Council of the R.I.B.A. :—

"That this National Convention of delegates notes with satisfaction the assurance given to the Union that in any future steps taken by the Council of the R.I.B.A. the views of the Union will receive careful consideration, further that it approves of the pledges given the Union by that Council that joint inquiries will be made into the questions of overcrowding, minimum salaries, and direct representation of the Union on the R.I.B.A. Council, and re-affirms its strong belief that only by the satisfactory settlement of these questions can the future well-being of the profession be assured."

Owing to the great outcry by all classes of professional assistants who were members of learned institutions and who were not allowed to deduct (under Schedule E) the subscriptions paid thereto from their income-tax assessments unless this payment was an indispensable condition of their employment, the grievance being that such proof of its necessity was not required by employers (under Schedule D).

"That this National Convention of delegates strongly protests to the Chancellor of the Exchequer against the ruling of the Board of Inland Revenue that employees who are members of learned Institutions cannot deduct (under Schedule E) subscriptions paid thereto from their income-tax assessments unless as an indispensable condition of the tenure of their employment as employers assessed under Schedule D and demands that steps be taken to remove this disqualification on the employee and such amendment to the law as may be necessary to this end be introduced immediately into the House of Commons."

The resolution it was hoped would draw the attention of the Government to an instance which certainly ought to be remedied, there being no justification for its adoption in the one case and its retention in the other.

A further motion on income-tax was proposed by the Manchester Branch and the Executive Council, and was carried unanimously :—

"That representations be made to the Chancellor of the Exchequer with a view to obtaining a rebate off the income-tax for subscriptions paid to the Union and an allowance for the provision of technical books and the maintenance of instruments."

The following motion regarding minimum salaries was carried :—

"That this National Convention of delegates approves of the action of the Executive Council, on December 31, 1922, in amending the scales of basic minimum salaries, and approves those stated in the pamphlet circulated and appended to this resolution" :—

Minimum Salaries.

(Figures based on the Cost of Living at December 31, 1922.)

19 years of age and over .. £3 8s. 0d. per week.
26 years of age and over .. £5 11s. 0d. per week.

The Union has decided that the salaries of all professional and technical assistants covered within its membership should be computed from the following July 1914 basis, viz. : £2 per week at 19 years of age, £3 10s. per week at 26 years of age. To these is to be added temporary increment according to the Civil Service Award at

"The Builder" Stand at Olympia.

present operating, viz.: 130 per cent. on the first £91 5s. per annum, 60 per cent. on the next £108 15s. per annum, *less* 1-26th of the total temporary increment for every five points fall in the Board of Trade index of the cost of living below 130 per cent. above the July 1914 standard; thus, if the cost of living is 80 per cent. above that of July 1914, 10-26ths of the total temporary increment is to be deducted. Richer experience, unusual talent and higher office responsibility, however, entitle their owner to equivalent extra remuneration. This should in all cases be computed and added to the above minima, which only represent the ordinary grades of service and are in no case meant or desired to fix a standard. Any doubt as to the precise assessment of a member's salary under this heading should be followed by an inquiry to the General Secretary of the Union. The co-operation of all members is invited to establish and maintain these scales.

A motion of the Manchester Branch that the Union should take immediate steps to affiliate to the National Federation of Building Trades Operatives was fully discussed and was lost by 275 votes to 75.

The Executive Council was instructed to enter into negotiations with the National Federation of Building Trades Employers, the Royal Institute of British Architects, the Society of Architects, and similar associations to secure recognition of the Union's scale of wages—this was carried unanimously.

Motions for the automatic expulsion of members from the Union and the paying of an entrance fee of £2 to be paid by members joining for the first time and members rejoining were withdrawn in view of the opposition of the Executive Council.

The Convention further instructed the Executive Council to consider the advisability of obtaining the services of a full time organiser for furthering the interests of the Union.

PLAYS AND PLAYHOUSES.

A lecture was given under the auspices of the Architects' and Surveyors' Assistants' Professional Union at the Building Exhibition on April 14 by Miss Amelia Defries and Mr. T. P. Bennett, F.R.I.B.A., Head of the architectural department, Northern Polytechnic, London, on "Plays and Playhouses."

Miss Defries having dealt with the question of a National Theatre, Mr. Bennett, speaking from the architect's point of view, said that the problem of the theatre was one of the greatest antiquity. If one inquired into the subject it would be found that in the Byzantine period of architecture mosaics were designed and shown publicly for the education of the people, and that in mediæval times the theatre might be said to resemble one of their modern halls in an incompleted state. So far as the problem of the auditorium was concerned it was easy to understand. The three primary considerations were that the audience should see the stage clearly, hear well, and should have adequate seating accommodation. One of the most difficult problems confronting the architect was the question of the sides, where the audience heard, although hearing better they saw less, whilst those directly in front of the stage saw more and heard less. This brought them to the subject of acoustics and upon this particular subject there was no actual formula which could be worked upon and adhered to by the architect. For instance, the scenery absorbed the acoustics, and therefore various types of scenery meant various degrees of acoustics; again the movements of air and temperature affected them. There was little doubt that a great amount of research work was required upon this all-important subject in order that they might have definite and clearly understood views which would give dependable results. The two general dangers to be contended with in arranging the materials used in the interior were those of absorption and echo, and it was interesting to note the effect which could be arranged for their judicious selection. The following list gave various materials ranging from hard and resilient to soft:—Marble, hard plaster, plaster, wood, silk, and then again to the hard material of heavy tapestries.

The decoration of theatres could very well start with the stage opening and it was as well to point out that very few architects seized the chance of framing the opening in a suitable manner. One of the troubles to be contended with in giving attention to decorations was the bulky arrangements necessary to provide for the constant supply of fresh air and ventilation. One interesting problem which had been more or less satisfactorily solved was that of fireproofing the building. In order to make the auditorium as fireproof as possible the stage roof was made inflammable in order to permit of the fire spreading to the stage roof.

The building of the theatre was, Mr. Bennett concluded, to his mind, one of the most important and interesting tasks which could fall to the lot of an architect.

Mr. Chas. McLachlan thanked the lecturers for their most interesting contribution on this subject.

"OLD WESTMINSTER" & ITS HISTORIC BUILDINGS

THE second of two lantern lectures was given this week by Mr. Herbert A. Cox, F.C.A., at the Building Exhibition on the historic buildings of the Palace of Westminster descriptive of those which have disappeared and also of those remaining. On the panorama views showing the precincts of the Abbey in the sixteenth century, attention was called to the west gate, built by Edward III, in which was the Almonry; it was in this gateway that Caxton set up the first printing press in England in 1482, and later when it was a prison the royalist Lovelace there wrote when confined:—

> "Stone walls do not a prison make,
> Nor iron bars a cage;
> Minds innocent and quiet take
> That for an hermitage."

The principal buildings of the Palace, viz., Prince's Chamber, Old Parliament Chamber (House of Lords), Painted Chamber, Court of Requests (House of Lords, 1823-34), St. Stephen's Chapel and College of St. Stephen's were briefly described, having been dealt with in detail at the first lecture. The origin of the fire of 1834 was narrated and a specimen of a wooden tally shown. It was explained that the tally system having been discontinued in 1826, an order for the destruction of the vast accumulation of tallies led to the outbreak of the fire which consumed the chambers used by both the Upper House and the Commons. Views were shown of the ruins of St. Stephen's Hall and the Cloisters, together with the restoration of the latter.

Westminster Hall was illustrated by several photos and drawings which have appeared in *The Builder* with descriptive articles on the restoration of the roof (see January 5 and November 16, 1923). Two views were also shown (1) of the north side with the flanking towers and magnificent porch built by Richard II (the time was before the restoration of 1820) and (2) of the west side in 1882, when the old Exchequer buildings were cleared away (on the opening of the new Law Courts) revealing the six buttresses erected by Richard II, but now almost entirely hidden by modern offices (see photograph on this page). Illustrations depicting historic scenes, which took place in Westminster Hall, were also given.

Architects at the Building Exhibition.

At the Building Exhibition several hundred members of the Royal Institute of British Architects, the Architectural Association, and the Society of Architects met last week to inspect the exhibits.

Waterproof Sandpaper.

The sole British concessionaires of "Wetordry" waterproof sandpaper, Messrs. R. W. Greeff & Co., Ltd., state that this material is making rapid strides amongst all classes of painters and decorators who have been quick to realise and appreciate its advantages. Careful experiments made by a large number of users of the now well-known "Wetordry" brand of waterproof sandpaper under widely varying conditions show invariably a considerable saving both in material and labour over dry rubbing down with ordinary sandpaper. It has been proved that the breathing of dust is one of the chief causes of sickness among painters. This can be avoided by rubbing down wet. "Wetordry" waterproof sandpaper is a material which can be used on any kind of job. The point in regard to ease of working is that rubbing down wet, the sandpaper cuts the surface with a minimum of effort; all attention can be given to getting a good finish without undue fatigue. Also the water reduces scratching. "Wetordry" can be rinsed in water from time to time to remove accumulated paint and thus be used over and over again. It lasts, it is claimed, eight times as long as dry sandpaper

Westminster Hall, West View.

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

R. WHEATLEY, in making his promised ement on housing, said that the broad lts under the 1923 Act up to April 1 were ollows:—For the eight months in which the had been in operation 8,140 houses had been pleted, 30,405 houses were under construc-, while the contracts made or certificates ed by local authorities covered a further 46 houses. Of the 38,545 houses which had n completed or were in course of construction, e than half he had reason to believe were to or sale. It was well to bear in mind that if verage annual output of probably 100,000 ses was required to meet the normal increase opulation and the annual depreciation of ses of a similar kind, when the output was w that number the accumulated shortage not being reduced.

he Government had received an extraordi-ly valuable report, and he desired to express thanks of the Government to all those in industry who spent so much time and skill framing an industrial policy to meet the ional needs. The main point to be noted in report was that the industry had come to conclusion that, on the basis of a long-term gramme of house-building, it could secure n an augmentation of the building labour of country as would ensure a production of ses which would go far to meet the essential ds of not only keeping pace with the normal and, but of making good the present shortage l doing something effective to get rid of slum ditions. Without pledging themselves to the ails of all the recommendations in the report, Government were prepared to accept the nciple of a long programme, and were hopeful t this would command the support of all ties in the House. The representatives of building industry authorised him to state t they would be prepared to attend non-party tings or party meetings of the House rested in housing and explain the report and wer questions.

bad been a fixed principle of all recent slation in aiming at a solution of the housing blem that the matter should be tackled on basis of a partnership between the Govern-t and the local authorities. Accordingly, oon as the industry was in a position to rt as to what was practicable, he summoned nference of the local authorities' associations reat Britain. He met their representatives April 15, and explained to them the prin-es which it seemed necessary to observe. se he might sum up as follows:—The pro-on of houses in numbers sufficient to meet needs he had described; the adoption of a programme as a means of securing the ssary augmentation of the resources of the ding industry; the provision of houses for ng at rents within the capacity of the ers. The local authorities undertook to a Committee to consider these principles to go into the necessary financial arrange-s. He hoped to conclude the negotiations on as possible after the recess and to lay e the House the complete proposal.

Empty Houses.

. Lorimer asked the Minister of Health had any information with reference to where houses were kept empty for the erate purpose of obtaining a high price hem.

. Wheatley said that representations had received from a number of local authorities g attention to the fact that unoccupied es were held for sale at enhanced prices, letailed statistics on this point were not able.

Dispossession of Tenants.

C. Cayzer asked the Minister whether he ware that some landlords were dispossessing ts on the assertion that they needed the s for personal occupation and then, when enants had left, were putting the struc-tures up for sale with vacant possession; and whether, seeing that this was absolutely opposed to the spirit of the law, he would, in the event of such cases being submitted to him, take steps to make such action illegal.

Mr. Wheatley said that provision was already made to meet cases of this kind. Under the existing Act the court could require the landlord to pay compensation to the tenant for loss or damage sustained if possession of a house was obtained by misrepresentation, and to direct that the house in question should not be decontrolled.

Bricklayers' Average Work.

Mr. E. Simon asked the Minister whether he was aware that, in the Report on a housing programme (Cmd. 2104), the estimate of the labour required was based on a bricklayer laying 300 bricks a day, whereas it had recently been estimated that the average number laid by each bricklayer in the Manchester housing contract was 600 daily; and was he prepared to recommend acceptance for 15 years of a scheme based on this output.

Mr. Wheatley said he was not aware that the estimate contained in the Report referred to was based on a bricklayer laying 300 bricks a day, and he did not know on what the hon. Member was basing his statement. He would, of course, be aware that a bricklayer performed other duties besides the actual laying of bricks.

A Newspaper Interview.

Sir K. Wood asked whether the statement of the Chancellor of the Exchequer contributed to an American paper on the financial arrangements of the housing scheme represented the Government's policy and programme.

Mr. Snowden said that the statement made by him to an American newspaper reported in British newspapers was based on declarations made in the House as to the estimated costs of houses and the rents. The deductions from those declarations as to the general lines of the scheme were obvious and depended on the cost of the houses and the rents at which they were let coming within the estimates indicated in the House and in relation to previous subsidies. The amount of the subsidy to be borne by the State and the local authorities was obviously a matter for discussion between the Government and the local authorities.

Houses Completed.

Mr. Wheatley informed Mr. E. Simon that the number of houses completed during the years 1921, 1922, and 1923 under the Housing, Town-Planning, &c., Act, 1919, were 68,255, 74,769 and 15,679 respectively. Under the Housing (Additional Powers) Act, 1919, 18,414 houses were completed in 1921, and 14,230 in 1922. Under the Housing &c., Act, 1923, 3,506 houses were completed during 1923. Information as to the number of houses erected without State assistance during the three years in question was not available, but according to returns obtained from local authorities in England and Wales as to building by private enterprise without assistance from public funds it was estimated that over 39,000 houses of not more than £26 rateable value in the provinces and £35 in the Metropolitan Police districts, were completed during the year ended September 30, 1923. Some of these houses were no doubt larger than those provided under the Act of 1923.

Evictions.

The Liberal Prevention of Eviction Bill has passed the Committee stage. The principal clause provides that the existence of alternative accommodation shall not be a condition of an order or judgment on any of the grounds specified in paragraph (d) section 4 of the Rent and Mortgage Interest Restrictions Act, 1923:—"Where the landlord, or the husband or wife of the landlord became landlord before July 31, 1923, and the dwelling-house is reasonably required by him for occupation as a residence for himself, and the Court is satisfied that, having regard to the alternative accommodation available for landlord and tenant respectively, greater hardship as regards conditions of living would be caused by refusing to grant an order or judgment for possession than by granting it."

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU

May we appeal to our correspondents to submit their queries on paper of a size easily filed, and written as legibly as possible, or better still, in typescript?—ED.

Glasgow Building Materials.

SIR,—I should be obliged with any information relating to the materials now used in Glasgow in the construction of (*a*) external walling (ashlar and dressings); (*b*) internal walls and partitions; (*c*) as to whether reliable facing and stock bricks are obtainable in the locality, and if they are at all likely to suit the climate or local taste if introduced into a building of any size in Glasgow or locality; and (*d*) prices generally, compared with London. J. H. H.

Asbestos Pantiling.

SIR,—Have any of your readers had experience of the use of asbestos pantiles? If so, I should be most glad to know whether they have found them satisfactory in use. I have a very excellent sample before me which should look very charming, but it appears very light, and one feels doubtful if such tiles would not be liable to lift in a high wind. The cost, however, is so low that it suggests a way of arriving at a very artistic finish to a cheap building.

ANXIOUS.

Houses in Blocks of Four.

SIR,—I notice that in blocks of four houses with a central passage way, some architects arrange the first floor party wall to stand over the centre of the passage way, while others plan the first floor interlocking, the party wall standing alternatively on one wall of the passage way or the other.

I should be interested to hear which method is considered the best and most economical, and no doubt some of your readers will be able to satisfy me upon the point.

HOUSING.

Gables to Pantiled Roofs.

SIR,—Can you inform me if it is possible to obtain right and left-hand pantiles without special making? If it is not possible, perhaps one of your readers with experience in this variety of tiling can advise me of the best treatment for the verges of a gable in a pantiled roof to avoid the one-sided appearance that would result if tiles all of one hand were used on both verges.

COTTAGE BUILDER.

Restoration of Old Cottages.

We have received a communication from a firm of manufacturers, stating that no one has, in reply to this query, suggested waterproof cement. They state defective damp courses are a common source of trouble, and the only way to cure, apart from cutting out for and inserting a new horizontal damp-proof course, is to strip off the plaster on the *inside* and give the wall a coat of cement mortar waterproofed with cement waterproofing powder. The room becomes dry as soon as the cement has set hard: no other method is so quick in effecting a cure. (When a horizontal damp course is inserted a long time elapses before the moisture left in the wall is drawn out by evaporation. Also it is expensive and there is a danger of settlement cracks.) When the cement is dry it is advisable to give a coat of absorptive limed plaster, because cement surfaces are more susceptible to condensation than plaster surfaces. If a cement finish is desired it is better to finish with a wood trowel (float) as condensation is less frequent upon a rough surface.

Fire Protection.

Mr. W. Daniel Smith, F.A.I., P.A.S.I., informs us that he is engaged in preparing a paper upon the subject of "Fire Protection in Building Construction," and would be glad if manufacturers of fire-resisting materials would send him particulars to 3, Castellain Mansions, Maida Vale, W.9.

THE BUILDING TRADE

LIME FOR CONSTRUCTIONAL PURPOSES

In comparison with other industries, the lime industry in this country must be classed as backward, both in its manufacture and application. Although isolated cases of recent improvements in the method of production are not absent, there are still kilns in operation which are not far removed in their construction from those in use centuries ago. So far as the use of lime is concerned it might almost be said that the present age is less efficient than its predecessors, because it is claimed that the excellence of some of the Roman mortars, made twenty centuries ago and still in existence, is due to the extreme care exercised in the slaking of the lime and the preparation of the mortar, and it can hardly be claimed that extreme care is exercised in these operations nowadays.

With the present system there is no opportunity for the testing of lime such as occurs in connection with cement and other materials, and consequently it is difficult to specify a standard of quality for lime. Consequently, the value of lime is judged largely by its appearance, and under this standard a consignment of lime that is composed of large lumps is generally regarded as acceptable, while lime in smaller pieces or in dust form is looked upon with suspicion. There is no sound basis for such a judgment, because there is no reason why the large lumps of lime should be any better for building purposes than small pieces or dust.

Then, again, as all lime for building purposes requires slaking before it can be used, the lime which slakes with the least trouble is usually more favoured than a slower slaking lime. Such a distinction is in opposition to the merits of the material, because a slow-slaking lime indicates an argillaceous lime (sometimes termed grey lime) which for many purposes is more advantageous that the rapid-slaking white lime or fat lime. In this connection the question arises why the builder takes upon himself the slaking of lime when this operation could be performed by the manufacturer with more satisfactory results.

There are thus two defects of the lime industry (namely, the absence of a standard of quality and the marketing of a material only partly manufactured, *i.e.*, unslaked lime) which are the cause of many unsatisfactory circumstances and could be remedied by one change, namely, the sale of slaked lime, otherwise known as hydrated lime. In the United States practically the whole of the lime used by the builders is sold in the slaked condition, and similarly in France. In the former case the bulk of the lime is white lime, while in France the lime of commerce is usually argillaceous or grey lime. In both cases the tonnage sold is many times greater than the British output of lime, and it is therefore reasonable to assume that this method of marketing lime does not restrict its use.

Slaked or hydrated lime is sold as a dry powder packed in sacks. Its slaking is performed under strictly regulated conditions with the correct amount of water, and with proper methods there is no risk of unslaked material liable to "blow" being produced. For the white lime as produced in America mechanical hydrators are in use, which, while designed to save labour, are also effective in producing a perfectly slaked material. For the hydrated grey lime as produced in France slaking cannot be completed during the few minutes while the material passes through a mechanical hydrator, and storage for periods up to three weeks is needed before hydration is complete.

When hydrated lime is used it is possible to impose a standard of quality which can be based upon chemical composition and upon strength, and the user can therefore, by taking the necessary steps, ensure that he is receiving a pure material and one with the qualities he desires. At the present time in this country, owing to the preference for lime in large pieces which, as already stated, is an unsound basis of judgment, manufacturers have to adopt methods of manufacture which are unnecessarily costly, but if the use of hydrated lime became general it would be possible to economise in manufacture, and the consumer should thus have the advantage not only in receiving a standardised material capable of being tested, but a material at a lower price. In addition the user of lime would be saved the tedious process of slaking and would be free from the risks of incomplete slaking which can now arise under the haphazard conditions which frequently apply.

REPORT OF THE BUILDING COMMITTEE

Mr. John E. Yerbury writes:—

The report of the Building Committee on the Provision of Houses will no doubt attract the attention and criticism it deserves.

With 15 years' absolute control as to when, how, where, and at what price building should be carried out; with complete control with regard to the numbers who shall enter the trades connected with building; will the spirit of altruism govern those with this vast authority, and will they always think first of the public and be content with the wages and profits of the present competitive system? I wonder! The building industry, already sheltered against foreign competition, importing hardly anything except timber, is to be protected against competition at home by a 15 years' guarantee from the State of a continuous definite programme to provide 2½ million houses. If this is done, and the numbers allowed to enter the industry are restricted, what a lovely hospital for slack times will be found for the then united employer and worker in the building industry, joined in brotherly confidence by the merchants and manufacturers engaged in production for their service. But what of other industries, not sheltered, without guarantees for 15 days. Parliament can sanction expenditure on 2½ million houses easily enough, but how will it control cost? Prices have gone up before the ink of the report is dry.

The report says "houses are being built to-day at the lowest possible cost." But this cannot be true. "The lowest possible cost" is the actual cost plus fair wages for good output, and a fair profit to all concerned with service. I went to the Building Exhibition and there I met and talked with "all sorts and conditions of men" interested directly—or, like myself, indirectly—in the trade. I wanted to hear why building costs were so high that I couldn't get more work; and most certainly am not convinced that houses are being built to-day as cheaply as possible. The manufacturer says that coal (so largely used in production of building material) prices are daylight robbery and the railway freight charges iniquitous. The merchant says he could not reduce his prices as he would like to because he was in the combine and prices were fixed. The builder said the output of the men could be increased without sweating by anything from 25 per cent. to 50 per cent. The worker said the employer's one thought was to lower wages and increase profits. While the client said he would not built at the price, and I wondered if I should in that event get paid at all for my time, trouble, and advice.

To return to the report:—"Skilled men are fully occupied in most sections with current work and there is a pronounced shortage of labour in certain sections. Much labour and material used in commercial building is not transferable to house building and could not be easily diverted. There should not be any restriction of private or commercial work in the interest of the community."

Of course, there is truth in these statements, but somehow I seem to see the subconscious mind of the business man at work in the construction of the report, assisted by the—a subconscious—desire of the worker to prot himself regardless of his fellow-workers in oth trades. I don't want to restrict anything, even housing for 15 years; but why the restr tions of private work should be more agai "the interest of the community" than the restr tion of housing I can't quite see. The organi worker is quite right to see that his trade is diluted in a panic, and so increased by spe effort that it may be flooded, and its earn capacity lessened by the competition of dilu overstocking the market in normal tin But will Parliament accept the recommendat that a Committee of interested persons shall to the man in the street, "your son shall enter any one of the dozen trades occupied building"? I had always thought that building trade employers, as a whole were gr supporters of "private enterprise"; but there be any need for enterprise under scheme of the report?

The impression left with me is that, hav made a great effort to apply itself to housi the Committee subconsciously dealt with position of those interested in the build industry, thinking it was the same thing, proving all the time that it isn't. Housing only a 10 per cent. interest.

The method for supply of labour again see to show the working of the subconscious mi To supply full demand for housing, restrict number of houses; until the new supply created when it will be put on housing (I won if it will release the best worker for commer or luxury building, which must not be stricted lest the heavens fall) unless requ for more profitable work. Although commer work be slack, and housing contracts so pres that higher wages are offered, the Governm must allow the Committee to prevent a tran lest the productive power of the builder commercial works be crippled by the depart of his men to housing. Will the workers supp their representatives in this recommendatio

If I may suggest some constructive critici I should say:—

(1) The Statutory Committee most certai should have an outside Chairman, and he sho be a lawyer of accepted ability.

(2) The Government, other industries cerned with building, and "the communi should be represented.

(3) The local authority and the commu should be represented on the local branch c mittees.

(4) In the report on materials I notice "50 basins"—a bath in every house may l necessity, but surely we might save the h pressed manufacturer from those 50,000 bas

(5) If something must be restricted I t luxury buildings should be so restricted b housing.

(6) I fear the Committee having menti 50,000 houses will be content with two-th of that number if the demand for comme buildings continues, as it probably will; housing requirements must not act adve to other sections of the industry. I w put it the other way, other work must not pre the full 50,000 houses being provided.

(7) Manufacturers undertake that suf shall be adequate, and increased produ should lower prices. Adequate to the n of the community or to the effortless produ of the manufacturer? Let the State sub the provision of material for housing, and encourage effort on the part of private enter

(8) The Committee have power not on check increases, but also to insist upo creases—otherwise is there likely to be a effort on the part of the producer?

(9) There is to be an Act of Parliame prevent anyone exploiting the situation. restrictions of output either of material or l be exploiting the situation? If so, let us a one clause Act of Parliament passed at or

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick-layers.	C'p'ters. Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barrow-in-Furness	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barry	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bath	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/1½
Bedford	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½
Birkenhead	1/9	1/9	1/8½	1/9	1/9	1/9	1/8½	1/4
Birmingham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bishop Auckland	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Blackburn	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Blackpool	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bolton	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bournemouth	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½
Bradford	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½

(For rates of wages in the Building Trade in Scotland, see page 701).

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.
